HAIR-POWDER (Ger. *Puder*; Fr. *Poudre à poudrer*; It. *Polvere di cipri*; Sp. *Polvos de peluca*) is used as an ornament for the hair, and generally made from starch pulverised, and sometimes perfumed. A tax of 1*l*. 3*s*. 6*d*. a year is laid upon all persons who wear hair-powder. Different statutes prohibit the mixing of hair-powder with starch or alabaster. And hair-powder makers are prohibited having alabaster in their custody.

HALIFAX, the capital of Nova Scotia, on the south-east coast of that province, lat. 44° 36′ N., lon. 63° 28′ W. It is situated on a peninsula on the west side of Chebucto Bay, and has one of the finest harbours in America. Population, exclusive of the military, about 19,000. The town is irregularly built, and most of the houses are of wood. The government-house is one of the most splendid edifices in North America. Halifax was founded in 1749.

Port.—The best mark in sailing for Halifax is Sambro light-house, on a small island off the cape of the same name, on the west side of the entrance to the harbour, in lat. 44° 30′., lon. 63° 32′. The light, which is fixed, is 210 feet above the level of the sea; and a detachment of artillery, with two 24-pounders, is upon duty at the light-house, firing at regular intervals during the continuance of the dense fogs with which this part of the coast is very much infested.—(*Coulier, Tables des Principales Positions Geographiques*, p. 78.) The course into the harbour for large ships after passing Sambro light, is between the main land on the west, and Macnab's island on the east. On a spit projecting from the latter a light-house has recently been constructed; and when this is seen, ships may run in without fear. The harbour is defended by several pretty strong forts. Ships usually anchor abreast of the town, where the harbour is rather more than a mile in width. After gradually narrowing to about ¼ of that width, it suddenly expands into a noble sheet of water, called Bedford Basin, completely land-locked, with deep water throughout, and capable of accommodating the whole navy of Great Britain. The harbour is accessible at all times, and is rarely impeded by ice. There is an extensive royal dockyard at Halifax; which during war is an important naval station, being particularly well calculated for the shelter, repair, and outfit of the fleets cruising on the American coast and in the West Indies. Mr. M'Gregor has severely, and, we believe, justly censured the project for the removal of the dockyard from Halifax to Bermuda.

Trade, &c. of Halifax and Nova Scotia.—Halifax is the seat of a considerable fishery; but the British colonists seem to be, for what reason it is not easy to say, less enterprising and successful fishers than the New Englanders. The principal trade of the town and province is with the West Indies, Great Britain and the United States. To the former they export dried and pickled fish, lumber, coals, grindstones, cattle, flour, butter, cheese, oats, potatoes, &c. They export the same articles to the southern ports of the United States, and gypsum to the eastern ports of New England. To Great Britain they send timber, deals; whale, cod, and seal oil; furs, &c. The principal exports of timber are from Pictou on the St. Lawrence. The imports consist principally of colonial produce from the West Indies; all sorts of manufactured goods from Great Britain; and of flour, lumber, &c. from the United States, principally for exportation to the West Indies.

In 1826 a company was formed for making a canal across the country from Halifax to the basin of Minas, which unites with the bottom of the Bay of Fundy. The navigation is formed, for the most part, by Shubenacadie lake and river. The legislature gave 15.000*l*. to this undertaking. The excavated part of the canal is 60 feet wide at top, 36 feet at bottom, and admits vessels drawing 8 feet water. It seems very questionable whether this canal will be profitable to the shareholders; but it is of very considerable service to the trade of Halifax.

There are two private banking companies at Halifax. Accounts are kept in pounds, shillings, and pence, the same as in England, and the weights and measures are also the same.

About 120 large square-rigged vessels, and about the same number of large schooners, with several smaller craft belong to Halifax.

The steam ships conveying the mails to British North America ply between this port and Boston in the U. States and Liverpool. They sail from the latter twice a month during the summer months but only once a month in winter. The fare to Halifax or Boston from Liverpool, including provisions and steward's fee (but excluding wines and liquors), is 39 guineas. On arriving at Halifax, passengers are conveyed by coaches across the Peninsula to Pictou, whence they are carried by steamers to Quebec and Montreal. A steam intercourse is also kept up in summer with Boston.

Account of the Value (in Sterling) of the Principal Articles Imported into and Exported from Nova Scotia, and principally into and from Halifax, in 1855 and 1856.

During 1856, 139 ships, of the agg. burden of 61,565 tons, entered the ports of the colony (principally Halifax) from the United Kingdom.

HAMS. See BACON and HAMS.

HAMBURG, a free Hanseatic city, on the north bank of the river Elbe, about 70 miles from its mouth, lat. 53° 32′ 51″ N., lon. 9° 58′ 37″ E. Population, in 1857, including the suburbs of St. George and St. Paul, but excluding the territory attached to the city, 169,718. Hamburg is the greatest commercial city of Germany, and, perhaps, of the Continent. She owes this distinction principally to her situation. The Elbe, which may be navigated by lighters as far as Melnik, in Bohemia, renders her the *entrepôt* of a vast extent of country. Advantage, too, has been taken of natural facilities that extend still further her internal navigation; a water communication having been established, by means of the Spree and of artificial cuts and sluices, between the Elbe and the Oder, and between the latter and the Vistula; so that a considerable part of the produce of Silesia destined for foreign markets, and some even of that of Poland, is conveyed to Hamburg. (See CANALS.) There is, also, a communication by means of the Steknitz canal, with the Trave, and, consequently, with Lubeck and the Baltic. But the great lines of railway which now unite Hamburg with Berlin, Leipsic, and all the interior of Germany, have vastly extended her connections, and are probably of even more importance than her command of river and canal navigation. Vessels drawing 14 feet water come up to the town at all times; and vessels drawing 18 feet may come safely up with the spring tides. The largest vessels sometimes load from and unload into lighters at Cuxhaven. The trade of Hamburg embraces every article that Germany either sells to or buys from foreigners. The imports consist principally of cotton wool, stuffs, and yarn; wool, woollen, and worsted goods; coffee, which is the favourite article for speculative purchases; sugar, silk and silk goods; tobacco, hides, iron, and hardware, machinery, indigo, wine, brandy, rum, dyewoods, tea, pepper, &c., very large quantities of coal are imported from the U. K. Being brought from many different places, there is a great variety of quality in the grain found at Hamburg; but a large proportion of the wheat is inferior. Some of the barley is very good, and fit for malting. The oats are feed of various qualities. With the exception of coal the exports consist of the same articles as the imports, Hamburg not being a centre of cousumption but of distribution. In addition to colonial produce, British manufactured goods and grain of all sorts, they include wool, clover seed, bark, spelter, cattle, butter, salted provisions, rags, wooden clocks and toys, linens, and all sorts of German manufactured goods, Rhenish wines, &c. Most sorts of Baltic articles, such as grain, flax, iron, pitch, and tar, wax, &c., may generally be bought as cheap at Hamburg, allowing for difference of freight, as in the ports whence they were originally brought. The total annual value of the import and export trade of the port (including that of Altona, the merchants of

which conduct their business on the Hamburg exchange) carried on by sea, may be estimated at above 50,000,000*l.* sterling a year, or upwards: and as the largest portion by far of this immense trade is in our hands, it will be necessary that we should be a little fuller than ordinary in our details in regard to this great emporium.

Hamburg was visited by a most destructive fire in May, 1842. But, notwithstanding the heavy losses that were in consequence incurred, and the paralysis it occasioned in trade and industry, the shock was less severe than might have been anticipated. The system of mutual insurance having been generally adopted, the proprietors of houses and other property were subjected to a tax, to defray the interest of a loan of 32 millions marks banco raised to indemnify the sufferers, and to enable them to rebuild their houses. And we are glad to have to state that all traces of the devastation have nearly disappeared; and that here, as in most other places exposed to a similar calamity, it has led to a great improvement of the town, which is now better built, and more commodiously laid out than formerly.

Navigation of the Elbe, Pilotage, &c. — The mouth of the Elbe is encumbered with sand banks. The channel leading to Cuxhaven is bounded on the north by the Vogel Sands and North Grounds, and on the south by the Schaarhorn Sands and Neuwerk Island. On the latter there are 2 lighthouses and 2 beacons, and on the Schaarhorn is another beacon. The lighthouses on Neuwerk Island are about 700 yards apart; the most southerly, which is also the most elevated, being in lat. 53° 54′ 57″ N., lon. 8° 29′ 40″ E. It is 128 feet high, being twice the height of the other. The channel is, in some places, hardly ⅔ of a mile wide. The outer red buoy in the middle of the channel, at its mouth, bears from Heligoland S. E. by S., distant nearly 20 miles. But the best mark in entering the Elbe is the floating light, or signal ship, moored 2 miles N. W. by N. of the red buoy, in 11 fathoms at low water. This vessel never leaves her station, unless compelled by ice in the winter season. By night she exhibits a lantern light, 38 feet above deck, and in foggy weather rings a bell every quarter of an hour. A second signal ship is stationed 5½ miles S. E. by E. from the first, at the westernmost point of a sand bank dividing the fair way of the river. She is rigged like a galliot, to distinguish her by day from the first signal ship; and during night she exhibits *two* lights, one 18 feet above the other. The distance from the outer red buoy to Cuxhaven is about 16 miles; thence to Glückstadt the course is east, 28 miles; from the latter to Stade the course is south-easterly, 9 miles; and then easterly to Hamburg, 18 miles. The channel throughout is marked with black and white buoys, which are numbered and specified in the charts. The black ones are to be left, in passing up the river, on the starboard or right-hand side, and the white on the larboard side.

All vessels coming from sea into the Elbe, and drawing over 4 feet water, must take a pilot on board; and however well the signals, lights, beacons, and buoys may be arranged, the services of an experienced pilot are very necessary, especially in the case of fogs, or stormy weather. To assist in getting vessels supplied with this indispensable functionary, a schooner was directed, in 1855, to cruise between Heligoland and the mouth of the river, to be in readiness to supply ships with pilots and instructions. And this plan having been found to answer extremely well, a second schooner has since been employed for the same purpose. Previously to this arrangement, vessels had to heave-to by the pilot-galliot, moored near the river's mouth, and when, owing to the state of the tide or the weather, they could not do this, they had to sail to Cuxhaven, and there get a pilot. But the schooners being extremely good sea-boats, and, always on the look-out, their employment has greatly reduced the inconveniences that formerly attended the shipping of pilots.

The charges on account of pilotage vary, of course, with the vessel's draught of water, the distance she has been piloted, and sometimes, also, with the nature of the cargo. They are in all cases very moderate. The charge for towage is fixed per agreement.

Down to a late period there were no docks or quays at Hamburg. Vessels moored in the river outside of piles driven into the ground a short distance from shore; and in this situation they were not exposed to any danger, unless the piles gave way, which rarely happens. There was a sort of inner harbour formed by an arm of the Elbe which runs into the city, where small craft discharged their cargoes. Larger vessels loaded and unloaded from their moorings, by means of lighters. These carry the goods from and to the warehouses which front the various small arms and channels of the river, and the canals carried from it into different parts of the city. The charges on account of lighterage are extremely moderate. But, whatever inconveniences may have attached to this state of things, either have been, or are on the eve of being, materially abated by the formation of a new harbour, in which ships will lie alongside the quays, and their loading and unloading be greatly facilitated.

Stade Duties.—In addition to the duties levied at Hamburg, all articles passing up the Elbe to that city, which are not the property of her citizens and conveyed in their ships, whether for transit or not, pay duties to Hanover. Previously to 1844 ships bound for Hamburg were obliged to heave-to at Brunshausen, near Stade, and to exhibit the manifests of their cargoes, bills of lading, and other particulars. But, at the epoch referred to, this vexatious proceeding was dispensed with. And the Stade duties, which have since been paid at Hamburg, were then, also, reduced and embodied in a tariff.

But despite this reduction they are still very considerable; and amounted, in 1855, to an average charge of 4*l.* 6*s.* 4*d.* per cargo of 100 tons conveyed to Hamburg in British ships. And as Hanover does nothing whatever either to improve or facilitate the navigation of the Elbe, a charge of this sort is much and justly objected to by our merchants; and notwithstanding the exemption in their favour, it is also much objected to by those of Hamburg. Nor is this to be wondered at. Since the repeal of the Sound dues the Stade duties have made many ships be sent to Stettin and other Baltic ports, that would otherwise have been sent to Hamburg. And that is not its only effect. For the Hanoverian government having exempted ships coming to Harburg, on the opposite side of the Elbe, from the duty, there has recently been a great influx of shipping to the latter, it, also, being connected by railways with Hanover and the interior of Germany. And in addition to the Stade toll, the navigation of the Elbe, above Ham-

burg, is seriously obstructed by tolls and regulations of one sort and another. Surely, however, it is high time that these offensive relics of a barbarous age were removed, and the navigation of this great inlet of Europe rendered quite free. And if no other means can be devised to effect so beneficial a purpose, the precedent of the abolition of the Sound dues may be advantageously followed; that is, a contribution may be raised by the nations whose ships frequent the Elbe, and by Hamburg, sufficient to buy up the tolls. It is as much, indeed, for the advantage of Prussia and Saxony as of England, or more, that all obstructions to the free navigation of the Elbe should be abolished. And instead of burdening it with tolls, they would, if they took an enlightened view of their own interests, repeal the latter, and assist Hamburg in deepening and improving the navigation of the river.

Money and Banks.—Money is generally reckoned in Hamburg in marcs, of 16s., each of 12 pfennings; and is of two sorts, *banco* and *current*. The former consists of the sums inscribed in the books of the Bank, opposite to the names of those who have deposited specie or bullion in the bank, or got it transferred to them at the rate of 27⅔ marcs banco to the Cologne marc of fine silver. The value of the marc banco, taking silver at 5*s.* an oz., is consequently 1*s.* 5½*d.*, which makes the par of exchange 13 marks 10½ schill. banco for 1*l.* sterling. There is always a considerable agio in favour of banco.

By a law passed in 1856, the Prussian dollar = 2½ marcs Hamburg currency, was made the only legal tender; and it was at the same time ordered that all payments contracted for in Hamburg currency should be made in Prussian dollars with an agio of 1 per cent. Hamburg is not to coin dollars, but merely pieces of 8, 4, 2, and 1 schillings.

In addition to the *Giro*, or Deposit Bank of Hamburg, which was founded so far back as 1619 (see *ante* p. 111.), two joint-stock banks were established here in 1856. One of these, the North German Bank, has a capital of 20,000,000 m. banco,=1,500,000*l.*, which has been wholly paid up. The capital of the other, or Union Bank, is nominally the same as that of the latter, but only 4,000,000 m. banco, or 300,000*l.*, of it has been paid up. They discount bills, make advances on goods, and transact all sorts of banking business.

Measures and Weights. A new regulation of these was effected by an act passed on the 16th January, 1843.

There were then in Hamburg 3 different sorts of *pound weights*.

1. The bank or silver weight (formerly the Cologne weight.)
2. The commercial weight.
3. The apothecary weight.

One pound bank, or silver weight, = 2 marks; 1 mark (Cologne) is 235·8489 grains, or 4865·57 Dutch As.=100 marks =62·6554 English troy pounds.

The old relation between the commercial weight and bank weight, by which the commercial pound was equal to $33\frac{5}{32}$ oz. bank weight has been confirmed by the act of 1843.

1 centner = 112 pounds; 1 pound = 32 oz.; 1 oz. = 4 *drachms*; 1 drachm 4 pfennings.

100 commercial lbs. =	106·838	English lbs. avoirdupois.
100	—	48·4609 kilogrammes.
100	—	86·5355 lbs. *Vienna*.
100	—	96·9219 lbs. *German* customs union.

1 "schiffpfund," in commerce, = 2½ centners, or 20 "liespfund" of 14 lbs. each, or 280 lbs.

1 "schiffpfund" by land carriage has 20 "liespfund," each of 16 pfund; is, therefore, = 320 lbs.

A pipe of oil is 820 lbs.; 1 barrel of butter (small willow and hoops) is taken at 224 lbs.; but with common hoops at 280 lbs. nett.

But the inconveniences of such a system are too obvious to require being pointed out. And to obviate them, provision was made in a treaty concluded in 1856, by the governments of Hamburg, Hanover, Brunswick, Bremen, &c. for the introduction of a uniform and simpler system of weights. These, which have since been brought into use, are 3·1759 per cent. heavier than the old ones; and their introduction, besides its other effects, has, of course, reduced the various duties charged by weight in this city, and the other countries referred to, in the proportion now stated.

Long Measure.—The Hamburg foot, divided into 12 inches, of 8 parts each, = 0·28657 metres, = 127·036 Parisian lines, = 11·289 Eng. inches. Hence

100 Hamburg feet =	94·021	Eng. feet.
100	—	28·657 French metres.
100	—	91·307 Prussian or Rheinish feet.
100	—	90·664 Vienna feet.

The Hamburg ell (short ell) = 2 Hamburg feet. 05·7514 metres = 254,072 Paris lines. 100 Hamburg ells = 62·681 Eng. yards.

The Brabant elle (or long ell) most commonly used in Hamburg, in measurement of piece goods, = 27·585 Eng. inches.

Liquid Measure.—1 fuder = 6 aums, 1½ aum = 4 ankers or 5 eimers; 1 anker = 5 viertels; 1 viertel = 2 stübchens; 1 stübchen = 2 kannens; 1 kannen = 2 quarters of Oessel; 1 eimer = 4 viertels; 1 hogshead = 1½ aums, or 6 ankers, or 30 viertels, each of 8 quarters or their Introduction, besides its

The stübchen contains 266 Hamburg cubic inches, = 3·62 litres.

100 Hamburg viertels = 159·39 English imperial gallons.
100 — 724·18 French litres.
100 — 632·45 Prussian quarters.
100 — 511·88 Vienna maass.

The full beer barrel contains 48 stübchens, or 192 quartiers; the small barrel only 32 stübchens, or 128 quartiers.

The vinegar barrel contains 30 stübchens, or 120 quartiers.

The whale and fish oil barrel contains 32 stübchens, or 128 quartiers; 2 whale oil barrels = 1 quarteel.

Grain Measure.—One last = 60 fass; 1 fass = 2 himpten; 1 himpten = 4 spint. The wispel of wheat, rye, and peas is 20 fass; but of oats and barley, 30 fass. The scheffel of wheat, rye, and peas, is 2 fass; of barley and oats, 3 fass.

The fass contains 3872 Hamburg cubic inches, = 52,731 litres, and 2658·45 Parisian cubic inches, and

100 Hamburg fass =	18·135	Imperial quarters.
100	—	42·734 hectolitres.
100	—	95·947 Prussian scheffels.
100	—	85·765 Austrian hetzen.

10 Hamburg lasts = 108·11 Imperial quarters.

The mode of measuring grain has hitherto been by the metres throwing or pitching it into the fass, and striking off the surplus with a wooden roller pressed lightly along the upper edge; but an alteration is expected on a new corn law, now projected, coming into operation; there will probably be a new fass measure (of 4035 Hamburg cubic inches), equal to the Prussian scheffel.

In practice, 1 Hamburg last is taken at 11 imperial quarters, 31 hectolitres, 57 Prussian scheffels, 25 Danish barrels, and 16½ Russian chetwerts.

The coal barrel contains (when the 1453 Hamburg cubic inches of head or heaped measure is added) 16,438 cubic inches.

The Hamburg ship last, or last of commerce, really weighs 6,000 pounds, or 3 tons (not 4,000 pounds, as is generally stated.)

The exports of grain from Hamburg depend in part on the harvests in the countries traversed by the Elbe, but more, perhaps, on the wants of this country. In our customs accounts, the imports of corn, &c. from the Hanseatic towns are given in the aggregate; but those from Hamburg amount to, full 2-3rds or 3-4ths of the whole.

The once important trade in German linens to Spain and her former American possessions, has of late years greatly fallen off. This is a consequence of the competition of England, who, by means of her superior machinery, is able, not only to spin, but to produce cloth cheaper than any other country. On the other hand, however, the import of linen yarns from England is being progressively augmented.

Lastage and Custom-house Charges.—British and other foreign vessels pay the same as Hamburg vessels. For clearing in and clearing out, no separate charges are made; visiting the port is considered as *one* voyage, and the charges on vessels are paid as follows:—

For vessels arrived with cargoes from the undermentioned places: viz.—

Places.	Last of 6,000 lbs.		
	Marcs.	£ *s. d*	
The East Indies	3	0	0 3 6
West Indies, North and South America	2	8	0 3 5
Portugal, Spain, and the Mediterranean	2	0	0 2 4
The rest of the European ports	1	8	0 1 9
Holland, East Friesland, the Weser, Eyder, and Jutland	0	12	0 0 10½
For vessels under 20 commercial lasts* without distinction	0	4	0 0 3½
Vessels arriving and departing in ballast, of upwards of 20 commercial lasts	0	8	0 0 7

* It is difficult to determine the exact ratio of a last to a ton, but it may be taken as about 3 or 2½ to 1. But in Hamburg all vessels are measured by the harbour-master; and it is upon his report that the lastage is calculated.

For all vessels laden with coals, wood, or turf, no lastage is paid, provided they do not take return cargoes.

Half Lastage.—Vessels arriving in ballast and departing with a cargo pay half the above lastage, according to their destination.

N. B.—Exclusive of the above dues, which are all remarkably moderate, vessels coming to the port of Hamburg are obliged to pay certain dues to Hanover, called Stade or Brunshausen dues. (See *post.*)

Duties.—The import and export duty was formerly 1½ per cent. (courant for banco, or 1½ on 125) on goods imported and exported by sea, and ½ ℔ cent. (courant for banco), for such as were received and transported by land or river conveyance; but for some years these duties have been greatly reduced, and are now only ½ ℔ cent. on imports, and ¼ ℔ cent. on exports. The greater part of the imports and exports are, however, entirely free even of these low duties, as is evident from the following statements:—

Goods entirely free of Duty on Import.

1. Linen, mixed linen, and cotton, linen and woollen rags, used and new made linen cloths, yarn and manufactured girths of flax, hemp, and cotton, sheep and lambs' wool.
2. Wheat, rye, barley, buckwheat, malt, potatoes, and rape-seed.
3. Unmanufactured copper and brass, ship's copper, old ditto for smelting, certain copper and brass waste, copper and brass plates, rough spelter, tinned and untinned iron plates.
4. Bullion and coins, unworked gold and silver, waste derived from the precious metals.
5. Printed works, books, music, and maps.
6. Oilcakes, bark, bones.
7. Passenger luggage, accompanied by proprietor, and otherwise, as may be allowed by the collectors of customs under particular circumstances.

Articles of Export exempted from Duty.

1. Millet, peas, beans, lentils, tares, spelt, aniseed, caraway seed, flour, madder, seed oils, arsenic, smalts, calamine, gypsum, black lead, mineral earths, mortar, mill stones, red stone, potters' clay, terras stone, tripoli, tophus stone, fullers' earth, brimstone, spelter in blocks and plates, and coals.
2. Wood for building, staves, and fire-wood, coming down the Elbe, or received landwards, the last being exempted when it has come originally by sea.
3. Articles arriving by post waggons, coming to one party, not above the value of 50 ℔ cent. banco.

All articles defined as *transitu goods* are likewise entirely free of duty if so declared at entry, whether imported on account of Hamburg citizens or of foreigners.

The privilege of *transitu* generally extends to a period of 3 months from the time of entry, but an extension of 3 months may be obtained on petition, by paying ¼ ℔ cent. courant for banco, on the value. Transit beyond a period of 6 months is not allowed.

The levy of duties in Hamburg is conducted in the simplest manner, and on the most liberal footing. No vexatious forms check the free intercourse or the free course of trade; the entry for duty is merely a declaration of the current value at the time; transitu articles remaining in warehouse for exportation, require a mere declaration to that effect by a burgher or citizen.

In levying duties, no advantage is claimed by Hamburg for vessels bearing her own flag; goods by all vessels, from whatever quarter of the world, paying the same duties. Commercial treaties have been concluded by Hamburg alone, or in conjunction with the two other free Hanseatic cities, with Great Britain, Prussia, the United States of America, Mexico, Venezuela, the Porte, Norway, and Sweden.

The low rates of duty in Hamburg is a proof of her anxious desire to encourage trade with all nations; and the more so when we consider the great expense she is put to in keeping up buoys along the Lower Elbe, and other necessary charges for the navigating that river; expenses which considerably exceed the total sum received for duties.

Custom-house Regulations.—On a vessel's arrival at Hamburg the broker reports her to the Custom-house, and gives his guarantee for payment of the duties, and delivers her papers; and, upon a receipt being produced for the Stade duties by the Hanoverian authorities at Hamburg, the vessel is allowed to unload. On clearing, a manifest of the outward cargo, together with the consul's certificate of the regularity of the ship's papers, must be produced at the Custom-house by the broker, who obtains in return a clearance certificate, authorising the vessel to go to sea.

Credit, Brokerage, &c.—Almost all goods are sold for ready money, with an allowance of 1 per cent. for discount. Sometimes, but not frequently, sales are made at 2 or 3 months' credit, and in such cases a higher price is obtained than for cash. Sometimes sugar is sold to the sugar baker at this credit.

Brokers are positively forbidden to act as merchants or factors. They are avenged by the Senate, and must conform to the established regulations.

Brokerage is paid wholly by the seller, and amounts to—

"Five sixths per cent. on cotton, cotton-twist, cocoa, cochineal, copper, hides, indigo, manufactured goods, nankeens, sugar, and tea *

"One per cent. on annotto, camphire, cinnamon, cards, moms*, cassia*, cloves*, drugs not denominated*, deer skins, dyewoods*, ginger*, jalap*, mace*, nutmegs*, pepper, pimento, potashes, Peruvian bark, quercitron bark, rice*, saltpetre, sarsaparilla*, shellac*, tamarinds*, tobacco in leaves* and tobacco stems*, of the growth of the United States of America, whale oil*, vanelloes*.

"*N.B.*—Tobacco stems* of all other origin, segars, and other manufactured tobacco, pay 2 per cent.; all other leaf and roll tobacco* 1½ per cent.

"One and a half per cent. on wine, brandy, rum, and arrack, if sold in parcels amounting to 3,000 marcs banco and upwards.

"Two per cent. on ditto, for sales of and under 3,000 marcs banco.

"In auction the selling broker is entitled to 1½ per cent. and the purchasing broker to 2 per cent., without regard to the amount."

All articles marked (*) pay the brokerage before mentioned, if the quantity sold amounts to 600 marcs banco, or higher; for smaller lots of less than 600 marcs banco, and down to 150 marcs banco, the brokerage is paid, with the addition of one half, and under 150 marcs banco, the double is allowed. All other merchandise pays 1½ per cent. at least for sales not exceeding 150 marcs banco.

It is, however, to be observed, that all augmentations, in proportion to the amount sold, are only to be understood for sale by private contract, and not for those by auction; and even not for such private sales, where a broker has made the purchase of a larger quantity of goods above the said amount of 600 marcs banco, and has afterwards divided it into smaller lots.

Conditions of Sale. Imports.—Coffee is sold per pound in schill. banco; discount, 1 per cent.; good weight is ½ per cent. Tare is as follows: viz. on casks, real weight: on bags of 130 lbs. or less, 2 lbs.; above 150 lbs. and not above 180 lbs., 3 lbs.; above 180 lbs. and not exceeding 200 lbs., 4 lbs. On Mocha bales of about 300 lbs., 14 lbs.; if 600 lbs., 50 lbs. On Bourbon single bales, 2 lbs.: on double, 4 lbs.

Cotton is sold per lb. in schill. banco; discount, 1 per cent.; good weight, 1 per cent.; tare on bales, West Indian and North American, 4 per cent.; on square bales, 6 per cent.; on Bombay and Surat bales, 8 per cent.; on Bourbon bales and Manilla serons, 6 per cent.; on Caraccas and Guiana small serons, 10 per cent. For the regulation of the Stade duty, all packages should be called bags, and not bales, in the bill of lading.

East India piece goods are sold per piece, in marcs banco; discount, 1 per cent. For saving in the Stade duty, if more than 30 pieces are in a bale, the number of pieces should not be mentioned in the bill of lading, but only the number of bales.

Flour is sold per 100 lbs. in marcs currency, uncertain agio; discount 1 per cent.; good weight, 4 per cent.; tare, 20 lbs. per barrel.

Fustic is sold per 100 lbs. in marcs currency, agio, 20 per cent.; discount, 1 per cent.; good weight, 1 per cent.; and frequently an allowance in weight is made, if the wood is not very solid.

Indigo is sold per lb. in schill. banco; discount, 1 per cent.; good weight, ½ per cent.; tare, if in serons upwards of 120 lbs., 22 lbs.; in ½ serons less than 120 lbs., 20 lbs.; in chests, real tare.

Logwood is sold like fustic.—*N.B.* To avoid a high Stade duty, the nett weight of all dyed woods should be stated in the bills of lading.

Pepper is sold per lb. in schill. banco; discount, 1 per cent.; good weight, ½ per cent.; tare, if in single bales of 300 lbs., 3 lbs.; in double bales, 6 lbs.

Quercitron bark is sold per 100 lbs. in marcs currency; agio 20 per cent.; discount, 2 per cent.; good weight, 1 per cent. To determine the tare, the American tare is reduced to Hamburg weight.

Rice is sold per 100 lbs. in marcs banco; discount, 1 per cent.; good weight, 1 per cent.; tare, real; and super-tare for tierces, 4 lbs.; for ½ tierces, 2 lbs.

Rum is sold per 30 quarts in rix doll. currency, agio uncertain.

Sugar, raw and clayed, is sold per lb. in banco groats, with a rebate of 8℔ per cent.; discount, 1 per cent., and sometimes 1½ per cent.; Brazil or Havannah chest, good weight, ½ per cent.; real tare; super-tare, 10 lbs. for Brazil, and 5 lbs. for Havannah sugar, per chest. Muscovados in casks, good weight, 1 per cent.; tare, if the casks weigh upwards of 1,000 lbs., 18 per cent., if less, 20 per cent. Clayed sugars, good weight, 1 per cent.; tare, 16 per cent. East India sugars, in bags, good weight, ¾ per cent.; tare for white, 4 to 5 lbs.; for brown, 6 to 7 lbs.

Tea, per lb. in schill. currency, agio uncertain: discount, 1 per cent.; good weight, ½ per cent. Tare of bohea, in chests, of 400 lbs., 70 lbs.; of 150 to 180 lbs., 45 lbs. All black tea, 28 lbs. tare; green, 24 lbs. For the regulation of the Stade duty, the nett weight should likewise be mentioned in the bill of lading.

Tobacco.—Leaf tobacco is sold per lb. in schill. banco, agio uncertain; discount, 1½ per cent.; good weight, 1 per cent.; tare per cask, 80 lbs. Brazil leaf in serons; tare, 5 per cent. In rolls; canister, in baskets of about 100 lbs.; good weight, 1 lb. per basket; tare, 14 lbs. if the basket is packed up in linen, and 12 lbs. if without linen. Porto Rico rolls, good weight, 1 per cent.; no tare, as the rolls are weighed by themselves. Brazil rolls, in serons of 400 to 600 lbs., are sold per lb., in schillings banco; good weight, ¾ per cent.; tare, 8 lbs. per seron. Tobacco stems per 100 lbs., in marcs currency, agio uncertain; discount, 1½ per cent.; good weight, 1 per cent.; tare, if in casks, real weight; if packed up with cords, 2 to 4 per cent. according to the thickness of the rope. As there is great difference in the Stade duty for the different sorts of tobacco, it is necessary that, on shipping leaf tobacco, there *should* be inserted in the bill of lading, *Leaf Tobacco*, omitting the weight. With tobacco in rolls, only the number of packages containing roll tobacco, and the nett weight, without mentioning the number of rolls, should appear in the bill of lading.

Glass (window) is sold per chest, in marcs banco uncertain; other glass ware per piece, dozen, or hundred, in schillings or marcs currency, with uncertain agio; discount, 1 per cent.

Hares, wool is sold per 2 lbs. in marcs currency, agio uncertain; discount, 1 per cent.

Hare skins (German, grey) are sold per 100 pieces, in rixdoll. banco, Russian, grey, per 104 pieces, in rixdoll. banco. White, in marcs currency, agio uncertain; discount, 1 per cent.

Iron is sold per 100 lbs. in schill. currency, agio uncertain; discount, 1 per cent.

Copper is sold per 100 lbs. in schill. banco; discount, 1 per ct.

The exchange business done at Hamburg is very great; for, besides the business of the place, most of the merchants in the inland towns have their bills negotiated there.

The usual charge for commission is, on sales 2 per cent. and 1 per cent. for *del credere*, if such guarantee be required; on purchases, 2 per cent Under particular agreements, the rates sometimes vary considerably from the above.

Citizenship.—Foreigners cannot establish themselves as merchants, or carry on any business in their own names, at Hamburg, without becoming burghers; and to be manufacturers, they must also enter the guild or corporation peculiar to the trade they mean to follow. But, to become a burgher, one has only to comply with certain forms and pay certain fees, which do not, in all, exceed 10*l*. He then becomes, in the eye of the law, a Hamburg subject, and enjoys all the rights and privileges of a native.

Insurance, &c.—All sorts of insurances are effected at Hamburg. A municipal regulation compels the insurance of all houses within the city, the rate varying according to the number of fires and the amount of loss. Marine insurance is principally effected by joint-stock companies, of which there are several; their competition has reduced the premiums to the lowest level, and the business is not understood to be profitable. The high duties on policies of insurance by this country has led to the insuring of a good many English ships at Hamburg. Life insurance is not prosecuted in Germany to any considerable extent; but some of the English companies have agents here, who are said not to be very scrupulous.

Bankruptcy.—Considering the vast number of merchants and tradespeople at Hamburg, bankruptcy is not, in general, of frequent occurrence.

Much of the business transacted at Hamburg being on commission and for account of houses abroad, the failure of foreign merchants is a prevalent source of bankruptcy. Another

source of bankruptcy is losses on goods imported or exported on speculation, and occasionally losses in the funds, in which a good deal of gambling goes on here. Expensive living is not nearly so prevalent a source of bankruptcy here as in London and other places.

The law of Hamburg makes 3 classes of bankrupts;—the unfortunate, the careless, and the fraudulent. The first class consists of those whose books show that misfortune alone has occasioned the bankruptcy; that the party has all along lived within his probable income, and can account to his assignees completely for all his losses. Whoever is adjudged by the court to belong to this class (which contains but few in number), is considered entirely free from his debts, and is not subject to be called upon hereafter. The second and most numerous class contains those termed "careless" bankrupts. These are persons who have entered into speculations exceeding their means, who have gone on for a considerable time after they found their affairs in arrear, who have lived beyond their income, have not kept their books in good order, and so forth. They are liable to be confined in prison for a period of 3 or 6 months; and, provided they have not paid a dividend of 40 per cent., may be called upon for payment of their debt after 5 years from their discharge. If a claim be made by any creditor after this lapse of time, the bankrupt is obliged to pay whatever sum he is able for the benefit of his creditors. He must swear that he cannot pay anything, or not above a certain sum, without depriving himself and his family of necessaries. Every 5 years the claim may be repeated. All careless bankrupts are disabled from holding offices of honour. The third class contains the "fraudulent" bankrupts, who are liable to be imprisoned, according to the extent of their frauds, for a limited period, or even for life, besides being rendered incapable of holding any office whatever. Should a bankrupt abscond, he is called upon by public advertisement to appear by a certain day, in default of which he is adjudged a fraudulent bankrupt, and his name is posted up on a black board on the Exchange.

The obstructions and dangers that attach to the navigation of the Elbe, have long been a subject of anxious consideration to the Senate and people of Hamburg. Hitherto, however, but little has been done to effect any material improvement; and the difficulties to be overcome are so very great, and the expense that would have to be incurred so very heavy, that it is not, perhaps, very likely that anything on a great scale will be speedily attempted. A plan for deepening the channel of the river and forming a new harbour at Cuxhaven, to be accomplished at an estimated expense of 640,000*l.*, was proposed by Mr. Rendell, C.E., in 1854. But the death of that gentleman, and the all but universal belief that the expense would really exceed twice or three times the estimated sum, have hitherto prevented any steps being taken in the matter. No doubt, however, it is one of vital importance not merely to Hamburg, but to all Germany, and, in some measure, to the commercial world.

The Quarantine Regulations that were formerly enforced at Hamburg were not a little oppressive. But we are glad to have to state that they were repealed in 1856, and that a new and comparatively liberal code has been enacted in their stead. The latter directs that no vessels save those from the Black Sea, Turkey, and certain specified portions of the Mediterranean, or from ports declared by the Senate to be suspected, are to be subjected to quarantine at Cuxhaven. And these, except under very suspicious circumstances, are to be immediately set free. The old charges have, also, been abolished; and those adopted in their stead are extremely moderate.

Account of the Arrivals and Departures of Shipping at Hamburg in 1857.

Commercial Crisis of 1857.—This crisis was more severely felt here than anywhere else, either in Europe or America. The system of overtrading, which had been gaining ground at Hamburg for a considerable time, was greatly extended in 1854 and 1855, but more especially in 1856, and the earlier portion of 1857. In these years all sorts of bills were readily

negotiated; so that people without any, or with but little capital, became possessed of funds, and were enabled to enter into all sorts of undertakings. The result was such as uniformly follows on the like occasions. It appears from returns that are believed to be nearly accurate, that the bill liabilities of the Hamburg merchants, which amounted in 1853, to 133,173,000 m. banco (nearly 10,000,000*l.*), had increased in January, 1857, to 278,268,000 m. banco (18,620,000*l.*), and that in the middle of November, on the eve of the crisis, they amounted to 281,302,500 m. banco (21,097,688*l.*)! And this increase of bills was necessarily accompanied by a great increase in the price of most sorts of produce; which, however, was said to be occasioned by the influx of Australian and Californian gold! But the process of inflation cannot be indefinitely carried on. And the fall of some London houses, connected with the Hamburg and Swedish trade, led to the immediate bursting of the bubble. Overweening confidence gave way to the most unreasonable apprehensions. The government of the city made every effort to support the credit of some of the suspected houses; and even applied for and obtained from the Austrian government a loan of 15 millions m. banco to assist them in their object. But nothing could support that which had no real foundation. The mushroom firms that had overtraded to the greatest extent were the first to fall. And in their fall they shook, and in some cases destroyed, the credit even of those houses that had managed their concerns with the greatest prudence. In all about 220 houses suspended payments in the course of about two months. Of these about 50 were subsequently declared bankrupts; but the others

The principal trade between the United Kingdom and Hamburg is carried on through Hull, a regular communication being maintained between them by lines of steamers that sail twice a week or oftener. She is connected in the same way with London, Liverpool, Newcastle, Leith, and Dundee. Her trade with New York and other American ports, which is partly carried on by steamers, and partly by sailing ships, is, also, very extensive. The same may be said of her trade with Havre, and the principal continental ports. She has, further, some trade with India, China, and the Eastern Archipelago.

having made private arrangements with their creditors, under the sanction of a law passed for the purpose, the losses they sustained are not known. It is almost needless to add that the rate of discount, which had risen to an enormous height, and the prices of commodities, immediately fell back to their ordinary level.

But severe as this crisis was at the moment, its effect has been most salutary. It has put an end, at least for a while, to the wild speculation and overtrading, that is inconsistent with all sound commercial pursuits. And it is to be hoped that the government and people of the town will exert themselves to prevent a revival of so ruinous a system, by subjecting those whose bankruptcies may be traced to recklessness, either in overtrading or in expenditure, to the severest penalties.

We have derived the materials for this article from various sources; but principally from the communications of eminent merchants, and the able and elaborate reports of Colonel Hodges, H.M. consul at Hamburg.

HANSEATIC LEAGUE, an association of the principal cities in the north of Germany, Prussia, &c., for the better carrying on of commerce, and for their mutual safety and defence. This confederacy, so celebrated in the early history of modern Europe, contributed in no ordinary degree to introduce the blessings of civilisation and good government into the North. The extension and protection of commerce was, however, its main object; and hence a short account of it may not be deemed misplaced in a work of this description.

Origin and Progress of the Hanseatic League. — Hamburg, founded by Charlemagne in the ninth, and Lubeck, founded about the middle of the twelfth century, were the earliest members of the League. The distance between them not being very considerble, and being alike interested in the repression of those disorders to which most parts of Europe, and particularly the coast of the Baltic, were a prey in the twelfth, thirteenth, and fourteenth centuries, they early formed an intimate political union, partly in the view of maintaining a safe intercourse by land with each other, and partly for the protection of navigation from the attacks of the pirates, with which every sea was at that time infested. There is no very distinct evidence as to the period when this alliance was consummated; some ascribe its origin to the year 1169, others to the year 1200, and others to the year 1241. But the most probable opinion seems to be, that it would grow up by slow degrees, and be perfected according as the advantage derivable from it became more obvious. Such was the origin of the Hanseatic League, so called from the old Teutonic word *hansa*, signifying an association or confederacy.

Adam of Bremen, who flourished in the eleventh century, is the earliest writer who has given any information with respect to the commerce of the countries lying round the Baltic. And from the errors into which he has fallen in describing the northern and eastern shores of that sea, it is evident they had been very little frequented and not at all known in his time. But from the beginning of the twelfth century, the progress of commerce and navigation in the North was exceedingly rapid. The countries which stretch along the bottom of the Baltic, from Holstein to Russia, and which had been occupied by barbarous tribes of Sclavonic origin, were then subjugated by the kings of Denmark, the dukes of Saxony, and other princes. The greater part of the inhabitants being exterminated, their place was filled by German colonists, who founded the towns of Stralsund, Rostock, Wismar, &c. Prussia and Poland were afterwards subjugated by the Christian princes and the Knights of the Teutonic Order. So that, in a comparatively short period, the foundations of civilisation and the arts were laid in countries whose barbarism had ever remained impervious to the Roman power.

The cities that were established along the coast of the Baltic, and even in the interior of the countries bordering upon it, eagerly joined the Hanseatic confederation. They were indebted to the merchants of Lubeck for supplies of the commodities produced in more civilised countries, and they looked up to them for protection against the barbarians by whom they were surrounded. The progress of the League was in consequence singularly rapid. Previously to the end of the thirteenth century, it embraced every considerable city in all those vast countries extending from Livonia to Holland, and was a match for the most powerful monarchs.

The Hanseatic confederacy was at its highest degree of power and splendour during the fourteenth and fifteenth centuries. It then comprised from 60 to 80 cities, which were distributed into 4 classes or circles. Lubeck was at the head of the first circle, and had under it Hamburg, Bremen, Rostock, Wismar, &c. Cologne was at the head of the second circle, with 29 towns under it. Brunswick was at the head of the third circle, consisting of 13 towns. Dantzic was at the head of the fourth circle, having under it 8 towns in its vicinity, besides several that were more remote. The supreme authority of the League was vested in the deputies of the different towns assembled in congress. In it they discussed all their measures; decided upon the sum that each city should contribute to the common fund; and upon the questions that arose between the confederacy and other powers, as well as those that frequently arose between the different members of the confederacy. The place for the meeting of congress was not fixed, but it was most frequently held at Lubeck, which was considered as the capital of the League, and there its archives were kept. Sometimes, however, congresses were held at Hamburg, Cologne, and other towns. They met once every 3 years, or oftener if occasion required. The letters of convocation specified the principal subjects which would most probably be brought under discussion. Any one might be chosen for a deputy; and the congress consisted not of merchants only, but also of clergymen, lawyers, artists, &c. When the deliberations were concluded, the decrees were formally communicated to the magistrates of the cities at the head of each circle, by whom they were subsequently communicated to those below them; and the most vigorous measures were adopted for carrying them into effect. One of the burgomasters of Lubeck presided at the meetings of congress; and during the recess the magistrates of that city had the sole, or at all events the principal, direction of the affairs of the League.

Besides the towns already mentioned, there were others that were denominated confederated cities, or allies. The latter neither contributed to the common fund of the League, nor sent deputies to congress,; even the members were not all on the same footing in respect to privileges: and the internal commotions by which it was frequently agitated, partly originating in this cause, and partly in the discordant interests and conflicting pretensions of the different cities, materially impaired the power of the confederacy. But in despite of these disadvantages, the League succeeded for a lengthened period, not only in controlling its own refractory members, but in making itself respected and dreaded by others. It produced able generals and admirals, skilful politicians, and some of the most enterprising, successful, and wealthy merchants of modern times.

As the power of the confederated cities was increased and consolidated, they became more ambitious. Instead of limiting their efforts to the mere advancement of commerce and their own protection, they endeavoured to acquire the monopoly of the trade of the North, and to exercise the same sort of dominion over the Baltic that the Venetians exercised over the Adriatic. For this purpose they succeeded in obtaining, partly in return for loans of money, and partly by force, various privileges and immunities from the northern sovereigns, which secured to them almost the whole foreign commerce of Scandinavia, Denmark, Prussia, Poland, Russia, &c. They exclusively carried on the herring fishery of the Sound, at the same time that they endeavoured to

obstruct and hinder the navigation of foreign vessels in the Baltic. It should, however, be observed, that the immunities they enjoyed were mostly indispensable to the security of their commerce, in consequence of the barbarism that then prevailed; and notwithstanding their attempts at monopoly, there cannot be the shadow of a doubt that the progress of civilisation in the North was prodigiously accelerated by the influence and ascendancy of the Hanseatic cities. They repressed piracy by sea and robbery by land, which must have broken out again had their power been overthrown before civilisation was fully established; they accustomed the inhabitants to the principles, and set before them the example, of good government and subordination; they introduced amongst them conveniences and enjoyments unknown by their ancestors, or despised by them, and inspired them with a taste for literature and science; they did for the people round the Baltic, what the Phœnicians had done in remoter ages for those round the Mediterranean, and deserve, equally with them, to be placed in the first rank amongst the benefactors of mankind.

"In order," as has been justly observed, "to accomplish their purpose of rendering the Baltic a large field for the prosecution of commercial and industrious pursuits, it was necessary to instruct men, still barbarous, in the rudiments of industry, and to familiarise them in the principles of civilisation. These great principles were laid by the confederation, and at the close of the fifteenth century the Baltic and the neighbouring seas had, by its means, become frequented routes of communication between the North and the South. The people of the former were enabled to follow the progress of the latter in knowledge and industry. The forests of Sweden, Poland, &c. gave place to corn, hemp, and flax; the mines were wrought, and in return the produce and manufactures of the south were imported. Towns and villages were erected in Scandinavia, where huts only were before seen: the skins of the bear and the wolf were exchanged for woollens, linens, and silks: learning was introduced; and printing was hardly invented before it was practised in Denmark, Sweden, &c."—(*Catteau, Tableau de la Mer Baltique*, tom. ii. p. 175.)

The kings of Denmark, Sweden, and Norway were frequently engaged in hostilities with the Hanse towns. They regarded, and, it must be admitted, not without pretty good reason, the privileges acquired by the League, in their kingdoms, as so many usurpations. But their efforts to abolish these privileges served, for more than 2 centuries, only to augment and extend them.

"On the part of the League there was union, subordination, and money; whereas the half-savage Scandinavian monarchies were full of divisions, factions, and troubles; revolution was immediately followed by revolution, and feudal anarchy was at its height. There was another circumstance, not less important, in favour of the Hanseatic cities. The popular governments established amongst them possessed the respect and confidence of the inhabitants, and were able to direct the public energies for the good of the state. The astonishing prosperity of the confederated cities was not wholly the effect of commerce. To the undisciplined armies of the princes of the North—armies composed of vassals without attachment to their lords—the cities opposed, besides the inferior nobles, whose services they liberally rewarded, citizens accustomed to danger, and resolved to defend their liberties and property. Their military operations were combined and directed by a council composed of men of tried talents and experience, devoted to their country, responsible to their fellow citizens, and enjoying their confidence. It was chiefly, however, on their marine forces that the cities depended. They employed their ships indifferently in war or commerce, so that their naval armaments were fitted out at comparatively small expense. Exclusive, too, of these favourable circumstances, the fortifications of the principal cities were looked upon as impregnable; and as their commerce supplied them abundantly with all sorts of provisions, it need not excite our astonishment that Lubeck alone was able to carry on wars with the surrounding monarchs, and to terminate them with honour and advantage; and still less that the League should long have enjoyed a decided preponderance in the North."—(*L'Art de vérifier les Dates*, 3me partie, tom. viii. p. 204.)

The extirpation of piracy was one of the objects which had originally led to the formation of the League, and which it never ceased to prosecute. Owing, however, to the barbarism then so universally prevalent, and the countenance openly given by many princes and nobles to those engaged in this infamous profession, it was not possible wholly to root it out. But the vigorous efforts of the League to abate the nuisance, though not entirely successful, served to render the navigation of the North Sea and the Baltic comparatively secure, and were of signal advantage to commerce. Nor was this the only mode in which the power of the confederacy was directly employed to promote the common interests of mankind. Their exertions to protect shipwrecked mariners from the atrocities to which they had been subject, and to procure the restitution of shipwrecked property to its legitimate owners, though, most probably, like their exertions to repress piracy, a consequence of selfish considerations, were in no ordinary

degree meritorious; and contributed not less to the advancement of civilisation than to the security of navigation.*

Factories belonging to the League. — In order to facilitate and extend their commercial transactions, the League established various factories in foreign countries; the principal of which were at Novogorod in Russia, London, Bruges in the Netherlands, and Bergen in Norway.

Novogorod, situated at the confluence of the Volkof with the Imler Lake, was, for a lengthened period, the most renowned emporium in the north-eastern parts of Europe. In the beginning of the eleventh century, the inhabitants obtained considerable privileges that laid the foundation of their liberty and prosperity. Their sovereigns were at first subordinate to the grand dukes or czars of Russia; but as the city and the contiguous territory increased in population and wealth, they gradually usurped an almost absolute independency. The power of these sovereigns over their subjects seems, at the same time, to have been exceedingly limited; and, in effect, Novogorod ought rather to be considered as a republic under the jurisdiction of an elective magistrate, than as a state subject to a regular line of hereditary monarchs, possessed of extensive prerogatives. During the 12th, 13th, and 14th centuries, Novogorod formed the grand *entrepôt* between the countries to the east of Poland and the Hanseatic cities. Its fairs were frequented by an immense concourse of people from all the surrounding countries, as well as by numbers of merchants from the Hanse towns, who engrossed the greater part of its foreign commerce, and who furnished its markets with the manufactures and products of distant countries. Novogorod is said to have contained, during its most flourishing period, towards the middle of the 15th century, upwards of 400,000 souls. This, however, is most probably an exaggeration. But its dominions were then very extensive; and its wealth and power seemed so great and well established, and the city itself so impregnable, as to give rise to a proverb, Who can resist the Gods and great Novogorod? *Quis contra Deos et magnam Novogordiam?* — (*Coxe's Travels in the North of Europe*, vol. ii. p. 80.)

But its power and prosperity were far from being so firmly established as its eulogists, and those who had only visited its fairs, appear to have supposed. In the latter part of the 15th century, Ivan Vassilievitch, czar of Russia, having secured his dominions against the inroads of the Tartars, and extended his empire by the conquest of some of the neighbouring principalities, asserted his right to the principality of Novogorod, and supported his pretensions by a formidable army. Had the inhabitants been animated by the spirit of unanimity and patriotism, they might have defied his efforts; but their dissensions facilitated their conquest, and rendered them an easy prey. Having entered the city at the head of his troops, Ivan received from the citizens the charter of their liberties, which they either wanted courage or inclination to defend, and carried off an enormous bell to Moscow, that has been long regarded with a sort of superstitious veneration as the palladium of the city. But notwithstanding the despotism to which Novogorod was subject, during the reigns of Ivan and his successors, it continued for a considerable period to be the largest as well as most commercial city in the Russian empire. The famous Richard Chancellour, who passed through Novogorod in 1554, in his way from the court of the czar, says, that "next unto Moscow, the city of Novogorod is reputed the chiefest of Russia; for although it be in majestie inferior to it, yet in greatness it goeth beyond it. It is the chiefest and greatest mart town of all Muscovy; and albeit the emperor's seat is not there, but at Moscow, yet the commodiousness of the river falling into the Gulf of Finland, whereby it is well frequented by merchants, makes it more famous than Moscow itself."

But the scourge of the destroyer soon after fell on this celebrated city. Ivan IV., having discovered, in 1570, a correspondence between some of the principal citizens and the King of Poland, relative to a surrender of the city into his hands, punished them in the most inhuman manner. The slaughter by which the bloodthirsty barbarian sought to satisfy his revenge was alike extensive and indiscriminating. The crime of a few citizens was made a pretext for the massacre of 25,000 or 30,000. Novogorod never recovered from this dreadful blow. It still, however, continued to be a place of considerable trade, until the foundation of Petersburg, which immmediately became the seat of that commerce that had formerly centred at Novogorod. The degradation of this ill-fated city is now complete. It is at present an inconsiderable place, with a population of about 7,000 or 8,000; and is remarkable only for its history and antiquities.

The merchants of the Hanse towns, or Hansards, as they were then commonly termed, were established in London at a very early period, and their factory here was

* A series of resolutions were unanimously agreed to by the merchants frequenting the port of Wisby, one of the principal emporiums of the League, in 1287, providing for the restoration of shipwrecked property to its original owners, and threatening to eject from the "*consodalitate mercatorum*," any city that did not act conformably to the regulations laid down.

of considerable magnitude and importance. They enjoyed various privileges and immunities; they were permitted to govern themselves by their own laws and regulations; the custody of one of the gates of the city (Bishopsgate) was committed to their care; and the duties on various sorts of imported commodities were considerably reduced in their favour. These privileges necessarily excited the ill-will and animosity of the English merchants. The Hansards were every now and then accused of acting with bad faith; of introducing commodities as their own that were really the produce of others, in order to enable them to evade the duties with which they ought to have been charged; of capriciously extending the list of towns belonging to the association; and obstructing the commerce of the English in the Baltic. Efforts were continually making to bring these disputes to a termination; but as they really grew out of the privileges granted to and claimed by the Hansards, this was found to be impossible. The latter were exposed to many indignities; and their factory, which was situated in Thames Street, was not unfrequently attacked. The League exerted themselves vigorously in defence of their privileges; and having declared war against England, they succeeded in excluding our vessels from the Baltic, and acted with such energy, that Edward IV. was glad to come to an accommodation with them, on terms which were any thing but honourable to the English. In the treaty for this purpose, negotiated in 1474, the privileges of the merchants of the Hanse towns were renewed, and the king assigned to them, in absolute property, a large space of ground, with the buildings upon it, in Thames Street, denominated the Steel Yard, whence the Hanse merchants have been commonly denominated the Association of the Steel Yard; the property of their establishments at Boston and Lynn was also secured to them; the king engaged to allow no stranger to participate in their privileges; one of the articles bore that the Hanse merchants should be no longer subject to the Judges of the English Admiralty Court, but that a particular tribunal should be formed for the easy and speedy settlement of all disputes that might arise between them and the English; and it was further agreed that the particular privileges awarded to the Hanse merchants should be published as often as the latter judged proper, in all the sea-port towns of England, and such Englishmen as infringed upon them should be punished. In return for these concessions, the English acquired the liberty of freely trading in the Baltic, and especially in the port of Dantzic and in Prussia. In 1498, all direct commerce with the Netherlands being suspended, the trade fell into the hands of the Hanse merchants, whose commerce was in consequence very greatly extended. But, according as the spirit of commercial enterprise awakened in the nation, and as the benefits resulting from the prosecution of foreign trade came to be better known, the privileges of the Hanse merchants became more and more obnoxious. They were in consequence considerably modified in the reigns of Henry VII. and Henry VIII., and were at length wholly abolished in 1597.—(*Anderson's Hist. Com.* Anno 1474, &c.)

The different individuals belonging to the factory in London, as well as those belonging to the other factories of the League, lived together at a common table, and were enjoined to observe the strictest celibacy. The direction of the factory in London was intrusted to an alderman, 2 assessors, and nine councillors. The latter were sent by the cities forming the different classes into which the League was divided. The business of these functionaries was to devise means for extending and securing the privileges and commerce of the association; to watch over the operations of the merchants; and to adjust any disputes that might arise amongst the members of the confederacy, or between them and the English. The League endeavoured at all times to promote, as much as possible, the employment of their own ships. In pursuance of this object, they went so far, in 1447, as to forbid the importation of English merchandise into the confederated cities, except by their own vessels. But a regulation of this sort could not be carried into full effect; and was enforced or modified according as circumstances were favourable or adverse to the pretensions of the League. Its very existence was, however, an insult to the English nation; and the irritation produced by the occasional attempts to act upon it, contributed materially to the subversion of the privileges the Hanseatic merchants had acquired amongst us.

By means of their factory at Bergen, and of the privileges which had been either granted to or usurped by them, the League enjoyed for a lengthened period the monopoly of the commerce of Norway.

But the principal factory of the League was at Bruges in the Netherlands. Bruges became, at a very early period, one of the first commercial cities of Europe, and the centre of the most extensive trade carried on to the north of Italy. The art of navigation in the thirteenth and fourteenth centuries was so imperfect, that a voyage from Italy to the Baltic and back again could not be performed in a single season; and hence, for the sake of their mutual convenience, the Italian and Hanseatic merchants determined on establishing a magazine or storehouse of their respective products in some intermediate situation. Bruges was fixed upon for this purpose; a distinction

which it seems to have owed as much to the freedom enjoyed by the inhabitants, and the liberality of the government of the Low Countries, as to the conveniency of its situation. In consequence of this preference, Bruges speedily rose to the very highest rank among commercial cities, and became a place of vast wealth. It was at once a staple for English wool, for the woollen and linen manufactures of the Netherlands, for the timber, hemp and flax, pitch and tar, tallow, corn, fish, ashes, &c. of the North; and for the spices and Indian commodities, as well as their domestic manufactures imported by the Italian merchants. The fairs of Bruges were the best frequented of any in Europe. Ludovico Guicciardini mentions, in his *Description of the Low Countries*, that, in the year 1318, no fewer than 5 Venetian galleases, vessels of very considerable burden, arrived at Bruges in order to dispose of their cargoes at the fair. The Hanseatic merchants were the principal purchasers of Indian commodities; they disposed of them in the ports of the Baltic, or carried them up the great rivers into the heart of Germany. The vivifying effects of this commerce were every where felt; the regular intercourse opened between the nations in the north and south of Europe made them sensible of their mutual wants, and gave a wonderful stimulus to the spirit of industry. This was particularly the case with regard to the Netherlands. Manufactures of wool and flax had been established in that country as early as the age of Charlemagne; and the resort of foreigners to their markets, and the great additional vent that was thus opened for their manufactures, made them be carried on with a vigour and success that had been hitherto unknown. These circumstances, combined with the free spirit of their institutions, and the moderation of the government, so greatly promoted every elegant and useful art, that the Netherlands early became the most civilised, best cultivated, richest, and most populous country of Europe.

Decline of the Hanseatic League.— From the middle of the fifteenth century, the power of the confederacy, though still very formidable, began to decline. This was not owing to any misconduct on the part of its leaders, but to the progress of that improvement it had done so much to promote. The superiority enjoyed by the League resulted as much from the anarchy, confusion, and barbarism that prevailed throughout the kingdoms of the North, as from the good government and order that distinguished the towns. But a distinction of this sort could not be permanent. The civilisation which had been at first confined to the cities, gradually spread from them, as from so many centres, over the contiguous country. Feudal anarchy was every where superseded by a system of subordination; arts and industry were diffused and cultivated; and the authority of government was at length firmly established. This change not only rendered the princes, over whom the League had so frequently triumphed, superior to it in power; but the inhabitants of the countries amongst which the confederated cities were scattered, having learned to entertain a just sense of the advantages derivable from commerce and navigation, could not brook the superiority of the association, or bear to see its members in possession of immunities of which they were deprived: and in addition to these circumstances, which must speedily have occasioned the dissolution of the League, the interests of the different cities of which it consisted became daily more and more opposed to each other. Lubeck, Hamburg, Bremen, and the towns in their vicinity, were latterly the only ones that had any interest in its maintenance. The cities in Zealand and Holland joined it, chiefly because they would otherwise have been excluded from the commerce of the Baltic; and those of Prussia, Poland, and Russia did the same, because, had they not belonged to it, they would have been shut out from all intercourse with strangers. When, however, the Zealanders and Hollanders became sufficiently powerful at sea to be able to vindicate their right to the free navigation of the Baltic by force of arms, they immediately seceded from the League; and no sooner had the ships of the Dutch, the English, &c. begun to trade directly with the Polish and Prussian Hanse towns, than these nations also embraced the first opportunity of withdrawing from it. The fall of this great confederacy was really, therefore, a consequence of the improved state of society, and of the development of the commercial spirit in the different nations of Europe. It was most serviceable so long as those for whom its merchants acted as factors and carriers were too barbarous, too much occupied with other matters, or destitute of the necessary capital and skill, to act in these capacities for themselves. When they were in a situation to do this, the functions of the Hanseatic merchants ceased as a matter of course; their confederacy fell to pieces; and at the middle of the seventh century the cities of Lubeck, Hamburg, and Bremen were all that continued to acknowledge the authority of the League. Even to this day they preserve the shadow of its power; being acknowledged in the act for the establishment of the Germanic confederation, signed at Vienna, the 8th of June, 1815, as free Hanseatic cities. —(From an article in No. 13. of the *Foreign Quarterly Review*, contributed by the author of this work.)

HARBOUR, HAVEN, or PORT, a piece of water communicating with the sea, or with a navigable river or lake, having depth sufficient to float ships of considerable

burden, where there is convenient anchorage, and where ships may lie, load, and unload, screened from the winds, and without the reach of the tide.

Qualities of a good Harbour. — There is every variety in the form and quality of harbours. They are either natural or artificial; but, however formed, a good harbour should have sufficient depth of water to admit the largest ships at all times of the tide; it should be easy of access, without having too wide an entrance; the bottom should be clean and good; and ships should be able to lie close alongside quays or piers, that the expense and inconvenience of loading and unloading by means of lighters may be avoided. Ships lying in a harbour that is land-locked, and surrounded by high grounds or buildings, are, at once, without the reach of storms, tides, and currents; and may, in most cases, be easily protected from hostile attacks. Bar harbours are those that have bars or banks at their entrances, and do not, therefore, admit of the ingress or egress of large ships except at high water. These are most commonly river harbours; the sand and mud brought down by the stream, and driven back by the waves, naturally forming a bar or bank at their mouths.

Best British Harbours. — Good harbours are of essential importance to a maritime nation; and immense sums have been expended in all countries ambitious of naval or commercial greatness in their improvement and formation. Portsmouth, Milford Haven, and the Cove of Cork are the finest harbours in the British islands, being surpassed by very few, if any, in the world. Of these, Portsmouth is entitled to the pre-eminence. This admirable harbour is about as wide at its mouth as the Thames at Westminster Bridge, expanding within into a noble basin, almost sufficient to contain the whole navy of Great Britain. Its entrance is unobstructed by any bar or shallow; and it has, throughout, water adequate to float the largest men of war at the lowest tides. The anchorage ground is excellent, and it is entirely free from sunken rocks, sand banks, or any similar obstructions. The western side of the harbour is formed by the island of Portsea; and on its south-western extremity, at the entrance to the harbour, is situated the town of Portsmouth, and its large and important suburb Portsea. Here are docks and other establishments for the building, repair, and outfit of ships of war, constructed upon a very large scale, and furnished with every convenience. The fortifications that protect this great naval *depôt* are superior, both as respects strength and extent, to any other in the kingdom. "Thus," to use the words of Dr. Campbell, "it appears that Portsmouth derives from nature all the prerogatives the most fertile wits and most intelligent judges could devise or desire; and that these have been well seconded by art, without consideration of expense, which, in national improvements, is little to be regarded. Add to all this the striking excellence of its situation, which is such as if Providence had expressly determined it for that use to which we see it applied, — the bridling the power of France, and, if I may so speak, the peculiar residence of Neptune." — (*Survey of Great Britain*, vol. i. p. 370.)

Portsmouth harbour has the additional and important advantage of opening into the celebrated road of Spithead, between the Hampshire coast and the Isle of Wight, forming a safe and convenient retreat for the largest fleets.

Milford Haven deeply indents the southern part of Pembrokeshire. It is of great extent, and has many subordinate bays, creeks, and roads. The water is deep, and the anchorage ground excellent; and being completely land-locked, ships lie as safely as if they were in dock.

Cork harbour has a striking resemblance to that of Portsmouth, but is of larger extent; it has, like it, a narrow entrance, leading into a capacious basin, affording a secure asylum for any number of ships.

Plymouth, which, after Portsmouth, is the principal naval *depôt* of England, has an admirable double harbour. The roadstead in Plymouth Sound has recently been much improved by the construction, at a vast expense, of a stupendous breakwater more than 1,700 yards in length. This artificial bulwark protects the ships lying inside from the effects of the heavy swell thrown into the Sound by southerly and south-easterly winds.

London stands at the head of the river ports of Great Britain. Considering the limited course of the Thames, there is, probably, no river that is navigable for large ships to so great a distance from sea, or whose mouth is less obstructed by banks. London is mainly indebted for her unrivalled magnitude to her favourable situation on this noble river; which not only gives her all the advantages of an excellent port, accessible at all times to the largest ships, but renders her the emporium of the extensive, rich, and populous country comprised in the basin of the Thames.

The Mersey, now the first commercial river in the empire, is more incommoded by banks than the Thames; and is in all respects inferior, as a channel of navigation, to the latter. Still, however, it gives to Liverpool very great advantages; and the channels being well buoyed and marked, the largest ships have little difficulty in reaching the port. The principal channels are laid down in the map of Liverpool and its environs attached to the article Docks in this work.

Bristol and Hull are both river ports. Owing to the extraordinary rise of the tide in the Bristol Channel, the former is accessible to the largest ships. The Humber is a good deal impeded by banks; but it also is navigable as far as Hull, by large vessels. The Tyne admits vessels of very considerable burden as far as Newcastle. Sunderland, at the mouth of the Weir, is the principal ship-building port in the U. K., and has, after Liverpool and London, the greatest amount of shipping.

The shallowness of the Clyde from Greenock up to Glasgow has been a serious drawback upon the commercial progress of the latter. Large sums have been expended in attempts to contract the course and to deepen the bed of the river; and they have been so far successful, that ships drawing 19 and even 20 feet have come up to the city at high water. In 1852, 47 vessels drawing 17 feet water, and 18 drawing 18 feet, arrived at Glasgow, which is now one of the principal commercial ports in the empire.

Generally speaking, the harbours on the east coasts, both of Great Britain and Ireland, are, with the exception of the Thames, very inferior to those on their south and west coasts. Several harbours on the shores of Sussex, Kent, Lincoln, &c., that once admitted pretty large ships, are now completely choked up by sand. Large sums have been expended upon the ports of Yarmouth, Boston, Sunderland, Leith, Dundee, Aberdeen, &c. Dublin harbour being naturally bad, and obstructed by a bar, a new harbour has been formed, at a great expense, at Kingstown, without the bar, in deep water.

For an account of the shipping belonging to the different ports of Great Britain and Ireland, the reader is referred to the article SHIPS in this work. The charges on account of Docks, Pilotage, &c. are specified under these articles.

Foreign Harbours and Ports. — The reader will find the principal foreign commercial harbours described in this work at considerable length under their respective titles. The principal French ports for the accommodation of men-of-war are Brest, Toulon, and Cherbourg. The latter has been very greatly improved by the construction of a gigantic breakwater, and the excavation of immense basins. Besides Cadiz, the principal ports for the Spanish navy are Ferrol and Carthagena. Cronstadt is the principal rendezvous of the Russian navy; Landscrona, of that of Sweden; and the Helder, of that of Holland.

Law of England as to Harbours. — The anchorage, &c. of ships was regulated by several statutes. But most of these regulations have been repealed, modified, or re-enacted, by the 54 Geo. 3. c. 149.

This act authorises the Admiralty to provide for the moorings of his Majesty's ships; and prohibits any private ship from fastening thereto. It further authorises the Admiralty to prohibit the *breaming* of any ship or vessel at any place or places on shore they may think fit; and to point out the places where private ships shall deposit the gunpowder they may have on board exceeding 5 lbs. — (§ 6.) It prohibits the use of any fire on board any ship or vessel that is being breamed in any port, harbour, or haven, between the hours of 11 in the evening and 5 in the morning, from the 1st of October to the 31st of March inclusive; and between the hours of 11 in the evening and 4 in the morning from the 1st of April to the 30th of September inclusive: and it prohibits the melting or boiling of any pitch, tar, tallow, &c. within 250 yards of any of his Majesty's ships, or of his Majesty's dock-yards. By another section, the keeping of guns shotted, and the firing of the same in any port, is prohibited under a penalty of 5*s.* for every gun kept shotted, and 10*s.* for every gun discharged. — (§ 9.) The sweeping or creeping for anchors, &c. within the distance of 150 yards of any of his Majesty's ships of war, or of his Majesty's moorings, is prohibited under a penalty of 10*l.* for every offence. — (§ 10.) The loading and unloading of ballast is also regulated by this statute; but for the provisions with respect to it, see BALLAST.

HARDWARE (Ger. *Kurze waaren*; Du. *Yzerhramery*; Da. *Isenkramvarer*; Sw. *Järnkram*; Fr. *Clinquaillerie, Quincaillerie*; It. *Chincaglio*; Sp. *Quinquilleria*; Port. *Quincalharia*; Rus. *Mjélotzchnue towarii*) includes every kind of goods manufactured from metals, comprising iron, brass, steel, and copper articles of all descriptions. Birmingham and Sheffield are the principal seats of the British hardware manufactures; and from these, immense quantities of knives, razors, scissars, gilt and plated ware, fire-arms, &c. are supplied, as well for exportation to most parts of the world, as for home consumption.

The hardware manufacture is one of the most important carried on in Great Britain; and from the abundance of iron, tin, and copper ores in this country, and our inexhaustible coal mines, it is one which seems to be established on a very secure foundation. The late Mr. Stevenson, in his elaborate and excellent article on the statistics of England, in the *Edinburgh Encyclopædia*, published in 1815, estimated the value of all the articles made of iron at 10,000,000*l.*, and the persons employed in the trade at 200,000. Mr. Stevenson estimated the value of all the articles made of brass and copper at 3,000,000*l.*, and the persons employed at 50,000: and he further estimated the value of steel, plated, and hardware articles, including toys, at 4,000,000*l.*, and the persons employed at 70,000. So that, assuming these estimates to be nearly correct, the total value of the goods produced from different sorts of metals in England and Wales, in 1815, must have amounted to the sum of 17,000,000*l.*, and the persons employed to 320,000.

There is reason to believe that this estimate, in so far, at least, as respects the value of

the manufacture, was at the time decidedly too high; but at this moment it is most probably within the mark. There has been a very extraordinary augmentation of the quantity of bar and pig iron produced within the last 15 years; and the rapid increase of Birmingham and Sheffield, as well as of the smaller seats of the hardware manufacture, shows that it has been increased in a corresponding proportion. We have been assured, by those well acquainted with most departments of the trade, that if to the iron and other hardware manufactures of England be added those of Scotland, their total aggregate value cannot now be reckoned at less than 20,000,000*l.* a year, affording *direct* employment, in the various departments of the trade, for at least 320,000 persons.

Fall of Prices.—Owing partly to the reduced cost of iron, but incomparably more to improvements in manufacturing, a very extraordinary fall has taken place in the price of most hardware articles during the last 12 or 15 years. In some articles the fall exceeds 80 per cent.; and there are but few in which it does not exceed 30 per cent. In consequence, the poorest individuals are now able to supply themselves with an infinite variety of commodious and useful articles, which, half a century ago, were either wholly unknown, or were too dear to be purchased by any but the richer classes. And those who reflect on the importance of the prevalence of habits of cleanliness and neatness will readily agree with us in thinking that the substitution of the convenient and beautiful hardware and earthenware household articles, that are now every where to be met with, for the wooden and horn articles used by our ancestors, has been in no ordinary degree advantageous. But it is not in this respect only that the cheapness and improvement of hardware is essential. Many of the most powerful and indispensable tools and instruments used by the labourer come under this description; and every one is aware how important it is that they should be at once cheap and efficient.

Account of the Real Values of the Various Descriptions of Iron, of the Brass and Copper Manufactures, Hardware and Cutlery, &c., exported from the U. Kingdom during each of the 7 Years ending with 1858.

	1852.	1853.	1854.	1855.	1856.	1857.	1858.

HARPOONER, the man that throws the harpoon in fishing for whales. By 35 Geo. 3. c. 92. § 34., no harpooner, line manager, or boat steerer, belonging to any ship or vessel fitted out for the Greenland or Southern whale fisheries, shall be impressed from the said service; but shall be privileged from being impressed so long as he shall belong to, and be employed on board, any ship or vessel whatever in the fisheries aforesaid.

HATS (Ger. *Hüte;* Du. *Hoeden;* Fr. *Chapeaux;* It. *Cappelli;* Sp. *Sombreros;* Rus. *Schlopü*), coverings for the head in very general use in Great Britain and many other countries, and known to every body. They are made of very various forms and sorts of material. They may, however, be divided into two great classes, viz. those felted or made of fur, wool, silk, &c., and those made of straw; the former being principally worn by men, and the latter by women.

I. Hats (Felted, Fur, Silk, &c). We possess little information as to the importance of hats, as a distinct branch of manufacture, anterior to the reign of Elizabeth.

Felted hats are stated to have been worn by the Saxons, but the earliest notice we find of "*beaver*" hats, is in an inventory of the effects of Sir John Falstoffe in 1459. Philip Stubbs, in his "Anatomie of Abuses," published in 1585, mentions amongst *other varieties*, "bever hats of 20, 30, and 40 shillings price being fetched from beyond the seas." In subsequent reigns, and particularly during the Commonwealth, the manufacture of both beaver and felted hats must have arrived at some importance; and not only the quality, but the shape of the hat, began to possess an influence in denoting the religious or political bias of the wearer, a characteristic of this article of dress, which obtains even at the present day. An interesting account of hats as worn at different periods of our history is given in the Archæologia, and the details of the manufacture,

as it is now carried on, are given in a work called "Days in the Factories" (by Mr. George Dodd), published in 1843.

Charles VII. of France wore a hat on his public entry into Rouen in 1449, which is believed to have been among the first manufactured in his kingdom.—(*Encyclopédie*, art. *Chapeaux.*)

The following details with respect to the species of hats manufactured, their value &c., furnished by a high practical authority, present a view of the trade as it existed in 1843.

1. *Stuff Hats.*— This term is applied by the trade only to the best description of hats, or to those brought to the highest perfection in London. Since the introduction of "waterproofing," it is found unnecessary to use so valuable a material as beaver in the foundation or frame-work of the best hats. Instead of it, fine seasoned backs of English coney wool, red Vigonia wool, Dutch carroted coney wool, and a small quantity of fine Saxony lambs' wool, are employed with equal advantage.

The covering, *i. e.* the "napping," of the best qualities is a mixture of *check* beaver, with white and brown stage beaver, or seasoned beaver, commonly called "*wooms.*" Inferior stuffs are napped with mixtures of stage beaver, nutria, hares' wool, and musquash.

Of late years, hats have been much reduced in weight. This is principally owing to the new method of "waterproofing," which is effected in the bodies of the hats prior to their being napped. The elastic properties of the gums employed for this purpose, when dissolved in pure spirits of wine, give a body to the stuffs which allows a good deal of their weight to be dispensed with.

Not 20 years ago, 96 ounces of stuff were worked up into 1 dozen ordinary sized hats for gentlemen; at present, from 33 to 34 ounces only are required to complete the same quantity. It is proper to observe that the heavy duty on English spirits of wine is very injurious to the manufacture, as it causes the employment of inferior dissolvents, as naphtha and gas spirit, which injure the gums.

The manufacture of the best hats employs in London nearly 1,000 makers and finishers, besides giving employment to nearly 3,000 men in Gloucestershire and Derbyshire, in body-making and ruffing. The gross returns amount to about 640,000*l.*

2. *Plated Hats.*—Next to fine hats are those designated "plated," so called from the *plate*, or napping, being of a distinct and superior nature to the foundation or body. The latter is generally formed of Kent, Spanish, or Shropshire wool; while the former consists of a mixture of fine beaver, hares' wool, musquash, nutria, and English back wool. From the cheapness of coal and the purity of the water in Lancashire, Cheshire, and Staffordshire, the whole of the plating trade is engrossed by them. The men employed in the 3 counties, including apprentices, do not exceed 3,000. The total returns amount to about 1,080,000*l.*, inclusive of bonnets and children's fancy beaver hats.

3. *Felt Hats* and *Cordies* are the coarsest species, being made wholly of Kent, Shropshire, and Italian wools. Cordies are distinguished by a fine covering of camel or goat hair. A very large trade was at one time carried on in these articles but since the introduction of caps, and the manufacture of inferior plates, the returns have sunk fro m 1,000,000*l.* to scarcely 150,000*l.*! Atherstone, Rudgeley, Bristol, and Newcastle-under-Line are the principal places where they are manufactured.

4. *Silk Hats*, made from silk, plush, or shag, manufactured in Coventry, Banbury, and Spitalfields, form at present, a very important branch of the hat trade. Many thousand dozen are exported to Italy, Gibraltar, the Cape, Sydney, and Van Diemen's Land. Little progress was made in this article for the first quarter of a century after its invention, in consequence of the hard appearance which the cane and willow framework necessarily gave the hats; but now that beaver hat bodies have been used, as well as those of lawn and muslin, this difficulty has been overcome, and silk hats have as soft an outline and as great a variety of shapes as beaver hats. London alone produces nearly 150,000 dozen silk hats annually; and the quantity manufactured in Manchester, Liverpool, Birmingham, and Glasgow is estimated at upwards of 100,000 dozen more, making a total of above 250,000 dozen. The workmen are distinct from beaver hatters; and owing to the competition of labourers, the trade has advanced in a greater ratio. This branch gives employment to about 3,000 men.

At present (1843) *silk hats* of a low quality are more extensively worn; and public taste has set strongly in favour of a new and showy kind of silk hat, made on the French plan, and of a material imported from France at a duty of 30 per cent. This change, which has reduced the consumption of both *stuff* and *plated* hats, probably arose, so far as regards the lower sorts of silk hats, from motives of economy, induced by the recent state of the country, and in the higher qualities, chiefly from the influence of fashion. But though there be no reason to conclude that this change will be permanent, it has at present depressed the trade, especially in the finer branches.

Machinery is extensively used in the preparation of the materials for the manufacture, but has hitherto been found inapplicable to the manufacture itself, which, in some processes, requires a certain amount of mental discretion. Particular districts are celebrated for particular branches of the trade, chiefly from special reasons respecting fuel, water, or lowness of wages; but the increased competition has of late had a tendency to concentrate the trade in a few localities rather than to disperse it, although it is still rather widely distributed. Hitherto the trade has not been exposed to foreign competition in the home market, but it has been of late years seriously affected in the Brazilian and West Indian markets.

Few beaver or ruffed hats meet the English manufacturer in the markets referred to; but chiefly hats of silk or felted hares' wool, of styles not adapted to our taste, though suited to that of Europe and South America.

English hats, though to a limited extent, and in an unfinished state, have been exported to the Continent. The hats chiefly exported to our colonies are silk, plated, and stuff hats, generally of a light description. Wool felts, which before the Emancipation Act were largely exported, have now materially decreased, the article termed "negro felts" being almost extinct.

This trade employs a great amount of labour, being supposed to furnish, at present, employment to not less than 30,000 persons. In the Lancashire district, the first and second manufacturing processes are chiefly carried on in the houses of the workmen. The labour of women and children is very largely employed in the trade generally, but less in the actual manufacture than in the preparation of the material; the proportions may be, in both departments, men 50 per cent., women 25 per cent., and children 25 per cent.; and their earnings, on a yearly average, are, men 25*s.*, women 7*s.*, and boys 5*s.* per week. The depression in the finer branches of the manufacture has doubtless affected the earnings of the workmen engaged in them, as a less amount of skill and labour is required in the production of low silk hats than beavers, and the increased quantity produced in the lower descriptions has not furnished an amount of employment equivalent to the decrease in the higher branch. Combinations on the part of the workmen have occasionally arisen, sometimes from questions affecting wages and disputes arising out of the existence of trades' unions, but not to any considerable extent, from attempts to introduce machinery.

No data exist on which to form any certain estimate of the value of the different branches of the manufacture or of its aggregate amount. But it is estimated, on good grounds, that on *plated* goods, the cost of the raw material varies from 25 to 40 per cent, the labour and manufacturing expenses from 75 to 60 per cent.; on stuff hats, materials 40 to 50 per cent., labour, &c. 60 to 50 per cent.; silk hats, materials 50 per cent., labour, &c., 50 per cent. The proportions in value are estimated as follows, viz.

Plated hats, 1,200,000*l.*; stuff do., 800,000*l.*; silk do., 900,000*l.*; wool felts, 100,000*l.*; making in all, 3,000,000*l.*

The duty on hats, which was formerly 10*s.* 6*d.* each, was reduced in 1842 to 2*s.* 6*d.* on fur and wool hats, and to 3*s.* 6*d.* on silk. In 1836, 53,894 dozen hats were exported, of the real or declared value of 148,282*l.*; but in 1841, the exports only amounted to 22,522 dozen, of the value of 81,583*l.* The falling off has been principally in the exports to the West Indies and Brazil.

Hat Manufacture in 1859. — A very extraordinary change has taken place in the state of the hat trade since 1843. This will be evident from the following details, which have been supplied to us by the highest practical authorities.

Stuff Hats. — This branch of the hatting trade has all but wholly ceased, in consequence of the preference given to *silk hats* (which are universally worn), owing to their lower price, and equal if not superior appearance. The only demand for *stuff hats* at the present time is for drab beavers for summer wear, the production of which may probably employ about 200 men throughout the country, during a portion of the year.

Silk Hats. — At present (1859), it is believed by persons well acquainted with the trade, that about 1,200 men are employed in London, and about 1,500 in other parts of the country, making about 500,000 dozens, of the value of 2,000,000*l.*

Plated Hats and Cordies. — This branch of the trade may be said to be extinct, and the men formerly employed in it and the silk hat branch, have found employment in the making of soft felt hats.

Felt Hats. — A great demand has sprung up for this article within the last 12 or 14 years in Lancashire, Gloucestershire, Derbyshire, and Staffordshire, giving employment to about 5,000 men and 1,000 female trimmers. The quantity annually made is estimated to amount to about 500,000 dozens, of the value of 700,000*l.* or 800,000*l.*

It is seen above that in 1843 the yearly value of the hat manufacture was estimated at about 3,000,000*l.* employing in its different departments about 30,000 persons throughout the U. Kingdom. And though the most expensive description of hats has been superseded, the trade has been much extended; the reduction which has taken place in prices, has led to a great increase in the quantities consumed and exported. The exports which, in 1857, amounted to 149,946 doz., worth 292,198*l.*, are chiefly to our colonies in Australia, British North America, the West Indies, and to N. and S. America. Labour, profit, and interest on capital form perhaps three-fourths of the yearly returns. Machinery is used to a very small extent, the manufacture being almost entirely conducted by manual labour. Wages vary from 8*s.* to 16*s.* weekly for women, and from 25*s.* to 30*s.* for men.

II. Hats (Straw).—It is most probable that the idea of *plaiting straws* was first suggested by the making of baskets of osiers and willow, alluded to by Virgil, in his Pastorals, as one of the pursuits of the agricultural population of Italy. We are ignorant of the period when the manufacture of straw plait first became of importance in that country; but it appears from Coryat's *Crudities*, published in 1611, that "the most delicate strawen hats" were worn by both men and women in many places of Piedmont, "many of them having at least an hundred seames." It is evident, therefore, that the art of straw plaiting must have arrived at great perfection upwards of two centuries since; but it does not appear to have been followed in England for more than 70 or 80 years, as it is within the remembrance of some of the old inhabitants of the straw districts, now alive, that the wives and daughters of the farmers used to plait straw for making their own bonnets, before straw plaiting became established as a manufacture. In fact, the custom, among the women of England, of wearing bonnets, is comparatively modern: it is scarcely 100 years since "*hoods and pinners*" were generally worn, and it was only the ladies of quality who wore small hats.—(*Malcolm's Manners and Customs.*)

In the edition of this work published in 1844, we stated that, during the ten years ending with 1843, the manufacture of British straw hats and bonnets had increased perhaps $\frac{2}{3}$, and of straw plait about $\frac{1}{3}$, compared with the former decennial period. At the present time (1859) it is confidently affirmed by persons conversant with the trade, that it has increased not less than threefold. It was estimated in 1843 that every score (20 yards) of plait consumed a pound of straw; that every plaiter made 15 yards per diem; that in Hertford, Bedford, and Bucks, the principal seats of the trade, there were at an average 10,000 scores brought to market every day, to make which, 13,300 women and children were employed. In Essex and Suffolk the daily produce was estimated at 2,000 scores, to make which, 3,000 persons were employed, and about 4,000 persons more must have been employed in converting those quantities into bonnets. Including other places where the manufacture was carried on in England, it was supposed there were in all, in 1833, about 30,000 persons engaged in it, while in 1843, there could not be less than from 40,000 to 50,000 persons, including 1,500 sewers in London. At this time (1859), such has been the improvement as well as the increase of the manufacture, that the average production of each straw-plaiter is estimated at 20 yards per diem from the same weight of straw, in Hertfordshire, Bedfordshire, and Bucks, and that the plaiting produced must exceed 25,000 scores, giving employment to an equal number of women and children. During some periods of the year, when out-door work is scarce, men and boys are now found amongst the producers. In Essex and Suffolk the produce has been more stationary; perhaps 3,000 persons are employed, producing about 2,500 to 2,700 scores daily. The *range* of the earnings of plaiters continues about the same (from 3*d.* to 3*s* 6*d.* per score, or from 1*s.* 6*d.* to 10*s.* per week), but the *average* is higher than in the former period, children earning 2*s.*, and grown persons 5*s.* The sewers in country districts earn from 6*s.* to 15*s.*, and average about 10*s.*, while the same class in London receive

from 6*s.* to 40*s.* and average about 11*s.* or 12*s.* Taking into account the various new kinds of plaiting and trimmings introduced from Switzerland, it is computed that the number employed in making straw and fancy hats and bonnets, must amount to 160,000 or 180,000, including the London sewers. The annual value of the trade in all its branches may be roughly estimated at between three and four millions sterling, the greater portion of which is formed of the wages of labour.

The improvement and extension of the trade are ascribed to various causes. During the last few years the practice has arisen of *blueing* instead of *bleaching* the straw, and this has been attended with the most beneficial results. Formerly much anxiety was occasioned lest the straw used for plaiting should become discoloured, and be otherwise affected by the weather before harvest, but this anxiety is now wholly removed, by the process of dyeing, while the plaiters have secured more constant employment. *Brown* was at first introduced, and subsequently *grey*, both of which are now in demand to a great extent both by men and women. Down to 1852, the production of men's and boys' hats made of *Brazilian grass*, was an improving branch of the trade, but it has since sensibly declined, owing to the preference shown for straw hats. Indeed, so fashionable and common have straw hats become, particularly since dyed straw has been introduced, that they have interfered greatly with the silk hat trade, besides superseding the Brazilian grass hats. During 1858, so rapidly did the fashion spread amongst the male portion of the population (except in London), that it was described as almost universal. Another most important cause of improvement in the trade is the reduction which has taken place in the duty on importation of foreign hats and plait. Instead of 5*s.* 8*d.* per hat, and 8*s.* 6*d.* per lb. for plait, the duty is now 2*s.* 6*d.* per lb. on hats, and 2*s.* per lb. on plait, and a great impetus has, in consequence, been given to the trade both in plaiting and hats, boys' and children's hats being now admitted, which formerly, owing to the high duty, were virtually prohibited. The importation of hats from Leghorn has, however, almost ceased. Tuscan plait has become so reduced in price, that it is no longer necessary to import the straw used for making the plait. Indeed, notwithstanding the diminution in price, Tuscan plait itself is no longer prized as it was a few years since, and the consumption has much declined, compared with former years.

Since our last account of this trade was written, the varieties of patterns in straw-plaiting have considerably increased, which with the use of horse hair (plaited by machinery), woven into light fancy trimmings, gives a distinctive feature to the trade compared with any previous epoch. The use of horse hair braid has never been superseded since its introduction, about 16 years ago; it has rather gradually increased. In 1858, cotton braid (in imitation of crinoline and chip plaiting), has been very extensively used by itself, and in combination with straw plait, adding another new feature to the trade. Other woven trimmings of Swiss manufacture have also been introduced in imitation of pillow lace or blond, worked with horse hair, and afterwards embroidered with straw, beads, &c.

Straw plaiting still continues a cottage employment, with the exception of two or three industrial institutions and unions scarcely worth mentioning. Bonnet and hat making is almost equally divided between factory and domestic employment. If small work-rooms are included in the term "factory," perhaps nine-tenths of the whole would come within that class.

Luton continues to be the chief seat of the manufacture. There is a tradition that the unfortunate Mary, queen of Scotland, when travelling through the duchy of Lorraine, invited some of the straw-plaiters there, to introduce the art into Scotland. It was not, however, very successful; and it is said that shortly after the accession of James VI. to the throne of England, he encouraged them to remove to Luton, where the trade has since maintained itself. At this time there are nearly 100 dealers connected with the manufacture in its different branches established in that town. Straw-plaiting in Orkney has entirely ceased.

Italian Manufacture. — Although from the causes above-mentioned, the importation into England of Tuscan straw plait and hats has materially diminished, new markets have been opened both in France and America, which have amply compensated for the falling off in the demand for England. The Tuscans, on the reduction of the English duty in 1856-7 to 5*s.* per lb., began making fancy plait, in which they speedily excelled; and also the fabrication of trimmings by the loom, in imitation of those made in Switzerland; but in this latter branch they were not so successful. About this time, however, the old fashioned Leghorn "flat" (called *Fioratti*), which from its circular form was difficult to convert into fancy shapes, was replaced by an entirely new conical shape, vulgarly called *Poke* or *Capotte*, which was better adapted for being cut into bonnets, and being only made of the finest qualities of plait, gave good employment for some years to the most skilful workers, whose average earnings amounted to about 9*d.* or 10*d.* English, per day. These sugar-loaf or "Poke" Leghorns have been nearly all bought by Paris houses (the English manufacturers deferring to the Parisians in the question of taste) through whom the whole world, it is said, has been supplied with ready-made bonnets; but owing to their high price (about 1*l.* each) the consumption has been limited, and has been superseded by the so-called Tuscan bonnets sewn in this country. During that period large quantities of Tuscan straw for plaiting were imported into England, amounting to from 200,000 to 400,000 lbs. per annum, at prices varying from 1*s.* 3*d.* to 2*s.* 6*d.* per lb., affording an ample supply to the plaiters; and so successful was this competition, that in the course of 2 or 3 years a case of *foreign* Tuscan plait could scarcely be imported at all to advantage, even at the reduced duty. A slight revival in the taste for Tuscan bonnets took place about 1851, when the duty was further reduced to 2*s.* per lb.; but a great reduction has occurred in prices. The piece of 55 to 57 yards was sold from 1830 to 1841, at from 10*s.* to 15*s.*; from 1842 to 1848, at 4*s.* to 6*s.*; and at the present time, 1859, the depression is so great, that the average price of the piece, duty paid, is not more than 3*s.* 6*d.* In an able pamphlet on the straw trade of Tuscany, by Signor Mariotti, published at Florence in 1858,* there is much interesting information on that subject. He supplies the following returns, extracted from the Tuscan customs books —

An Account, in Sterling, of the Value of the Straw Hats, Plait, and Straw for Plait, exported from Tuscany in each of the 5 Years ending with 1855.

Years.	Straw Hats.	Plaiting.	Fancy Straws.	Total.
	£	£	£	£
1851	150,000	125,000	25,000	300,000
1852	217,000	135,000	12,000	364,000
1853	260,000	175,000	19,000	454,000
1854	190,000	180,000	28,000	398,000
1855	325,000	235,000	5,500	565,500
	1,142,000	850,000	89,500	2,081,500

* "Notizie Storiche Economiche e Statistiche intorno all' arte della Paglia in Toscana. Raccolti da Phillippo Mariotti."

These results show that the straw trade of Tuscany would not average less than about 400,000*l.* per annum, and may well be considered as the main source of that country's riches, for it would appear that no other produce (silk included) reaches to more than about 100,000*l.* per annum. There has also been a considerable trade carried on principally with America and Continental Europe, in men's common Leghorn hats, at prices so low as from 2*d.* to 8*d.* each, called *Mountain Hats*, which are principally made on the confines of Tuscany, and in the Roman States (towards Bologna), averaging about 60,000*l.* yearly during the same period of 5 years. No material change has since taken place in the production; and of the whole it is estimated that from 40,000*l.* to 60,000*l.* per annum is taken by England. During the same period the exportation of straw is stated to be—in 1851, 104,000 lbs. English; in 1852, 251,000 lbs.; in 1853, 150,000 lbs.; in 1854, 72,000 lbs., and in 1855, 22,000 lbs. These returns show the gradual decrease of the consumption of Tuscan straw in England, and for the last few years its importation has wholly ceased. It is computed that about 100,000 hands are engaged in Tuscany in this interesting branch of industry, and that perhaps 1-3rd of that number are men. Wages at present (1859) are as low as at any previous period. Men regularly engaged in the dressing of the hats earn from 1*s.* 3*d.* to 1*s.* 9*d.* English. Workwomen from 6*d.* to 10*d.*, and all who work independently, at their own homes, are considered to be earning from 3*d.* to 7*d.* per day.

It is stated in Signor Mariotti's pamphlet, that as far back as 1341, the art of straw plaiting was known in Tuscany; certain kinds of foreign straws were then also imported; for in 1737 there was a duty levied upon it, which, however, was repealed by Leopold I. It is shown by a tomb-stone existing in the church of St. Miniato, at Signa, that Domenico Michelacci, a native of Bologna; carrying on business there in the commencement of the 18th century, was the first to establish with England the export trade in Leghorn hats. In 1718 this same man raised the first fine straw used in Tuscany. In 1757, and the following year, an annual export business in hats commenced, and reached from 15,000*l.* to 25,000*l.* sterling. The first hats for ladies (afterwards so largely imported into England), were made only in 1813, of the number of 40 rows. In 1818 the hands employed were estimated at from 50,000 to 60,000, earning from 1*s.* to 1*s.* 9*d.* per day. In 1822 the exportation to America began, and although an increase of hands was the result, the earnings rose from 1*s.* 4*d.* to 5*s.* per day. In 1826-7, the trade in ladies' Leghorn hats reached its climax; and soon after that the Tuscan plait in 11 straws, was introduced.

Swiss and other Manufactures.—The *Swiss* straw trade has greatly developed itself during the last 15 or 20 years; the returns in some of the most favourable seasons cannot have been less than from 200,000*l.* to 300,000*l.* England takes about 1-3rd, and America a large quantity. Wohlen (in the Canton d'Argovie) is the central seat for *loom* and all kind of fancy trimmings; but within the last 10 years white horse-hair braid (of which the largest manufactory is at Kriens, near Lucerne), has been in great demand. In the Fribourg Canton, there is also an interesting straw trade carried on, the principal districts being *Bulle* and *Chatel St. Denis*; but being a similar kind of straw to the Belgian and English, the importations into this country are but trifling, although a large amount of business is done with Paris and America.

Chip hats and plaiting are also produced at Modena, or rather Carpi, in its vicinity. Though commonly called "*paille de riz*," it is simply the wood of the willow cut into strips for the purpose of being plaited, and is of a most beautiful white. These "chip flats" are chiefly sent to Paris, where they are dressed in a peculiar manner, and shipped to all parts of the world. Some are shipped to England in their natural state, to be stripped and sown into white bonnets, and some, also, are dyed black and other colours. The art, it is said, was first introduced by Signor Corston, in 1803, and has been of great advantage to the small locality where it is carried on; but the returns, it is believed, cannot exceed from 15,000*l.* to 30,000*l.* per annum. The duty is the same as on straw plaiting, viz. 2*s.* per lb.

Panama hats have also been imported into England. They are made of a species of bleached grass grown in Central America, nearly quite white, of great tenacity, and very serviceable. They make a capital summer wear for men and boys. Those imported have, however, been mostly re-exported for Australia and the Continent. We subjoin—

An Account of the Weight and Value of the Straw Hats and Plaiting imported in 1857, specifying the Countries whence they came, and the Quantities and Values of those brought from each.

We are indebted for this learned and excellent article on Straw Hats to our friend Mr. Robert Slater, of Fore Street, London.

HAVANNAH, or HAVANA, on the north coast of the noble island of Cuba, of which it is the capital, the Morro castle being, according to Humboldt, in lat. 23° 8′ 15″ N., lon. 82° 22′ 45″ W. The population of the city and suburbs is said to be, at present (1859), little short of 200,000. In 1827, the resident population amounted to

94,023; viz. 46,621 whites, 8,215 free coloured, 15,347 free blacks, 1,010 coloured slaves, and 22,830 black slaves. The port of Havannah is the finest in the West Indies, or, perhaps, in the world. The entrance is narrow, but the water is deep, without bar or obstruction of any sort, and within it expands into a magnificent bay, capable of accommodating 1,000 large ships; vessels of the greatest draught of water coming close to the quays. The city lies along the entrance to, and on the west side of, the bay. The suburb Regla is on the opposite side. The Morro and Punta castles, the former on the east, and the latter on the west side of the entrance of the harbour, are strongly fortified, as is the entire city; the citadel is also a place of great strength; and fortifications have been erected on such of the neighbouring heights as command the city or port. The arsenal and dock-yard lie toward the western angle of the bay, to the south of the city. In the city the streets are narrow, inconvenient, and filthy; but in the suburbs, now as extensive as the city, they are wider and better laid out. Latterly, too, the police and cleanliness of all parts of the town have been materially improved.

From its position, which commands both inlets to the Gulph of Mexico, its great strength, and excellent harbour, Havannah is, in a political point of view, by far the most important maritime station in the West Indies. As a commercial city it also ranks in the first class; being, in this respect, second to none in the New World, New York only excepted. For a lengthened period, Havannah engrossed almost the whole foreign trade of Cuba; but since the relaxation of the old colonial system, various ports, such, for instance, as Matanzas, that were hardly known 40 years ago, have become places of great commercial importance. The rapid extension of the commerce of Havannah is, therefore, entirely to be ascribed to the freedom it now enjoys, and to the great increase of wealth and population in the city, and generally throughout the island.

The advance of Cuba, during the last half century, has been very great; though not more, perhaps, than might have been expected, from its natural advantages, at least since its ports were freely opened to foreigners, in 1809. It is at once the largest and the best situated of the West India islands. It is about 605 miles in length; but its breadth from north to south nowhere exceeds 117 miles, and is in many places much less. Its total area, exclusive of that of the numerous keys and islands attached to it, is about 33,000 square miles. The climate is, generally speaking, delightful; the refreshing sea breezes preventing the heat from becoming excessive, and fitting it for the growth of a vast variety of products. Hurricanes, which are so destructive in Jamaica and the Caribbee Islands, are here comparatively rare; and, when they do occur, far less violent. The soil is of very various qualities: there is a considerable extent of swampy marshes and rocks unfit for any sort of cultivation; but there is much soil that is very superior, and capable of affording the most luxuriant crops of sugar, coffee, maize, &c. The ancient policy of restricting trade to 2 or 3 ports, caused all the population to congregate in their vicinity, neglecting the rest of the island, and allowing some of the finest land and best situations for planting to remain unoccupied. But since a different and more liberal policy has been followed, population has begun to extend itself over all the most fertile districts, wherever they are to be met with. Still, however, only a very small proportion of the best land of the island is under cultivation, and its products and population might be doubled or trebled with the utmost facility. The first regular census of Cuba was taken in 1775, when the whole resident population amounted to 169,370 souls. Since this period the increase has been as follows:—

Years.	Whites.	Free coloured.	Slaves.	Total.
1775	94,419	30,615	44,336	169,370
1827	311,051	106,494	286,942	704,487
1841	418,291	152,838	436,495	1,007,624
1853	510,988	176,647	330,425	1,009,060
1857	549,674	174,810	374,549	1,107,491

To the above has to be added, 5,240 for *emancipados*, and 5,308 for Asiatic colonists. But it is alleged that both the slave and white inhabitants are underrated in this census, and that the population is, at present (1859), little, if at all, short of 1,450,000 or 1,500,000.

The rapid increase of the slave population down to 1841, is principally to be ascribed to the continued importation of slaves from Africa. In some years, after the peace of 1815, as many as 40,000 blacks are believed to have been imported into Cuba in a single year. Spain had indeed agreed by treaty in 1820 to abolish the trade; but this agreement was little better than a dead letter, and it is only since 1835, when a more efficient treaty with Spain was entered into, that the trade has sustained any considerable diminution. But though it be no longer continued under the Spanish flag, it is continued, though to a much less extent, under other flags. Recently not more than from 2,000

to 3,000 negroes are supposed to be annually imported. But it is doubtful what effect the objections made by the Americans to the right of visitation and search may have on the trade. If the mere hoisting of the American flag is to protect vessels from inquiry or molestation of any sort, an impunity will be provided for piracy, as well as the conveyance of slaves.

But though it were to be wished, as well for the interests of the island as of humanity, that the farther importation of slaves should be put a stop to, we are not of the number of those who think that it would be good policy rashly to agitate the question of the emancipation of slaves in Cuba. Their treatment in that island, as in all the other colonies of Spain, has always been singularly humane; and the results of their emancipation in Hayti and the British islands have not been such as to offer much inducement to the authorities in Cuba to take up this difficult question. It may, no doubt, be forced on their consideration: and the emancipation of so many slaves in their immediate vicinity will materially increase the difficulty of maintaining the existing order of things. Under these circumstances, good policy would seem to suggest that timely provision should be made for the gradual bringing about of that emancipation which is, perhaps, inevitable, coupling it, if that be practicable, with some scheme for insuring the supply of some sort of compulsory labour.

Whatever opinion may be formed of slavery in the abstract, we believe it would not be difficult to show that it has contributed, in no ordinary degree, to the rapid advancement of Cuba. Industry will always be proportioned to the strength of the motives by which it is occasioned; and in countries like Cuba, of great natural fertility and under a tropical sun, where a half or more of the articles indispensable in Europe would be useless, it were absurd to imagine that the inhabitants, supposing them to be free, should exhibit the persevering industry of free labourers in the temperate zone. The *dolce far niente* is in such countries the *summum bonum*; and we believe it will be found that the extensive cultivation of sugar, and of most other commercial products within the tropics, depends on the maintenance of slavery, or of compulsory labour of one kind or other. The people of England may be but little affected, at least directly, by these considerations, and may, therefore, on the principle of *fiat justitia, ruat cœlum*, think themselves warranted in using their influence to enforce the abolition of slavery wherever it exists. But to the Cubans, Brazilians, the inhabitants of the Southern States of America, and a host of others, this question is of the last importance. Were the slaves emancipated, not in law merely, but practically and in fact, the probability is that neither Cuba nor Brazil would, in a dozen years, export a single cwt. of sugar. Why should they do so any more than Hayti? The blacks, were they really emancipated, would be able to support themselves in that state in which they wish to live, without engaging in anything like the severe labour of sugar planting; and under such circumstances it would be a contradiction to suppose they should engage in it. But it might be difficult, perhaps, to show what good consequences would result from such a change. It is at all events clear that the commerce of the world and the comforts of all civilised nations would be seriously impaired; and it is by no means clear that the condition of the blacks would be sensibly, or at all, improved.

Besides slaves, the planters employ free labourers, mostly of an Indian mixed breed, who work for moderate wages. These, however, are little engaged in the fields, but in other branches of labour, and particularly in bringing sugar from the interior to the shipping ports.

The articles principally exported from Cuba are, sugar of the finest quality, coffee, copper ore, tobacco, bees' wax, honey, molasses, &c. Of these, the first is decidedly the most important. The following statements show the astonishing increase that has taken place in the exportation of this staple article.

Account of the Exportation of Sugar from Havannah, from 1786 to 1856.

From 1786—1790	68,150 boxes at 400 lbs.	=	27,260,000 lbs.
1800—1810	177,998	—	71,199,209
1810—1820	207,696	—	83,078,400
1820—1825	250,384	—	100,153,600
In 1830	292,732	—	117,092,800
1840	440,144	—	176,057,600
1845	267 595	—	107,038,000
1850	746,405	—	298,562,000
1855	965,677	—	396.270,800
1856	872,592	—	349,036,800

But the Havannah has long ceased to be, as it formerly was, the only port in the island for the exportation of sugar. The exports from Matanzas now usually amount to about a third part of those from the Havannah; and there is also a considerable export from Trinidad, St. Jago de Cuba, Cienfuegos, and other ports. In 1854 the entire exports from the island were reckoned at 1,685,000 boxes, of which 898,000, or about a half, were shipped from the Havannah. Now if we add to the official export, as we may safely do, 10 per cent. for the quantities exported without entry or payment of duty, the real export may be estimated at 1,853,500 boxes, equal to 781,460,000 lbs., or 353,000 tons. The consumption of

the Island may amount to 25,000 tons, making the total production 378,000 tons. And vast as this quantity is, it might be indefinitely increased, could supplies of labour be easily procured; but it is doubtful, supposing the slave trade were put down, whether it would be maintained at its present level.

Account of the Sugar exported from Cuba in each of the 5 Years ending with 1858.

Years.	Boxes.	Tons.	Hhds.	Tons.	Total Tons.
1854	1,238,959	235,402	180,034	116,722	352,124
1855	1,303,922	247,745	208,732	128,890	376,635
1856	1,114,543	211,763	237,765	146,822	358,585
1857	1,024,541	194,662	253,267	156,398	351,060
1858	1,184,375	225,125	243,739	150,510	375,635

Next to sugar, coffee was the most valuable vegetable production of Cuba. Its cultivation increased, for a while, with unprecedented rapidity. In 1800, there were but 80 plantations in the island; in 1817, there were 779; and in 1827, there were no fewer than 2,067, of at least 40,000 trees each! In 1804, the exportation from Havannah was 1,250,000 lbs.; in 1809, it amounted to 8,000,000 lbs.; from 1815 to 1820, it averaged annually 18,186,200 lbs.; and in 1827 it amounted to 35,837,175 lbs.! The exports from the other ports increased with equal rapidity. They amounted, in 1827, to 14,202,406 lbs.; making the total exportation for that year 50,039,581 lbs. But the subsequent low prices, or rather, perhaps, the greater attention paid to the culture of sugar, not only checked the further increase of the coffee plantations, but made several of them be abandoned. More recently, however, the increase in the price of coffee has occasioned a slight reaction, and the culture of coffee is again extending. The exports of it in 1854 amounted to 12,787,300 lbs., to which 10 per cent. may be added for deficient entries.

Tobacco differs much in quality; but the cigars of Cuba are esteemed the finest in the world.—(See TOBACCO.) Formerly, the culture and sale of this important plant were monopolised by government; but since 1821, this monopoly has been wholly relinquished, there being no longer any restrictions either on the growth or sale of the article. The cultivator pays a duty, which, however, is to a great extent evaded, of 1 per cent. *ad valorem* upon his crop. In consequence of the freedom thus given to the business, the culture and exportation of tobacco are both rapidly extending; so much so, that the value of the produce of tobacco is now (1858) more than four times the value of the coffee produced. Molasses, rum (tafia), wax, and honey, are also largely produced, and form important articles of trade.

In the same year (1855) the total value of the exports amounted to 34,802,826 dolls. In 1854 the value of the imports amounted to 31,394,578. During the same year, duties to the amount of 7,796,652 dolls. were collected from the imports, and 1,947,043 dolls. from the exports. The amount both of imports and exports has since materially increased.

The copper mines near Santiago and in other parts of the island, after having been abandoned for nearly a century, were reopened a few years ago, and are now worked, principally by Englishmen, with great vigour and success. The ore is one of the most valuable products of the island. It is mostly sent to England to be smelted. Of 97,099 tons copper ore imported into this country in 1858, 14,728 tons were from Cuba.

The imports into Cuba consist principally of corn, flour and grain of all sorts, with provisions, principally from the United States, cotton goods from the latter and England; wines from Spain and France; linens from the Hanse towns and England; hardware and metals from England; silks from France and Spain; gold and silver from Mexico; spices, fruits, dye-stuffs, lumber, haberdashery, &c.

Statement of the Foreign Arrivals at the Havannah for the 9 Years ending with 1858, distinguishing the American, Spanish, and English Flags. The rest of the trade is distributed about equally among French, Belgian, Dutch, Danish, Bremen, and Hamburg vessels:—

The coastwise arrivals during 1857 were 3,640.

The admission of slave-grown sugar to our markets has considerably promoted our trade with Cuba. The U. States, however, engross the largest share of the trade of the island, a consequence in part of their proximity, but more of their supplying her with large quantities of flour, provisions, lumber, &c., and of their being principally indebted to her for their imports of sugar. The value of the exports from the U. States to Cuba in 1857-58 amounted to 17,673,167 doll., and that of the imports to 27,214,846 doll.

Slaves, though an important article of import, are not noticed in the above tables. We have already made some remarks on the numbers supposed to be annually introduced into the island.

Monies.— One dollar = 8 reals plate = 20 reals vellon. One doubloon = 17 dollars. The merchants reckon 441 dollars = 100*l.* or 1 dollar = 4*s.* 6*d.* very nearly. There is an export duty of 1⅛ per cent. on gold, and 2⅛ per cent. on silver. It is a curious fact that no description of paper money has ever circulated in Cuba.

Weights and Measures.— One quintal = 100 lbs., or 4 arrobas of 25 lbs.; 100 lbs. Spanish = 101¼ lbs. English, or 46 kilogrammes. 108 varas = 100 yards; 140 varas = 100 French ells or aunes; 81 varas = 100 Brabant ells; 108 varas = 160 Hamburgh ells. 1 fanega = 3 bushels nearly, or 100 lbs. Spanish. An arroba of wine or spirits = 4·1 English wine gallons nearly. A hogshead of sugar = 1,200 lbs.; a bag of coffee = 150 lbs.; a hogshead of molasses = 110 gallons; a pipe of tafia or rum = 120 gallons; and a bale of tobacco = 100 lbs.

The usual Commission charged by merchants on the sale of goods is 5 per cent., with a *del credere* of 2½ per cent. if the sales are on credit and guaranteed, and a further commission of 2½ per cent. for the return whether in bills or produce. On purchases the commission is ½ per cent., and a further 2½ per cent. if drawn for in bills of exchange. For procuring freight 5 per cent. is charged, and 2½ for insuring the amount. For advances of money the rate is 5 per cent. when no other commission is chargeable. Bill business is done at various rates, from 1 to 2½ per cent. according to its magnitude. These are the rates of the foreign houses; those of the Spanish and Creole merchants are generally higher. There is no obstacle whatever to the establishment of foreigners as merchants in the island. The law says that those who are naturalised in Spain may freely carry on trade with the same rights and obligations as the natives of the kingdom, and that those who have not been naturalised, or have a legal domicile, may still carry on trade under the regulations stipulated in the treaties in force between the respective governments; and in default of such conventional regulations, the same privileges are to be conceded as those enjoyed by Spaniards carrying on trade in the country of which such foreigners are natives. In practice, this last condition is not much attended to; as foreigners are allowed to establish themselves as merchants without any inquiry as to the rights and privileges enjoyed by Spaniards in the country they come from. As to manufacturers and mechanics, the only difficulty that can arise regards their religion. On entering the island every stranger is required to find security in the following terms:—"I am responsible and become security in every case for the person and conduct of A. B., arrived from C. in the ship D., binding myself to present him if called on by the government, and to conduct him at my expense to any place that may be designated." This security is easily obtained, and, in fact, encouragement is given to mechanics, and white people of all classes, to settle in the island. After landing it is only necessary to apply for a letter of domicile, and to present a certificate that the applicant is of a respectable character, and professes the Roman Catholic religion. Free coloured people, however, by a royal order of the 12th March, 1837, are prohibited from landing under any pretence whatever; and so rigorously is this order enforced, that such persons, though acting as seamen, are, on their arrival, taken out of the vessels in which they have come, and are kept in custody until her departure, when they are compelled to proceed again on board and leave the island. The business of a broker is exercised under a royal licence, and no foreigner is eligible to the office unless naturalised in the form prescribed by law. In every commercial town a certain number only is allowed, corresponding with the population and trade of the place. In the great cities, the business of merchant is often combined with that of planter; and sometimes, also, the importing merchant keeps a shop or store, where he sells his goods by retail. The foreign merchants are generally regarded as transient visitors, who go there for the purpose of accumulating such a fortune as may enable them to live with some degree of comfort in their own country. As a class they are not considered wealthy, but they are almost all in the full enjoyment of credit. The mercantile capital, as well as the proprietary wealth of the island, may be said to be concentrated in the hands of the Creoles. When the emigrants from the Peninsula make fortunes in the island, they seldom think of returning to Europe.

Customs Duties in 1848.—The tariff of Cuba, like that of Spain, is exceedingly complex, being divided into a great many classes, and embracing a vast number of articles, many of which are of very trifling importance. All, or almost all, the articles of import are valued in the tariff at certain fixed rates, upon which the duties are charged at so much per cent. Hence, when the fixed or tariff prices exceed the real prices of the goods the duties are proportionally increased; and conversely when the tariff prices are under the real prices. The duties vary from

per cent.

3½ to 27½ on go ds by foreign vessels from foreign ports.
23½ to 19⅛ on foreign goods by Spanish vessels.
17½ to 14½ on Spanish produce from Spain by foreign ships.
7⅛ on Spanish produce by Spanish vessels, and only
3½ if Rice. A balance duty of 1 per cent. is added to all but the 7⅛ and 3½ per cent. duties.

The principal exception to the above rule is in the case of flour, which pays a fixed duty of

2·00 Dolls. per brl. per Spanish ship } from Spain.
·6·75 - - per Foreign ship }
8·58 - - per Spanish ship } from other parts.
9·59 - - per Foreign ship }

Had Spain been able to supply Cuba with flour as cheaply as other countries this high discriminating duty in favour of Spanish flour would have been of comparatively little importance. But such is not the case. Cuba derives nine tenths of her supply of flour from the U. States, principally from New Orleans; so that the discriminating duty is the most oppressive and impolitic that can be imagined. We are surprised it is submitted to. Ploughs, furnace-mouths, grate-bars, crown-wheels, shafts, rollers, sugar-bowls, skimmers, steam-engines, and other such articles for sugar estates; also mares, stallions, and asses, are exempted from duty.

Special concessions have also been made in favour of the Gas Company, &c., which pays only 7½ per cent. on imports.

We subjoin a note of the duties on the principal articles of export, according to the tariff of 1848.

Articles.		Denomination.	Foreign Ships.	Spanish Ships.
			Cents.	*Cents.*
Cigars	per	Mille.	90	50
Cocoa	—	Arrob.	18	10 to 8
Coffee	—	Qtl.	20	12
Copper ore	—	-	9	9
Hides in the hair	—	One.	11	5 to 6
Honey	—	Hhd.	1·37	76 to 57
Molasses	—	do.	Free.	Free.

Sugar	—	Box.	37	27·5
Tobacco	—	Ql.	1·50	·75
Wax, white	—	Arr.	33	18 to 14
yellow	—	—	22	12 to 9

But a new or supplementary tariff, issued in 1850, provides as follows: viz.

Art. 1. augments the duties upon all articles of foreign importation at 1½ per cent.

Art. 2. increases one-seventh the impost upon national imports.

Art. 3. increases the export duty upon each box of sugar 50 cents, which makes now 87½ cents per box.

Art. 4. increases 25 cents upon each quintal of leaf tobacco imported.

Art. 5. increases 25 cents upon every 1,000 cigars, making 75 cents per 1,000 export duty.

Art. 6. Spanish flour to pay one-seventh additional to the duty now paid.

Art. 7. This extraordinary exaction will continue in force two years.

Goods in deposit, withdrawn for consumption, will be subject to the same duties, at and after the period above designated.

For the better comprehension of dealers, and to facilitate the tax upon national commerce, the impost will be 1 per cent. direct upon the custom dues, as equivalent to the 1-7th addition, and upon Spanish flour, 25 per cent. per bbl.

The usual 1 per cent. upon the total of the custom duties is still retained.

Customs Regulations. — Every ship-master is bound to have on his arrival ready for delivery to the boarding officers of the revenue, a manifest, containing a detailed statement of his cargo and ship stores, and in the act of handing it over, has to write thereon an oath, that he has no other cargo on board, and the hour when he delivers it, taking care that it be countersigned by the boarding officers. Within 12 hours, which begin to count from the moment he delivers such manifest until 7 o'clock in the evening, and again from 6 o'clock in the morning until the moment the said 12 hours elapse, he can make any alteration by *presenting a separate note* in which he specifies the errors he may have committed in the manifest. After the expiration of these 12 hours no alteration will be permitted. *Goods not manifested* will be confiscated without remedy; and if their value should not exceed 1,000 dollars, the master of the vessel will be liable to pay a penalty of double the amount of such non-manifested goods; if they exceed that sum, and belong to the master or come consigned to him, his vessel, freight, and other emoluments will be forfeited to the revenue. *Goods over manifested* will pay duties as if they were on board. *Goods not manifested, but claimed in time by a consignee,* will be delivered up to the latter, but the master in this case will be subject to a fine equal in amount to that of such goods. *Gold and silver* not manifested by either master or consignee, are liable to a duty of 4 ⅜ cent. *Goods falling short* of the quantity manifested, when landed, and not being included in any invoice of consignee, will render the master liable to a penalty of 200 dollars for each package so falling short. *Every master* must present himself, within 24 hours after his arrival, at the Custom-house, in order to swear to his manifest, in neglect of which he is liable to a fine of 1,000 dollars. *Every consignee* is obliged to present a detailed note of goods within 48 hours after the arrival of a vessel; if not, such goods are liable to 2 ⅜ cent. extra duty; the same is the case if such notes do not contain a statement of the number of pieces, contents, quantity, weight, and measure. Every vessel is required to bring a bill of health certified by the Spanish consul at the port of her departure, or that nearest to it, otherwise they are placed in quarantine.

Tonnage Duties on foreign ships 12 rs. per ton; on Spanish ships, 5 rs. per ton.

Port Charges on a Vessel of 240 tons, arriving in the Havannah in Ballast, and taking away a Cargo.

	If Foreign.		If Spanish.	
	Dolls.	*Cts.*	*Dolls.*	*Cts.*
Captain of port in and out	6	0	6	0
Health visit, ½ real per ton	10	0	5	0
Interpreter's fee	2	0		
Translation of manifest, in ballast	2	0		
Governor's fee	2	0	2	0
Moro light	4	0	4	0
Tonnage duty, $1½ and 1 per cent.	363	60	151	50
Mud machine, 1½ rs. and 1 per cent.	52	50	52	50
Wharfage and stage hire, 10 rs. per 100 tons per day of the vessel's being at the wharf.				
Custom-house visit on entry outwards, clearing visit, annotation fee, stamp paper, &c., about	34	0	34	0
Bill of health and certificate	8	0	8	0
Lighterage, 10 cts. a box, say on 1,600 boxes	160	0	160	0
Consul's fees, about	4	0		
Pilotage (if a pilot be called)	10	0	10	0
Fees whilst discharging ballast, $1 per day, say 5 days	5	0	5	0
Hoisting and stowing cargo, 8 cts. per box	128	0	128	0
Stamps and boat hire	8	90	8	90
	800	0	574	90
Commission for advice and trouble, 2½	20	0	14	37
	820	0	589	27

If the vessel arrive and sail in ballast, or without breaking bulk, she avoids the health visit, Moro light, tonnage, and mud engine dues. If she bring cargo, the translation of manifest is more, according to its length, wharfage dues are incurred for the time of discharge, and the tidewaiters charge $5½ for each day. Vessels taking entire cargoes of molasses pay no tonnage duty.

In compiling this article, we have consulted Humboldt's *Essai Politique sur l'Ile de Cuba*, Paris, 1826; and the Supplement (*Tableau Statistique*) thereto, Paris, 1851; *Geog. Dict.* arts. *Cuba* and *Havannah*; the *Balanza Mercantil* for various years; *private communications* from Cuba; and papers laid before parliament.

HAVRE, OR HAVRE DE GRACE, a commercial and strongly fortified sea-port town of France, on the English channel, near the mouth of the Seine, on its northern bank, lat. 49° 29′ 14″ N., lon. 0° 6′ 38″ E. Population, in 1851, 28,954, to which may be added 5,000 or 6,000 more for the crews of the shipping constantly in the port. It was a saying of Napoleon that "*Paris, Rouen, Le Havre, ne forment qu'une seule ville, dont la Seine est la grande rue.*" Havre being, in fact, the sea-port of Paris, most of the colonial and foreign products destined for its consumption are imported thither. Nearly double the quantity of goods, estimated by weight, is annually imported at Marseilles; but the total value of the imports at Havre amounts very nearly to that of those at the former port. The principal imports are cotton, sugar, coffee, linen thread and linen goods, rice, indigo, tobacco, hides, dyewoods, spices, drugs, timber, iron, tin, dried fish, &c.: grain and flour are sometimes imported and sometimes exported. The principal exports are silks, woollen and cotton stuffs, lace, gloves, and shoes, trinkets, perfumery, champagne and other wines, brandy, glass, furniture, books, &c.

The Harbour, which is the best and most accessible on this part of the French coast, consists of 3 basins separated from each other and from the outer port by 4 locks, and capable of accommodating about 450 ships. A large body of water being retained by a sluice, and discharged at ebb tide, clears the entrance to the harbour and prevents the accumulation of filth, sand, &c. Cape de la Heve, forming the northern extremity of the Seine, lies N.N.W. from Havre, distant about 2½ miles. It is elevated 390 feet above the level of the sea, and is surmounted by 2 lighthouses 50 feet high. These, which are 325 feet apart, exhibit powerful fixed lights. There is also a brilliant harbour-light at the entrance to the port, on the extremity of the western jetty. Havre has 2 roadsteads. The greater or out road is about a league from the port, and rather more than ⅓ league W.S.W. from Cape de la Heve; the little or inner road is about ½ league from the port, and about ¾ of a mile S.S.E. from Cape de la Heve. They are separated by the sand bank called Leclat; between which and the bank called *Les Hautes de la Rade* is the north-west passage to the port. The Hoc, or southern passage, lies between the last mentioned bank and that of Amfar. In the great road there is from 6 to 7½ fathoms water at ebb; and in the little, from 3 to 3½. Large ships always lie in the former. The rise of the tide is from 22 to 27 feet: and by taking advantage of it, the largest class of merchantmen enter the port. The water in the harbour does not begin per-

ceptibly to subside till about 3 hours after high water,—a peculiarity ascribed to the current down the Seine across the entrance to the harbour being sufficiently powerful to dam up for a while the water in the latter. Large fleets, taking advantage of this circumstance, are able to leave the port in a single tide, and get to sea, even though the wind should be unfavourable.—(See *Plan of Havre*, published by Laurie; *Annuaire du Commerce Maritime; Coulier sur les Phares*, p. 59, &c.)

The Chamber of Commerce of Havre have recently published the following information and instructions for the use of vessels frequenting the port:—

"Five buoys have been moored in the shallows Ruvun, under the designation of the Banc de l'Eclat, and Hautes de la Rade.

"These buoys are similar in form, but of different colours, viz.: The first to the northward is white; the second, white with a black top; the third is black; the fourth is black with a white top; the fifth is red.

"Vessels must always come to anchor at a distance of at least five cables' length outside the line of these buoys, which they may not pass without danger before one hour and a half prior to high water, or four hours after ebb; and they must at all times pass at a distance of five cables' length from the black as well as from the red buoy, both of which are moored on the shallowest parts of these banks. Nevertheless ships may at all hours of the tide frequent the north-western passage, comprised between Cape La Heve and the two northernmost buoys.

"All vessels using the north-western passage, and bound into the inner roadstead (Petit Rade), must steer for the white buoy, the farthest north and after leaving it a little distance on the starboard hand, should then stand towards the second white buoy, taking care never to come so close to the shore as altogether to lose sight of the lantern of the northernmost lighthouse on Cape La Heve. When the light of the north-western pier head bears by compass S.E. and the lighthouses on the Heve bear by compass N.N.E., the ship may be brought to an anchor.

"Besides the five buoys herein described, one of lesser dimensions has been moored on the shallows of the inner roadstead, at about five cables' length W.N.W. of the north-west pier head. Vessels of light draught of water coming to an anchor in that part of the road, should give this buoy an offing of at least one cable's length."

Most part of the goods imported into Havre are destined for the internal consumption of France. The coasting trade has increased very largely of late years, as is proved by the great increase of French wines, soaps, and other produce imported at Paris from Havre, instead of being sent to the capital by land. The coasting vessels transfer their cargoes partly to steamers and partly to large barges, called *chalands*, which are towed by steam tugs as far as Rouen, and thence by horses to Paris. The foreign trade of the port is also very extensive. There annually enter the port about 800 ships from parts out of Europe. Lines of sailing packets are established between Havre and New York, New Orleans, &c. A regular intercourse by means of steam packets is kept up with London, Southampton, and other ports. The entrances to the basins are too narrow to admit the passage of the largest steamers, which have, in consequence, to remain in the outer port imperfectly sheltered from the winds. Indeed the port is at present inadequate to the proper accommodation of the great and growing trade of which it is the centre, and extensive works have been undertaken for its improvement.

There belonged to the port, on the 31st December, 1857, 426 sailing vessels of the aggregate burden of 121,257 tons, and 67 steamers, aggregate burden 13,615 tons. The customs duties which in 1837 produced 18,123,993 francs, had increased in 1857 to 43,856,000 francs.

The Monies, Weights, and Measures of Havre are the same as those of the rest of France; for which see arts. BORDEAUX, COINS, and WEIGHTS AND MEASURES.

Pilotage.—From the outer roadstead 28 francs per 1st 100 tons; 25 fr. 2nd do.; 23 fr. 3rd do.; and the pilot to be fed. If the vessel be boarded nearer the port the charge is lessened accordingly. Boats from 9 to 30 frs. according to the distance.

Port Charges.—With coals, 75 cent. per ton in dock; 37½ do. in harbour. General cargo, 2 fr. 50 c. if in dock; 1 fr. 65 c. if in harbour. Salvage dues, 5 cent. and 10 per ct. Tonnage do. 66¾ cent. and 10 per ct. No charge for lights, buoys, or beacons.

Ballast delivered along side.—Clean, 1 fr. 95 c. per ton; common do. 1 fr. 14 c. do. The ton of clean ballast may be estimated to weigh about 15 or 16 cwt. The ton of common ballast, about 20 cwt.; a cart marked ½ metre is one ton; a cart marked 1 metre is two tons. Cost of removal of ballast landed from ship, 64 c. per ton, without distinction of quality.

Harbour Rules.—1. It is forbidden to have fire, or lighted candle, or to smoke on board ships in the harbour.

2. Vessels coming into and lying in the docks must have the lower and topyards topped up, jibbooms and martingales rigged in, and anchors taken in. The wharf alongside the vessel must be swept every evening.

3. No gunpowder (whatever may be the quantity) is allowed to remain on board, and must be deposited in the gunpowder warehouse.

4. All foreign sailors found away from their ships after 10 o'clock at night, from the 1st of April to the 1st of October, and after 9 o'clock from the 1st of October to the 1st of April, shall be conveyed to prison and fined. Sailors are forbidden to wear sheathing knives ashore.

5. The manifest of the cargo, signed by the captain, must be exhibited to and signed by the custom-house officers before being taken ashore. The vessel must be reported at the custom-house within 24 hours after arrival.

6. Tobacco, snuff, segars loose or in boxes, belonging to the captain, officers and mariners, to be declared as exactly as possible. All the tobacco, snuff and segars declared or not declared, to be exhibited to the custom-house officers when they come and make the visit on board. After such exhibition, if any quantity of tobacco and segars be found on board, it shall be seized, the captain shall be condemned to pay a fine which may be as high as 500 francs, and the ship shall be confiscated.

PORT CHARGES.—Charges on a British Vessel from England or an English Possession.

Pilotage in	28 fr. for the 1st hundred tons 25 fr. for the 2nd hundred tons 23 fr. for the 3rd hundred tons, and above	Tonnage dues	*f. c.* 0 66¾ per ton and 10 per cent 0 37½ per ton harbour dues 0 75 per ton dock dues 1 65 per ton harbour dues with other cargoes 2 50 per ton dock dues with other cargoes 0 5 per ton salvage duty, & 10 per cent. 1 25 stamps
Boats of help in	1¼ per cent. for the head pilot 24 fr. outside the banks 12 fr. outside the piers 9 fr. in the harbour		for vessels with coals only and 1-20th of their cargoes with bricks or grindstones From 3 fr. 85 c. to 18 fr. 15 c. for clearances according to his tonnage

1858	713	1,799	4,160	6,672	1,050,465

Customs Duties at Havre, Marseilles, Nantes, and Bordeaux, in 1847, 1850, 1855, and 1857.

Years.	Havre.	Marseilles.	Nantes.	Bordeaux.
1847	26,012,000 *fr.*	34,742,000 *fr.*	15,918 000 *fr.*	14,957,000 *fr.*
1850	26,111,000	32,530,000	11,498,000	12,047,000
1855	48,858,000	37,813,000	24,687,000	18,141,000
1857	43,856,000	34,912,000	29,676,000	17,812,000

The total customs-revenue collected in 1857 at these and other collectorates amounted to 221,196,210 fr., of which Havre contributed 20 per cent.

Prices of Commodities, Duty paid and in Bond, Duties, Tares, Commercial Allowances, &c. — These important particulars may be learned by the inspection of the subjoined Price Current for the 9th of February, 1859. The duties on some of the articles mentioned in it will, most probably, at no very distant period, be varied. But the other particulars embodied in it will always render it an important document.

	Duty paid. Fr. ct.	Fr. ct.	In Bond. Fr. ct.	Fr. ct.
Ashes, per 50 kil.				
Pot, New York	40 0 to 41 0		0 0 to 0 0

Duty on gross weight: by French vessels from European ports, 3 fr.; from elsewhere, duty free. By foreign vessels, 3 fr. 60 ct.—(See Note A.) Allowance, 1 to 2 per cent.

Explanatory Remarks.

The above duties include the surtax, which is now 20 per cent.; the Custom-house admits the real tare whenever the importer desires it.

Note A.—The treaties of reciprocity entered into with the countries hereafter mentioned, introduce the following deviations from the above rates of duty.

United States.—The produce of the United States, except that of the fisheries, direct from the United States in United States vessels, pays the same duty as if imported by French vessels from the United States.

Brazils and Mexico.—The produce of the Brazils and Mexico imported direct in national vessels enjoys also the above privilege.

The weight of 50 kil. is equal to 110¼ lb. English, or 100 lb. English are equal to 45 35-100 kil., and the cwt. equal to 50 79-100 kil.

Credit.—4½ months, excepting coffee, pimento, pepper, quicksilver, and clayed sugars, which are sold at 3½ months, and wheat at 2½ months.

China, and places beyond the Sunda Islands.—All natural produce, sugar excepted, imported direct, by French vessels, from countries situated beyond the Straits and the Sunda Islands, either to the north of the third degree of northern latitude, or to the east of the 105th degree of eastern longitude, is admitted at four fifths of the lowest rates of duty of the tariff, the French colonial duty alone excepted.

We avail ourselves of this opportunity to lay before our readers the following details with respect to the

Trade of France in 1857, &c.

N. B. — *General commerce*, as applied to imports, means all articles imported by sea or land, without inquiring whether they are intended to be consumed, re-exported, or warehoused. *Special commerce*, as applied to imports, means such imported articles as have been admitted for home consumption, under payment of the customs duties.

The same distinction obtains in relation to exports. *General commerce*, in this case, means all exported articles, without regard to their origin; while *special commerce* means such only as are produced by the soil or manufacturers of France.

The great articles of import consist of raw cotton; raw silk; wool; timber; coal; sugar, coffee, and other colonial products; olive oil and oil seeds; hides and skins; copper; tobacco; indigo and other dye stuffs; flax and thread, &c. The articles of export consist of silk, cotton and woollen goods; wines; hard goods, toys, pedlars' wares, and wooden goods; wrought skins; linen and canvass; paper; brandy; refined sugar; madder; tanned leather; perfumery; linen and linen goods, &c. &c. The imports and exports of wheat and flour depend principally on the seasons. We have elsewhere inserted a table (antè, p. 446.), which sets their influence in this respect in a very striking light. During the cycle of abundant seasons, from 1848 to 1852, France supplied us with large quantities of wheat and flour, especially the latter. But speaking generally, the imports of these articles into France materially exceed the exports. In 1857 the total real value of the imports into France amounted to 2,689,100,000 fr., of which those entered for consumption were valued at 1,872,900,000 fr. The actual value (*valeur actuelle*) of the exports of articles the growth and produce of France, during the same year, was estimated at 1,865,800 fr. The *official* values of the principal articles of import and export are seen in the previous tables, p. 671.

Account of the Exports from France in 1857, specifying the Official Value of those sent to each Country, and distinguishing between General and Special Commerce.—
(*Administration des Douanes*, 1857, p. 6.)

The mercantile marine of France has increased little, if anything, since 1830, though it has gained materially in efficiency by the greater employment of steam ships. It comprised, on the 31st December, 1857, 14,845 sailing vessels, of the agg. burden of 980,465 tons, and 330 steamers, of the agg. burden of 72,870 tons. Hence it is evident that the entire mercantile navy of France does not amount to two-thirds that of the single city of N. York!

Trade between France and England.

Nothing can more strikingly illustrate the mischievous influence of commercial restrictions than the history of the trade between Great Britain and France. Here we have two countries of vast wealth and population, near neighbours, and each possessing many important articles that the other wants, and yet the intercourse between them

since 1689 has generally been inconsiderable. At a distant period this was not the case. Previously to the accession of William III., the importation of wine only from France amounted to about 13,500 tuns a year, our imports of brandy and other articles being proportionally large. But Louis XIV. having espoused the cause of the exiled family of Stuart, the British government, not recollecting that the blow they aimed at the French would also smite their own subjects, imposed, in 1693, a *discriminating* duty of 8*l.* a tun on French wine, and in 1697 raised it to no less than 33*l.* a tun! It is probable that this excess of duty would have been repealed as soon as the peculiar circumstances in which it originated had disappeared; had not the stipulations in the famous commercial treaty with Portugal, negotiated by Mr. Methuen, in 1703, given it permanence. According to this treaty, we bound ourselves for the future to charge 33⅓ per cent. higher duties on the wines of France imported into England, than on those of Portugal; the Portuguese, by way of compensation, binding themselves to admit our woollens into their markets in preference to those of other countries, at a fixed and invariable rate of duty.

Though very generally regarded, at the time, as the highest effort of diplomatic skill and address, the Methuen treaty was, undoubtedly, founded on the narrowest and most contracted views of national interest; and it, in consequence, proved, in no common degree, injurious to both parties, but especially to England. By binding ourselves to receive Portuguese wines for *two thirds* of the duty payable on those of France, we, in effect, gave the Portuguese growers a monopoly of the British market; at the same time that we excluded one of the principal equivalents the French had to offer for our commodities, and provoked them to retaliate. This, indeed, was no difficult task. Unhappily, they were but too ready to embark in that course of vindictive policy of which we set them the example; so that, prohibitions on the one side being immediately followed by counter-prohibitions on the other, the trade between the two countries was nearly annihilated! But the indirect were still more injurious than the direct consequences of this wretched policy. It inspired both parties with feelings of jealousy and dislike, and kept them in the frowning attitude of mutual defiance. Each envied the other's prosperity; and being disposed to take fire at even fancied encroachments, the most frivolous pretexts were sufficient to engage them in contests that have filled the whole world with bloodshed and confusion. But had things been left to their natural course,—had an unfettered commercial intercourse been allowed to grow up between the two countries,—the one would have formed so near, so vast, and so profitable a market for the produce of the other, that they could not have remained long at war without occasioning the most extensively ruinous distress,—distress which no government would be willing to inflict on its subjects, and to which, though the government were willing, it is most probable no people would be disposed to submit. A free trade between England and France would give these two great nations *one common interest*. It would occasion not only a vast increase of the industry, and of the comforts and enjoyments, of the people of both countries, but would be the best attainable security against future hostilities. "We know," said Mr. Hyde Villiers, in his speech of the 15th of June, 1880, "that British enterprise will fetch the extremest points on earth in the business of exchange; but here are the shores of France nearer to England than those of Ireland itself—nay, Bordeaux is commercially nearer to London than it is to Paris; and, but for the lamentable perversion of the gifts and dispositions of nature, and of the ingenuity of man, the highways of commerce between these countries—the seas which surround Great Britain and Ireland, and wash the shores of France—should literally swarm with vessels, engaged, not only in the interchange of material products, but in diffusing knowledge and stimulating improvement; in creating everywhere new neighbourhoods; in consolidating international dependence; in short, in drawing daily more close the bonds of international peace and confidence, and thus advancing, while they also served to confirm and secure, the peace, the civilisation, and the happiness of Europe."*

The commercial treaty which Mr. Pitt negotiated with France in 1786 was the first attempt to introduce a better system into the trade between the two countries; and it is one of the few treaties of this description that have been bottomed on fair and liberal principles. But the revolution in France, and the lengthened and bloody wars by which it was followed, totally suppressed that mutually beneficial intercourse which had begun to grow up under Mr. Pitt's treaty, and revived and embittered all the old hostile feelings and prejudices inherited by both parties. Since the peace of 1815 the animosities and prejudices in question have, however, been much mitigated. The

* We regret we have to add, that this was one of the last public appearances made by Mr. Villiers. He died in December, 1832, at the early age of 31. His death was a national loss. Few have entered upon public life with better dispositions, more enlarged and comprehensive views, or a more sincere desire to promote the happiness of their species.

abolition of the discriminating duty on French wine, in 1831, had a considerable influence in bringing about this improved state of things, at least in a commercial point of view. And since then we have given a still greater extension to the same enlightened policy by reducing the oppressive duty formerly laid on brandy, and the high duties on silks and other articles of French produce. It should, also, be borne in mind, that France has profited largely by the repeal of our corn laws. Her exports of wheat and flour to our markets have been much greater than any one anticipated; and have conduced greatly to the advantage of the agriculturists of Normandy, and generally of the N. W. departments of France.

There has, in consequence, been a very great extension of the trade between the two countries; though it is still but trifling compared to what it would be were it allowed to attain to its full development. But we regret to have to say, that hitherto the French have shown but little inclination to reciprocate the liberal policy of which we have set them an example. On the contrary, their policy, if so we may call it, has become, in some respects, more anti-commercial than ever. In 1836, for example, the French government having considerably reduced the high duties that were then imposed on foreign linens and linen yarn, the imports of both articles rapidly in-

creased, and a powerful stimulus was given to the trade of France. But, as might have been expected, the linen manufacturers and spinners, whose monopoly had been interfered with, felt aggrieved by this new state of things; and instead of endeavouring to withstand the competition of their foreign rivals, by improving their fabrics and cheapening their processes, they found it more convenient to appeal to popular prejudice; and to represent themselves as sacrificed, through a false policy, to the cupidity of foreigners, who, to ensure their ruin, sold their products at less than they cost! And this contradictory nonsense induced the government to retrace its steps; to re-impose the high duties on foreign linens and yarns; and, consequently, to increase the price of a necessary, and to check or prevent the production and exportation of the articles which had been sent abroad in payment of the linens. (See art. Linen.)

The same *felo de se* policy prevails in regard to the trade in cottons and most other things. But the restrictions on the importation of iron may, notwithstanding the reductions made from their amount in 1853, be regarded as the triumph of the protective system in France. Everybody knows that a cheap and abundant supply of iron is indispensable to anything like successful agriculture or manufactures; and everybody knows, none better than the Emperor of the French, that owing to the scarcity and bad quality of coal in France, and the necessity of using wood in the smelting of minerals, she has no facilities for the production of iron, which consequently costs a very large sum. Under these circumstances it might have been expected that the French would open their ports to the iron of all countries; and that if they did not encourage its importation by a bounty, they would, at all events, take especial care not to check it by a duty. But no; they have been so enamoured of bad and dear ploughs, and of bad and dear implements and machinery of all sorts, that they imposed all but prohibitory duties on foreign iron. Under Napoleon I. duties of 44 fr. and 110 fr. per ton were laid respectively on bar and sheet-iron; and these, though justly objectionable for their too great magnitude, compared with its price, were afterwards raised till they amounted, under Napoleon III., to 200 fr. (8*l.*) and 440 fr. (17*l.* 12s.) per ton! But these monstrous duties were reduced, as already stated, in 1853, to about a half. They are still, however, a great deal too high; in fact, they ought not to exist at all. Were they repealed, iron would be as abundant and cheap in France as in England; whereas it is comparatively scarce and exorbitantly dear. And this forced scarcity and high price of the most important industrial agent, paralyses agriculture and all the more important arts, and brings them almost to a stand. And for what is this immense sacrifice incurred?—to gratify the rapacity of a handful of forest proprietors, who contend that they would suffer were foreign iron admitted duty free, or at a moderate duty! The French do not kill the goose for the sake of the eggs, but for the offal she has picked up.

It would be a libel on an intelligent people to suppose that such a system should be permanent. But our policy cannot be affected by its duration. The French may, if so disposed, prefer monopoly to freedom, and scarcity to abundance. Our business is to deal with all the world on fair and liberal principles, without inquiring or caring what may be the folly or the wisdom of others.

The great articles of importation into the U. Kingdom from France consist of brandy, wine, madder, silk manufactures and raw silk, wheat and wheat flour, gloves, boots and shoes, eggs, fruits, skins, books, &c. It should, however, be observed that a large proportion of the imports of raw and thrown silk consists, in fact, of imports from Italy, which come to us, *in transitu*, through France.

The great articles of export from this country to France consist of coal and iron, silk and cotton manufactures, including lace and patent net; copper and copper manufactures, linens and linen yarn, cotton manufactures, horses, hardware and cutlery, machinery, wool, spirits, hosiery, &c.

Increase in the Commerce of France. — This increase has been very great of late years. This is evident from the following

Account of the aggregate Values of the Import and Export Trade of France during each of the 30 Years ending with 1856, divided into Decennial Periods.

Years.	General Commerce. Value of Imports and Exports.	Special Commerce. Value of Imports and Exports.	Years.	General Commerce. Value of Imports and Exports.	Special Commerce. Value of Imports and Exports.

1842	2,082 „	1,491 „	Decennial average -	3,136 „	2,205 „
1843	2,179 „	1,533 „			

It appears from this official statement that, at an average of the 10 years ending with 1836, the total aggregate value of the imports and exports of France amounted to 1,366 millions a year; during the next decennial period, or that ending with 1846, it had increased to 2,112 millions; while during the decennial period ending with 1856, it amounted to no less than 3,136 millions. It is difficult to account for its rapid increase during the last 10 years, inasmuch as they have been characterised by the occurrence of several bad harvests, not in corn merely, but also in the great staples of silk and wine; by destructive inundations; and by the waste of life and capital resulting from the war with Russia. The circumstances capable not merely of countervailing the injurious influence of the causes now referred to, but of turning the balance greatly the other way, must have been of a very powerful description. At their head is the greater confidence inspired by the existing government, and the powerful influence it has had on all sorts of industrial undertakings; and we are also inclined to attribute a large share in the progress that has been made to the influence of the gold discoveries on the trade of this country and the U. States, and the great increase in the amount of their imports from France. The completion of railroads, and other improved means of intercourse, have, no doubt, also contributed to develop the resources of the country and her great powers of production. Nothing, indeed, but the adoption of a reasonable law of succession, and of a liberal commercial system, is wanted to elevate France to a very high, if not to the highest, place among manufacturing and commercial nations; and considering the way in which her energies are weighed down by oppressive duties and restrictions, her recent industrial progress is quite marvellous.

There has been, as already seen, a great decrease in the imports into France in 1858 as compared with 1857 and 1856. But this has been to a considerable extent occasioned by the reduced imports of corn, resulting from the abundant harvest of 1858, and is, in so far, an advantage. The vine disease, which now happily seems to be on the decline, has also operated injuriously on the trade of France.

HAWKERS AND PEDLARS. It is not very easy to distinguish between hawkers and pedlars. Both are a sort of itinerant retail dealers, who carry about their wares from place to place; but the former are supposed to carry on business on a larger scale than the latter. They are subject to the same regulations.

Regulations as to Hawkers and Pedlars.— The legislature has always looked with suspicion upon itinerant dealers; and has attempted, by obliging them to take out licences, and placing them under a sort of *surveillance*, to lessen their numbers, and to hinder them from engaging in dishonest practices. But the resident dealer has so many advantages on his side, that these precautions seem to be in a great measure superfluous. It should also be recollected, that before shops were generally established in villages and remote districts, hawkers and pedlars rendered material services to country people; and even now the competition which they excite is certainly advantageous.

By the 50 Geo. 3. c. 41., hawkers and pedlars are to pay an annual licence duty of 4*l.*; and if they travel with a horse, ass, or other beast, bearing or drawing burden, they are subject to an additional duty of 4*l.* for each beast so employed. The granting of licences, and management of the duties, are, by a late act, placed under the control of the commissioners of stamps.

Hawkers and pedlars, unless householders or residents in the place, are not allowed to sell by auction to the highest bidder; penalty 50*l.*— half to the informer, the other half to the king. But nothing in the act extends to hinder any person from selling, or exposing to sale, any sort of goods, in any public market or fair; or to hinder a hawker or pedlar from selling in a hired room, where he is not a resident, provided such sale is not by auction.

Every hawker, before he is licensed, must produce a certificate of good character and reputation, signed by the clergyman and two reputable inhabitants of the place where he usually resides.

Every hawker must have inscribed, in Roman capitals, on the most conspicuous part of every pack, box, trunk, case, cart, or other vehicle, in which he shall carry his wares, and on every room and shop in which he shall trade, and likewise on every hand-bill which he shall distribute, the words "LICENSED HAWKER." Penalty, in default, 10*l.* Unlicensed persons wrongfully using this designation forfeit 10*l.*

Hawkers dealing in smuggled goods, or in goods fraudulently or dishonestly procured, are punishable by forfeiture of licence, and incapacity to obtain one in future, besides being liable to all the other penalties, forfeitures, &c. applicable to such illegal dealing.

By stat. 6 Geo. 4. c. 80. it is enacted, that any person or persons hawking, selling, or exposing to sale, any spirits on the streets, highways, &c., or in any boat or other vessel on the water, or in any place other than those allowed in this act, shall forfeit such spirits and 100*l.* for every such offence. Any person may detain a hawker of spirits, and give notice to a peace officer to carry the offender before a justice.

Hawkers trading without licence are liable to a penalty of 10*l.* So also, if they refuse to show their licence on the demand of any person to whom they offer goods for sale, or on the demand of any justice, mayor, constable, or other peace officer, or any officer of the customs or excise. By 5 Geo. 4. c. 83., hawkers trading without a licence are punishable as vagrants.

To forge or counterfeit a hawker's licence incurs a penalty of 30*l.* To lend or hire a hawker's licence subjects lender and borrower to 40*l.* each, and the licence becomes forfeited. But the servant of a licensed hawker may travel with the licence of his master.

Hawkers trading without a licence are liable to be seized and detained by any person who may give notice to a constable, in order to their being carried before a justice of peace. Constables refusing to assist in the execution of the act are liable to a penalty of 10*l.*

Nothing in the act extends to prohibit persons from selling fish, fruit, or victuals; nor to hinder the maker of any home manufacture from exposing his goods to sale in any market or fair, in every city, borough, town corporate, and market town: nor any tinker, cooper, glazier, plumber, harness-mender, or other person, from going about and carrying the materials necessary to their business.

A *single* act of selling, as a parcel of handkerchiefs to a particular person, is not sufficient to constitute a hawker within the meaning of the statutes.—(*Rex* v. *Little*, B. 613.)

By the 52 Geo. 3. c. 108., no person, being a trader in any goods, wares, or manufactures of Great Britain, and selling the same by *wholesale*, shall be deemed a hawker; and all such persons, or their agents, selling by *wholesale* only, shall go from house to house, to any of their customers who sell again by wholesale or retail, without being subject to any of the penalties contained in any act touching hawkers, pedlars, and petty chapmen.

No person committed under these acts for non-payment of penalties can be detained in custody for a longer period than 3 months.

Hawkers exposing their goods to sale in a market town, must do it in the market-place.

Persons hawking tea without a licence are liable to a penalty under 50 Geo. 3. c. 41.; and even though they had a licence, they would be liable to a penalty for selling tea in an unentered place.—(*Chitty's* edit. of *Burn's Justice*, vol. ii. p. 1113.)

Any person duly licensed to trade as a hawker and pedlar may set up any lawful trade in any place where he is resident, though he have not served any apprenticeship to the same, and, if prosecuted, he may plead the general issue and have double costs.—(See *Chitty's* edit. of *Burn's Justice*, vol. ii. pp. 1102—1124.)

The hawkers' and pedlars' duty produced in 1855, 25,824*l.* gross revenue; the charges of collection are very heavy, amounting to between 4,000*l.* and 5,000*l.* Whatever, therefore, may be the other advantages of this tax, it cannot, certainly, be said to be very productive.

HAY (Ger. *Hew*; Du. *Hovi*; Fr. *Foin*; It. *Fieno*; Sp. *Heno*; Lat. *Fœnum*), any kind of grass, cut and dried for the food of cattle. The business of hay-making is said to be better understood in Middlesex than in any other part of the kingdom. The great object is to preserve the green colour of the grass as much as possible, and to have it juicy, fresh, and free from all sorts of mustiness.

The sale of hay within the bills of mortality, and 30 miles of the cities of London and Westminster, is regulated by the act 36 Geo. 3. c. 88. It enacts that all hay shall be sold by the load of 36 trusses, each truss weighing 56 lbs., except new hay, which is to weigh 60 lbs. till the 4th of September, and afterwards 56 lbs. only; so that till the 4th of September a load of hay weighs exactly a ton, but thereafter only 18 cwt. The clerk of the market is bound to keep a regular book for the inspection of the public, specifying the names of the seller, the buyer, the salesman, and the price of each load. Salesmen and factors are prohibited from dealing on their own account.

There are three public markets in the metropolis for the sale of hay and straw; Whitechapel, Smithfield, and the Hay-market in the vicinity of the Regent's Park. The latter used formerly to be held in the street called the Haymarket.

Straw is sold by the load of 36 trusses, of 36 lbs. each, making in all 11 cwts. 64 lbs.

It is affirmed, we know not with what foundation, that considerable frauds are perpetrated in the sale of hay and straw.

HEMP (Ger. *Hanf*; Du. *Hennip, Kennip*; Da. *Hamp*; Sw. *Hampa*; Fr. *Chanvre*; It. *Canape*; Sp. *Canamo*; Rus. *Konapli, Konopel*; Pol. *Konope*), a valuable plant (the *Cannabis sativa* of Linnæus), supposed to be a native of India, but long since naturalised and extensively cultivated in Italy, and many countries of Europe, particularly Russia and Poland, where it forms an article of primary commercial importance. It is also cultivated in different parts of America, though not in such quantities as to supersede its importation. It is stronger and coarser in the fibre than flax; but its uses, culture, and management are pretty much the same. When grown for seed, it is a very exhausting crop; but when pulled green, it is considered as a cleaner of the ground. In this country its cultivation is not deemed profitable; so that, notwithstanding the encouragement it has received from government, and the excellent quality of English hemp, it is but little grown, except in some few districts of Suffolk and Lincolnshire. The quantity raised in Ireland is also inconsiderable. — (*Loudon's Encyc. of Agricult.*)

Exceedingly good *huckaback* is made from hemp, for towels and common tablecloths. Low-priced hempen cloths are a general wear for husbandmen, servants, and labouring manufacturers; the better sorts for working farmers and tradesmen in the country; and the finer ones, ⅞ wide, are preferred by some gentlemen for strength and warmth. They possess this advantage over Irish and other linens, — that their colour improves in wearing, while that of linen deteriorates. But the great consumption of hemp is in the manufacture of sailcloth and cordage, for which purposes it is peculiarly fitted by the strength of its fibre. English hemp, when properly prepared, is said to be stronger than that of every other country, Russia not excepted; and would, therefore, make the best cordage. It is, however, but little used in that way, or in the making of sailcloth; being principally made into cloth for the uses already stated.

Hemp has been cultivated in Bengal from the remotest antiquity, but not, as in Europe, for the purpose of being manufactured into cloth and cordage. In the Hindoo economy it serves as a substitute for malt; a favourite intoxicating liquor, called banga, being produced from it! This, also, is the use to which it is applied in Egypt. — (*Milburn's Orient. Commerce, &c.*)

The price of hemp fluctuated very much during the war. In consequence of difficulties in the way of its importation, it stood at a very high level from 1808 to 1814. This was the principal circumstance that originally brought iron cables into use; and the extent to which they are now introduced, has contributed materially to diminish the consumption and importation of hemp. — (*Tooke on High and Low Prices*, 2d ed. p. 345.)

We borrow the following particulars, with respect to the hemp trade of Petersburg, from the work of Mr. Borrisow on the commerce of that city: —

Hemp forms a very important article of export from St. Petersburg, and deserves particular notice. It is assorted, according to its quality, into *clean hemp*, or firsts; *out-shot hemp*, or seconds; *half-clean hemp*, or thirds; and *hemp codilla*.

Of the first 3 sorts there are annually exported about 2,000,000 poods, the greatest part in English and American bottoms. It is brought to Petersburg, from the interior beyond Moscow, by water; and its quality depends very much on the country in which it is produced. That brought from Karatshev is the best; next to this, that produced in Belev; hemp from Gshatsk is considered inferior to the latter.

As soon as the hemp is brought down in the spring, or in the course of the summer, it is selected and made up in bundles; both operations being performed by sworn selectors (*brackers*) and binders appointed by government for this purpose; and it is a well-known fact, that this is done with great impartiality and exactness.

A bundle of clean hemp weighs from 55 to 65 poods: ditto out-shot, 48 to 55 ditto; ditto half-clean, 40 to 45 ditto. (1 pood = 36 lbs. avoirdupois.)

Binding of hemp is paid for at the rate of 2 roubles 50 copecks for *clean*, 2 roubles for *out-shot*, and 1 rouble 60 copecks for *half-clean*, per bundle; one half is paid by the seller, and the other half by the purchaser, and is charged accordingly by their agents.

The expense of selecting hemp is 50 copecks per bercovitz (or 10 poods), and is the same for every sort. To every bundle of assorted hemp is attached a ticket with the names of the selector, binder, and owner, and the date and year. Every bundle has also affixed to it a piece of lead, stamped on one side with the name of the selector, and on the other with the sort of hemp and the time when it was selected. The external marks of good hemp are, its being of an equal green colour and free from spills; but its good quality is proved by the strength of the fibre, which should be fine, thin, and long. The first sort should be quite clean and free from spills; the *out-shot* is less so; and the *half-clean* contains a still greater portion of spills, and is moreover of mixed qualities and colours.

As a perfect knowledge of the qualities of hemp and flax can only be acquired by experience and attention, agents usually employ men constantly occupied in this busi-

ness, by which means they are sure of getting goods of the best quality, and have the best chance of giving satisfaction to their principals; because, although the hemp is selected by sworn selectors, yet, owing to the quantity of business and the speed with which it must be executed, &c., there are often great differences in the same sorts. The charges are in this way somewhat increased; but this is trifling in comparison of the advantage gained. The part separated, or picked out in cleaning hemp, is called *hemp codilla*; it is generally made up in small bundles of 1 pood, which are again, when shipped, bound together in large bundles, each consisting of about 30 small ones.

Particular care must be taken to ship hemp and flax in fine dry weather; if it get wet, it heats, and is totally spoiled. For this reason every vessel taking in hemp or flax is furnished with mats to prevent its getting damp. Hemp, being light and bulky, is, when stowed, forced into the hold by means of winches, which renders the operation of loading rather slow.

It may be taken as a general rule, that the prices of hemp are highest in the months of May, June, July, and the early part of August; the demand for this article being then greatest, and the exportation to North America being principally effected at this season. Again, the prices of hemp are lowest in the month of September; the reason of which is, that the less opulent hemp-merchants return at the end of this month to their own country, in order to make new purchases for the ensuing year; and rather than be detained, sell the remainder of their stock some roubles below the market price. This causes a general decline; although an unusual demand for the article happening at the same time, or political events or rumours, occasionally produce a contrary effect. Two large warehouses, called *ambares*, are built in Petersburg, for the special purpose of housing hemp, where the greatest order is observed.

Account of the Quantities of Hemp imported into the United Kingdom during each of the 3 Years ending with 1858; specifying the Countries from which they were imported, and the Quantities brought from each.

Countries.	1856.	1857.	1858.
	Cwts.	*Cwts.*	*Cwts.*
Russia	540,155	580,697	612,174
Austrian Italy	34,566	28,819	26,001
British East Indies	45,396	47,203	73,483
Philippine Islands	28,208	56,117	143,181
Other countries	142,806	79,365	26,971
Total	791,131	792,201	882,110
Jute, and other vegetable substances of the nature of hemp, mostly from India	736,595	646,191	756,250
Grand total	1,527,726	1,438,392	1,638,360

The duty to which hemp was formerly liable was repealed in 1845.

Sixty poods of hemp and 40 poods of codilla make a last at Petersburg; 63 poods make an English ton.—(pp. 47—52.)

Riga hemp fetches a higher price than that of Petersburg. It is divided into 3 sorts: viz. rein, rhine or clean, out-shot, and pass or half-clean. The following are the prices of hemp, as quoted in the London markets, April, 1859.

	£	s.	£	s.
Hemp, St. Petersburg, clean, per ton	30	0	to 0	0
out-shot	29	0	— 29	10
half-clean	27	10	— 28	0
Riga, rhine	31	0	— 0	0
Manilla, free	26	0	— 53	0
Hemp, East Indian Sunn	15	0	— 20	0
Jute	13	10	— 19	0
Coir, rope	24	0	— 32	0
junk	17	0	— 25	0
fibre	23	0	— 30	0

We subjoin a statement of the various charges on the exportation of hemp from Petersburg, and on its importation into this country.

Clean Hemp.—1 bundle = 63 poods = 1 ton.

	Rou.	*cop.*
Duty 3 rou. 60 cop. per bercovitz	22	68
Additional duty, 10 per cent.	2	27
Quarantine duty, 1 per cent.	0	22
	R. 25	17
Custom-house charges, 4 per cent.	1	1
Receiving weighing, and shipping, 3¾ rou. per bundle	3	75
Bracking, 50 cop. per bercovitz	3	15
Binding, 40 cop. per ditto	2	52
Lighterage and attendance to Cronstadt, 8 rou. per bundle	8	0
Rebinding, 2½ rou. per bundle, ½ charged	1	12
Brokerage, 60 kop. per ton	0	60
	R. 45	32

Brokerage, ½ per cent.
Commission and extra charges, 3 per cent.
Stamps on drafts, ½ per cent. } ½ per cent.
Brokerage, ½ per cent. }

Charges of importation per ton, taking the price at 40*l.* per ton.

	£	s.	d.
Insurance, say 1*l.*, and policy	0	10	6
Freight, 52*s.* 6*d.* per ton	2	12	6
Customs and Russia dues	4	15	8
Landing charges	0	10	0
Sound dues	0	5	0
Discount, 3½ per cent.	1	10	0
Brokerage	0	4	0
per ton	£10	5	8

In the above calculation, no allowance is made for damage; which, if care be taken to select a good vessel and an early season, does not amount to much. The estimates are nearly the lowest rates of charge. The insurance, indeed, is sometimes as low as 12*s.* 6*d.* per cent., and policy. That, however, is only in the very earliest part of the season; it rises to 5*l.* per cent. in the autumn.

Out-shot Hemp.—1 bundle = 63 poods = 1 ton.

	Rou.	*cop.*
Fixed charges	46	11
Other charges same.		

Half-clean Hemp.—1½ bundle = 63 poods = 1 ton.

	Rou.	*cop.*
Fixed charges	48	71
Other charges same.		

HEMP (MANILLA) commonly called Manilla white rope. Mr. Crawfurd gives the following account of this article:—"Of the wild banana one kind (*Musa textilis*) grows in vast abundance in some of the most northerly of the spice islands. In the great island of Mindanao, in the Philippines, it fills extensive forests. From the fibrous bark or epidermis is manufactured a kind of cloth, in frequent use among the natives. It also affords the material of the most valuable cordage which the indigenous products of the

Archipelago yield. This is known to our traders and navigators under the name of Manilla rope, and is equally applicable to cables, and to standing or running rigging."—(*Hist. of Archipelago*, vol. i. p. 412.)

HEMP (INDIAN), or SUNN and JUTE. Sunn consists of the fibre of the *Crotolaria juncea*, a totally different plant from the *Cannabis sativa*, which, as already stated, is never used by the Hindoos for cloth or cordage. Sunn is grown in various places of Hindostan. The strongest, whitest, and most durable species is produced at Comercolly. During those periods of the late war when the intercourse with the Baltic was interrupted, and hemp bore an enormous price, large quantities of sunn were imported; but after the intercourse with the Continent was renewed, the importation of sunn ceased for several years. But within the last dozen years it has been again imported to a considerable extent. It is, however, deficient in toughness.

Jute consists of the fibres of two plants, called the chonch and isbund (*Corchorus olitorius* and *Corchorus capsularis*), extensively cultivated in Bengal, and forming, in fact, the material of which gunny bags and gunny cloth are made. It fetches nearly, though not quite, as high a price as sunn. It comes into competition with flax, tow, and codilla, in the manufacture of stair and other carpets, bagging for cotton and other goods, and such like fabrics, being extensively used for these purposes in Dundee. But it is unsuitable for cordage and other articles into which hemp is manufactured, from its snapping when twisted, and rotting in water. The quantities imported, and the prices, have fluctuated very greatly during the last dozen years; but from 12*l.* to 18*l.* a ton appears to be a fair average price. When first introduced into this country, in 1815, the price of jute varied from 35*l.* to 40*l.* a ton. It was then, however, very little used, and did not, in fact, begin to come into anything like general use as bagging till 1827 or 1828.

HEMP-SEED (Fr. *Chenevis, Chenevi*; Ger. *Hanfsaat*; It. *Cannapuccia*; Lat. *Semen cannabinum*; Rus. *Konopljanoe Semja*), the seed of hemp. The best hemp-seed is that which is brightest, and will not break when rubbed. It is used either as seed, or for crushing for oil, or as food for fowls. Previously to 1832 it was loaded with a duty of 2*l.* per quarter, which was then reduced to 1*s.* per ditto, and in 1845, was wholly repealed.

In 1857 we imported 4,727 qrs. of hemp-seed, of which Holland supplied 3,238 qrs. It was valued at 44*s.* a qr. Our exports during the same year amounted to only 32 qrs.

HERRINGS, AND HERRING FISHERY. The herring (*Clupea harengus* of Linnæus) is a fish too well known to require any description. It is everywhere in high esteem, both when fresh and when salted.

"Herrings are found from the highest northern latitudes yet known, as low as the northern coasts of France. They are met with in vast shoals on the coast of America as low as Carolina. In Chesapeake Bay is an annual inundation of those fish, which cover the shore in such quantities as to become a nuisance. We find them again in the seas of Kamtschatka; and probably they reach Japan. The great winter rendezvous of the herring is within the Arctic circle: there they continue for many months, in order to recruit themselves after the fatigue of spawning; the seas within that space swarming with insect food in a far greater degree than those of our warmer latitudes. This mighty army begins to put itself in motion in spring. They begin to appear off the Shetland Isles in April and May. These are only the forerunners of the grand shoal, which comes in June; and their appearance is marked by certain signs, such as the numbers of birds, like gannets and others, which follow to prey on them; but when the main body approaches, its breadth and depth is such as to alter the appearance of the very ocean. It is divided into distinct columns of 5 or 6 miles in length, and 3 or 4 in breadth; and they drive the water before them, with a kind of rippling. Sometimes they sink for the space of 10 or 15 minutes, and then rise again to the surface; and in fine weather reflect a variety of splendid colours, like a field of the most precious gems.

"The first check this army meets in its march southward, is from the Shetland Isles, which divide it into two parts; one wing takes to the east, the other to the western shores of Great Britain, and fill every bay and creek with their numbers: the former proceed towards Yarmouth, the great and ancient mart of herrings; they then pass through the British Channel, and after that in a manner disappear. Those which take towards the west, after offering themselves to the Hebrides, where the great stationary fishery is, proceed to the north of Ireland, where they meet with a second interruption, and are obliged to make a second division: the one takes to the western side, and is scarcely perceived, being soon lost in the immensity of the Atlantic; but the other, that passes into the Irish Sea, rejoices and feeds the inhabitants of most of the coasts that border on it. These brigades, as we may call them, which are thus separated from the greater columns, are often capricious in their motions, and do not show an invariable attachment to their haunts.

"This instinct of migration was given to the herrings, that they might deposit their spawn in warmer seas, that would mature and vivify it more assuredly than those of the frozen zone. It is not from defect of food that they set themselves in motion; for they come to us full of fat, and on their return are almost universally observed to be lean and miserable. What their food is near the pole, we are not yet informed; but in our seas they feed much on the *oniscus marinus*, a crustaceous insect, and sometimes on their own fry.

"They are full of roe in the end of June, and continue in perfection till the beginning of winter, when they deposit their spawn. The young herrings begin to approach the shores in July and August, and are then from ½ an inch to 2 inches long. Though we have no particular authority for it, yet, as very few young herrings are found in our seas during winter, it seems most certain that they must return to their parental haunts beneath the ice. Some of the old herrings continue on our coast the whole year." — (*Pennant's British Zoology.*)

The herring was unknown to the ancients, being rarely, if ever, found within the Mediterranean. The Dutch are said to have engaged in the fishery in 1164. The invention of pickling or salting herrings is ascribed to one Beukels, or Beukelson, of Biervliet, near Sluys, who died in 1397. The emperor Charles V. visited his grave, and ordered a magnificent tomb to be erected to his memory. Since this early period, the Dutch have uniformly maintained their ascendancy in the herring fishery; but, owing to the Reformation, and the relaxed observance of Lent in Catholic countries, the demand for herrings upon the Continent is now far less than in the fourteenth and fifteenth centuries.

Importance of the Herring Fishery. Progress of it in Great Britain. — There is, perhaps, no branch of industry, the importance of which has been so much over-rated as that of the herring fishery. For more than 2 centuries, company after company has been formed for its prosecution, fishing villages have been built, piers constructed, boards and regulations established, and vast sums expended in bounties; and yet the fishery never got into a healthy state till it was left to its own resources. The false estimates that have been long current with respect to the extent and value of the Dutch herring fishery, contributed more, perhaps, than any thing else, to the formation of exaggerated notions of the importance of this business. That the Hollanders prosecuted it to a greater extent, and with far greater success, than any other people, is, indeed, most true. There is not, however, the shadow of a ground for believing that they ever employed, as has often been stated, about 450,000 individuals in the fishery and the employments immediately subservient to it. We question whether they ever employed so many as 50,000. At the time when the Dutch carried on the fishery to the greatest extent, the entire population of the Seven United Provinces did not certainly exceed 2,400,000; and deducting a half for women, and from a half to two thirds of the remaining 1,200,000 for boys and old men, it would follow, according to the statement in question, that every able-bodied man in Holland must have been engaged in the herring fishery! It is astonishing how such ridiculously exaggerated accounts ever obtained any circulation; and still more so, that they should have been referred to and quoted, without, apparently, any doubt being ever entertained of their authenticity, down to our own times! * Had they been sifted ever so little, their falsehood would have been obvious; and we should have saved many hundreds of thousands of pounds that have been thrown away in attempting to rival that which never existed.

It would be impossible, within the limits to which this article must be confined, to give any detailed account of the various attempts that have been made at different periods to encourage and bolster up the herring fishery. In 1749, in pursuance of a recommendation in his Majesty's speech at the opening of parliament, and of a report of a committee of the House of Commons, 500,000*l.* was subscribed for carrying on the fisheries, under a corporation called "The Society of the Free British Fishery." The Prince of Wales was chosen governor of the Society, which was patronised by men of the first rank and fortune in the state. But this Society did not trust entirely to its own efforts for success. The duties were remitted upon the salt used in the fisheries; and besides this reasonable encouragement, a high tonnage bounty was granted upon every buss fitted out for the deep sea fishery. In consequence, many vessels were sent out, as Dr. Smith has truly stated, not to catch herrings, but to *catch the bounty*; and to such an extent was this abuse carried, that in 1759, when the tonnage bounty was 50*s.* the almost incredible sum of 159*l.* 7*s.* 6*d.* was paid as bounty *upon every barrel of merchantable herrings that was produced!* — (*Wealth of Nations*, p. 231.) But notwithstanding this encouragement, such was the waste and mismanagement of the Company's affairs, that it was speedily destroyed. Smith says, that in 1794 hardly a vestige remained of its having ever been in existence.

But notwithstanding this ill success, a new company was formed, for nearly the same objects, in 1786, of which George III. was patron. It has had nearly the same fate. "For a season or two, busses were fitted out by the society; but if every herring caught had carried a ducat in his mouth, the expense of its capture would scarcely have been repaid. The bubble ended by the society for fishing in the deep sea becoming a kind of building society, for purchasing ground in situations where curers and fishermen find it convenient to settle, and selling or letting it in small lots to them, at such advance of price as yields something better than fishing profits." — (See an excellent article on the *Herring Fishery* in the 11th Number of the *Quarterly Journal of Agriculture.*)

In 1808, a fresh attempt was made for the improvement and extension of the fishery. The act 48 Geo. 3. established a distinct set of commissioners for the superintendence of all matters connected with the fishery, and authorised them to appoint a sufficient number of fishery officers, to be stationed at the different ports, whose duty is to see that the various regulations with respect to the gutting, packing, &c. of the herrings, and the branding of the barrels, are duly carried into effect. In 1809, a bounty of 3*l.* per ton was granted on all vessels employed in the deep sea herring fishery, of above 60 tons burden, but payable only on 100 tons; and in 1820, a bounty of 20*s.* per ton, which, under certain specified circumstances, might be increased to 50*s.*, was granted on all vessels of from 15 to 60 tons, fitted out for the shore herring fishery; and, exclusively of these bounties on the tonnage, a bounty of 2*s.* a barrel was allowed on all herrings cured gutted during the 6 years ending the 5th of April, 1815, and a bounty of 2*s.* 8*d.* a barrel on their exportation, whether cured gutted or ungutted. During the 11 years ending the 5th of April, 1826, the bounty on herrings cured gutted was 4*s.* a barrel.

It is stated in the article already referred to, that the cost of a barrel of cured herrings is about 16*s.* the half going to the fisherman for the green fish, the other half to the curer for barrel, salt, and labour. The bounty of 4*s.* a barrel was, therefore, equal to *half* the value of the herrings as sold by the fisherman, and to *one fourth* of their value as sold by the curer! In consequence of this forced system, the fishery was rapidly increased. The following statement, extracted from the *Report of the Commissioners of the Fishery Board*, dated 27th of July, 1843, shows the progress it has made since 1809: —

* They seem to have been first set forth in a treatise ascribed to Sir Walter Raleigh; and, what is singular, they were admitted by De Witt into his excellent work, the *True Interest of Holland.* They have been implicitly adopted by Sir John Barrow, in the article *Fisheries* in the *Encyclopædia Britannica.*

Abstract of the Total Quantity of White Herrings cured, branded for Bounty, and exported, in so far as the same have been brought under the Cognizance of the Officers of the Fishery, during the undermentioned Years, ending till 1844 on the 5th of April, since then, till 1852, on the 5th of January, and thereafter on the 31st of December, distinguishing each Year, and the Herrings cured gutted, from those cured ungutted.

Years.	Total Quantity of Herrings cured.			Total Quantity of Herrings branded.	Total Quantity of Herrings exported.		
	Gutted.	Ungutted.	Total.		Gutted.	Ungutted.	Total.

N.B. Since 1851, for Scotland and the Isle of Man only.

On looking at this Table, it is seen that the fishery made no progress under the new system till 1815, when the bounty was raised to 4*s*. This is a sufficient proof of the factitious and unnatural state of the business. Its extension, under the circumstances in question, instead of affording any proof of its being in a really flourishing condition, was distinctly the reverse. Individuals without capital, but who obtained loans sufficient to enable them to acquire boats, barrels, salt, &c. on the credit of the bounty, entered in vast numbers into the trade. The market was most commonly glutted with fish; and yet the temptation held out by the bounty caused it to be still further overloaded. Great injury was consequently done to those fish curers who possessed capital; and even the *fishermen* were injured by the system. "Most of the boats employed in the fishery never touch the water but during 6 weeks, from the middle or end of July to the middle of September. They are owned and sailed, not by regular fishermen following that vocation only, but by tradesmen, small farmers, farm-servants, and other landsmen, who may have sufficient skill to manage a boat at that season, but who do not follow the sea except for the 6 weeks of the herring fishery, when they go upon a kind of gambling speculation, of earning a twelvemonth's income by 6 weeks' work."—(*Quarterly Journal*, No. 11. p. 653.)

It has been often said, in vindication of the bounty system, that by extending the fishery it extended an important nursery for seamen; but the preceding statement shows that such has not been its effect. On the contrary, it has tended to depress the condition of the genuine fisherman, by bringing a host of interlopers into the field; and it has also been prejudicial to the little farmers and tradesmen, by withdrawing their attention from their peculiar business, that they may embark in what has hitherto been little less than a sort of lottery adventure.

These consequences and the increasing amount of the sum paid for bounties, at length induced the government to adopt a different system. By an act passed in 1825, the bounty of 2*s*. 8*d*. on exported herrings was made to cease in 1826, and 1*s*. was annually deducted from the bounty of 4*s*. a barrel paid on gutted herrings, till it ceased in 1830. And the above table shows conclusively that those who contended that the best way to promote the fishery was to let it alone, were in the right; the quantity of herrings cured and the quantity exported having been both nearly doubled since the cessation of the bounties. The fishery is now, for the first time these hundred years, placed on a secure foundation; the supply is proportioned to the real demand, while the genuine fishermen, and those curers who have capital of their own, are no longer injured by the competition of landsmen and others allured to the business by factitious encouragement and trading on capital furnished by government.

The repeal of the salt laws, and of the duty on salt, which preceded the repeal of the bounty, was of signal service to the fishery. It is true that salt used in the fisheries was exempted from the duty; but in order to prevent the revenue from being defrauded, so many regulations were enacted, and the difficulties and penalties to which the fishermen were in consequence subjected were so very great, that some of them chose rather to pay the duty upon the salt they made use of, than to undertake compliance with the regulations.

It is to be regretted, that when government repealed the bounty, it did not also abolish the "Fishery Board," and the officers and regulations it had appointed and enacted. So long as the bounty existed, it was quite proper that those who claimed it should be subjected to such regulations as government chose to enforce; but since it has been repealed, we see no reason why the fishery should not be made perfectly free, and every one allowed to prepare his herrings as he thinks best. It is said, indeed, that were there no inspection of the fish, frauds of all sorts would be practised: that the barrels would be ill made, and of a deficient size; that the fish would not be properly packed; that the bottom and middle of the barrels would be filled with bad ones, and a few good ones only placed at the top; that there would not be a sufficiency of pickle, &c. But it is obvious that the reasons alleged in vin-

dication of the official inspection kept up in the herring fishery, might be alleged in vindication of a similar inspection in almost every other branch of industry. It is, in point of fact, utterly useless. It is an attempt, on the part of government, to do that for their subjects, which they can do better for themselves. Supposing the official inspection were put an end to, the merchants and others who buy herrings of the curers would themselves inspect the barrels; and while any attempt at fraud by the curers would thus be effectually obviated, they would be left at liberty to prepare their herrings in any way that they pleased, without being compelled, as at present, to follow only one system; or to prepare fish in the same way for the tables of the poor as for those of the rich. So far, indeed, is it from being true that the inspection system tends to put down trickery, that there is much reason to think that its effect is directly the reverse. The *surveillance* exercised by the officers is anything but strict; and the official *brand* is often affixed to barrels which, were it not for the undeserved confidence that is too frequently placed in it by the unwary, would lie on the curer's hands. It is rather a security against the detection of fraud than against its existence.

The grand object of the herring fishery "Board" has been to enforce such a system of curing as would bring British herrings to a level with those of the Dutch. In this, however, they have completely failed; Dutch herrings generally fetching double the price of British herrings in every market of Europe. Neither is this to be wondered at. The consumers of Dutch herrings are the inhabitants of the Netherlands and of the German towns, who use them rather as a luxury than as an article of food, and who do not grudge the price that is necessary to have them in the finest order. The consumers of British herrings, on the other hand, are the negroes of the West Indies, and the poor of Ireland and Scotland. Cheapness is the prime requisite in the estimation of such persons; and nothing can be more entirely absurd, than that a public Board should endeavour to force the fish curers to adopt such a system in the preparation of herrings as must infallibly raise their price beyond the means of those by whom they are bought. Why should not the taste of the consumers be consulted as much in this as in anything else? It would not be more ridiculous to attempt to have all cheese made of the same richness and flavour as Stilton, than it is to attempt to bring up all herrings to the standard of the Dutch.

We do, therefore, hope that an end may be put to this system; and that our legislators and patriots will cease to torment themselves with schemes for the improvement of the fisheries. The very best thing they can do for them is to let them alone. It is not a business that requires any sort of adventitious encouragement. Every obstacle to the easy introduction of fish into London and other places should certainly be removed; but all direct interference with the fishery are sure to be in the last degree pernicious.

Of the 367,114 barrels of herrings exported from the U. Kingdom in 1857, 189,216 went to Prussia, 66,349 to Hanover, 20,224 to the Austrian territories, 19,458 to Tuscany. The exportation of herrings to the W. Indies, which had of late years rapidly declined, in consequence, no doubt, of the emancipation of the slaves, has now wholly ceased.

HIDES (Ger. *Haüte*; Du. *Huiden*; Fr. *Peaux*; It. *Cuoja*; Sp. *Pellejos, Pieles*; Rus. *Koshi*), signify, generally, the skins of beasts; but the term is more particularly applied to those of large cattle, such as bullocks, cows, horses, &c. Hides are raw or green; that is, in the state in which they are taken off the carcase, or dressed with salt, alum, and saltpetre, to prevent them from putrefying; or they are cured or tanned. The hides of South America are in the highest repute, and vast quantities of them are annually imported. The customs duty formerly imposed on hides when imported was repealed by Sir Robert Peel in 1845. And, as was to be expected, the imports have since been very largely increased. The subjoined table shows the sources whence hides are principally brought, and the supplies furnished by each.

N. B. The importation of infected or diseased hides, skins, hoofs, horns, &c., may be prohibited by Order in Council.

Account of the various Descriptions of Hides imported into the U. Kingdom in 1857, specifying the Countries whence they were imported, the Quantities brought from each, and their Values.

HOGSHEAD, a measure of capacity, containing 52½ Imperial gallons. A hogshead is equal to ½ a pipe.—(See WEIGHTS AND MEASURES.)

HOLIDAYS, are understood to be those days, exclusive of Sundays, on which no regular public business is transacted at particular public offices. They are either fixed or variable. The *variable holidays* are, Ash Wednesday, Good Friday, Easter Monday and Tuesday. Holy Thursday, Whit Monday and Tuesday.

No holidays are kept by the Bank of England, the Customs, and the Inland Revenue Department, except Christmas-day, Good Friday, the Queen's birthday, and such days as may be appointed by proclamation for the purpose of a general fast, or by warrant of the authorities.

HONEY (Du. *Honig, Honing;* Fr. *Miel;* Ger. *Honig;* It. *Mele;* Lat. *Mel;* Rus. *Med;* Sp. *Miel*), a vegetable juice collected by bees.

"Its flavour varies according to the nature of the flowers from which it is collected. Thus, the honeys of Minorca, Narbonne, and England are known by their flavours; and the honey prepared in different parts even of the same country differs. It is separated from the comb by dripping and by expression: the first method affords the purest sort; the second separates a less pure honey; and a still inferior kind is obtained by heating the comb before it is pressed. When obtained from young hives, which have not swarmed, it is denominated *virgin honey*. It is sometimes adulterated with flour, which is detected by mixing it with tepid water: the honey dissolves, while the flour remains nearly unaltered."—(*Thomson's Dispensatory.*)

HOPS (Ger. *Hopfen;* Du. *Hoppe;* Fr. *Houblon;* It. *Luppoli, Bruscandoli;* Sp. *Oblon;* Rus. *Chmel;* Lat. *Humulus Lupulus*). The hop is a perennial rooted plant, of which there are several varieties. It has an annual twining stem, which, when supported on poles, or trees, will reach the height of from 12 to 20 feet or more. It is a native of Britain, and most parts of Europe.

When the hop was first used for preserving and improving beer, or cultivated for that purpose, is not known—(see ALE); but its culture was introduced into this country from Flanders in the reign of Henry VIII. Hops are first mentioned in the Statute Book in 1552, in an act 5 & 6 Edward 6. c. 5.; and it would appear from an act passed in 1603 (1 Jac. 1. c. 18.), that hops were at that time extensively cultivated in England. Walter Blithe, in his *Improver Improved*, published in 1649 (3d ed. 1653, p. 240.), has a chapter upon improvement by plantations of hops, in which there is this striking passage. He observes, that "hops were then grown to be a national commodity; but that it was not many years since the famous city of London petitioned the parliament of England against two nuisances; and these were, Newcastle coals, in regard to their stench, &c., and hops, in regard they would *spoyl the taste of drink*, and endanger the people: and had the parliament been no wiser than they, we had been in a measure pined, and in a great measure starved; which is just answerable to the principles of those men who cry down all devices, or ingenious discoveries, as projects, and thereby stifle and choak improvement."

After the hops have been picked and dried, the brightest and finest are put into pockets or fine bagging, and the brown into coarse or heavy bagging. The former are chiefly used in the brewing of fine ales, and the latter by the porter brewers. A *pocket* of hops, if they be good in quality, well cured and tight trodden, will weigh about 1¼ cwt.; and a *bag* of hops will, under the same conditions, weigh about 2½ cwt. If the weight of either exceeds or falls much short of this medium, there is reason to suspect that the hops are of an inferior quality, or have been badly manufactured. The brighter the colour of hops, the greater is the estimation in which they are held. Farnham hops are reckoned best. The expense of forming hop plantations is very great, amounting in some instances to from 70*l.* to 100*l.* an acre; and the produce is very uncertain, the crop being frequently insufficient to defray the expenses of cultivation.

The hop growers are placed under the *surveillance* of the excise, a duty of 2*d.* per lb. being laid on all hops produced in this country. A hop planter is obliged to give notice to the excise, on or before the 1st of August each year, of the number of acres he has in cultivation; the situation and number of his oasts or kilns for drying; the place or places of bagging, which, with the storerooms or warerooms in which the packages are intended to be lodged, are entered by the officer. No hops can be removed from the rooms thus entered, before they have been weighed and marked by a revenue officer; who marks, or ought to mark, its weight, and the name and residence of the grower, upon each bag, pocket, or package. Counterfeiting the officer's mark is prohibited under a penalty of 100*l.*, and defacing it under a penalty of 20*l.* A planter or grower knowingly putting hops of different qualities or values into the same bag or package, forfeits 20*l.* And any person mixing with hops any drug, or other thing, to change or alter the colour or scent, shall forfeit 5*l.* a cwt. on all the hops so changed or altered. The malicious cutting or destroying of hop plantations may be punished by transportation beyond seas for life, or any term not less than 7 years, or by imprisonment and hard labour in a common gaol, for any term not exceeding 7 years.—(*Loudon's Ency. of Agriculture; Stevenson's Surrey; Burn's Justice, &c.*)

The duty on hops of the growth of Great Britain produced, in 1857-58, 447,035*l.* nett. The land under hops in England comprises about 52,000 acres, of which there are in Kent about 27,500, in Sussex 10,500, in Hereford, 12,500, in Worcestershire 2,000, &c.

Hops exported from Great Britain are, on being again imported, to be treated as foreign, whether originally so or not.

HORN (Du. *Hoorn;* Fr. *Corne;* Ger. *Horn;* Lat. *Cornu*), a substance too well known to require any description. Horns are of very considerable importance in the arts, being applied to a great variety of useful purposes. They are very extensively used in the manufacture of handles for knives, and in that of spoons, combs, lanterns, snuff-horns, &c. When divided into thin plates, horns are tolerably transparent, and were formerly used instead of glass in windows. Glue is sometimes made out of the refuse of horn. We annually import considerable quantities. At an average of 1850 and 1851, the imports of foreign horn amounted to 3,727 tons and the exports to 979 tons.

HORSE (Ger. *Pferd;* Du. *Paard;* Da. *Hest;* Sw. *Hast;* Fr. *Cheval;* It. *Cavallo;* Sp. *Caballo;* Rus. *Loschad;* Pol. *Kon;* Lat. *Equus;* Gr. Ἵππος), a domestic quadruped of the highest utility, being by far the most valuable acquisition made by man among the lower animals.

There is a great variety of horses in Britain; the frequent introduction of foreign breeds, and their judicious mixture, having greatly improved the native stocks. Our race horses are the fleetest in the world; our carriage and cavalry horses are amongst the handsomest and most active of those employed for these purposes; and our heavy draught horses are the most powerful, beautiful, and docile of any of the large breeds.

Number and Value of Horses in Great Britain.—The number of horses used in Great Britain for different purposes is very great, although less so, perhaps, than has been generally supposed. Mr. Middleton (*Survey of Middlesex*, 2d ed. p. 639.) estimated the total number of horses in England and Wales, employed in husbandry, at 1,200,000, and those employed for other purposes at 600,000. Dr. Colquhoun, contrary to his usual practice, reduces this estimate to 1,500,000 for Great Britain; and in this instance we are inclined to think his guess is pretty near the mark. In 1814, when the horses employed in husbandry were taxed, the numbers of the various descriptions of horses in England and Wales, which paid duty, amounted to 1,204,307. But this account did not include stage-coach, mail-coach, and hackney-

coach horses, nor did it include those used in posting. Poor persons keeping only one horse were also exempted from the duty; as were all horses employed in the regular regiments of cavalry and artillery, and in the volunteer cavalry. In Mr. Middleton's estimate, already referred to, he estimated the number of post-chaise, mail, stage, and hackney-coach horses at 100,000; and from the inquiries we have made, we are satisfied that if we estimate the number of such horses in Great Britain, at this moment, at the like sum, we shall be decidedly beyond the mark.

On the whole, therefore, it may be fairly estimated that there are in Great Britain from 1,300,000 to 1,400,000 horses employed for various purposes of pleasure and utility. They may, probably, be worth at an average from 10*l.* to 12*l.*, making their total value from 13,000,000*l.* to 16,860,000*l.* sterling, exclusive of the young horses.

The duties begin to be charged as soon as horses are used for drawing or riding, and not previously.

An Account of the Number of Horses in G. Britain charged with Assessed Duties in each of the Years ended 5th April, 1857 and 1858, and the Amount of Duty.

	1857.				1858.			
	Number of Horses.	Amount of Duty.			Number of Horses.	Amount of Duty.		
		£	s.	d.		£	s.	d.

Ditto, used by farmers, clergymen, surgeons, &c.	128,038	67,219	13	9	129,634	68,057	17	0
Ditto, exceeding 13 hands, used in trade	169,497	88,988	0	6	172,184	90,396	12	0
Ditto, not exceeding 13 hands	61,327	28,420	1	9	64,056	29,716	16	9
Total	515,739	353,328	10	0	525,000	355,253	11	9

Exemptions.—Besides the above account of the horses charged with duty, an account is published of the numbers exempted from the duty. This account is not, however, to be relied on; inasmuch as very many of those whose horses are not liable to the duties never think of making any returns. By not attending to this circumstance, we inadvertently, in a former edition of this work, under-rated the number of horses engaged in certain departments of industry.

Influence of Railroads on Horses.—The statements now made, show the dependence that ought to have been placed on the estimates that were put forth by some of the promoters of railroads and steam carriages. These gentlemen were pleased to tell us, that, by superseding the employment of horses in public conveyances, and in the regular carriage of goods, the full adoption of their projects would in the end enable 1,000,000 horses to be dispensed with; and that, as each horse consumed as much food as 8 men, subsistence for 8,000,000 human beings would be provided! To dwell upon the absurdity of such a statement would be worse than useless; nor should we have thought of noticing it, but that it found its way into a report of a committee of the House of Commons. It is sufficient to observe, that the stage and mail coaches, and public waggons, vans, &c. that have been superseded by steam carriages are not supposed to have disengaged more than from 130,000 to 140,000 horses. And the notion that 1 horse consumes as much as 8 men, at least if we suppose the men to be reasonably well fed, is too ridiculous to deserve notice.

The duties at present (1859) imposed on horses are respectively 3*l.* 17*s.* on race horses, and 1*l.* 1*s.* and 10*s.* 6*d.* on other horses. The rules for discriminating between the horses liable to the duty of 21*s.* and those liable to the smaller duty of 10*s.* 6*d.* are embodied in the act 16 & 17 Vict. c. 90. It also contains a lengthened statement of the exemptions from the duty. The latter comprise all horses kept *bonâ fide* for husbandry purposes; but such horses may be rode, free of duty, to and from any place to which a burden shall have been carried or brought back, or to procure medical assistance. Cavalry horses in H. Majesty's service are also exempted from duty; as are the horses kept by field officers, adjutants, and surgeons serving in militia regiments.

Brood mares, while kept for the sole purpose of breeding, are exempted from all duty.

The facility with which horses may be stolen has led to the enactment of several regulations with respect to their sale, &c. The property of a horse cannot be conveyed away without the express consent of the owner. Hence, a *bonâ fide* purchaser gains no property in a horse that has been stolen, unless it be bought in a *fair*, or an *open* market. It is directed that the keeper of every fair or market shall appoint a certain open place for the sale of horses, and one or more persons to take toll there, and keep the place from 10 in the forenoon till sunset. The owner's property in the horse stolen is not altered by sale in a legal fair, unless it be openly ridden, led, walked, or kept standing for *one hour at least, and has been registered*, for which the buyer is to pay 1*d.* Sellers of horses in fairs or markets must be known to the toll-takers, or to some other creditable person known to them, who declares his knowledge of them, and enters the same in a book kept by the toll-taker for the purpose. Without these formalities, the sale is void. The owner of a horse stolen may, notwithstanding its legal sale, redeem it on payment or tender of the price any time within 6 months of the time of the theft.—(*Burn's Justice of the Peace, Chitty's* ed. vol. iii. p. 264.)

In order to obviate the facility afforded by means of slaughtering houses for the disposal of stolen horses, it was enacted in 1786 (26 Geo. 3. c. 71.), that all persons keeping places for slaughtering horses, geldings, sheep, hogs, or other cattle not killed for butcher's meat shall obtain a licence from the quarter sessions, first producing from the minister and churchwardens or from the minister and 2 substantial householders, a certificate of their fitness to be intrusted with the

management and carrying on of such business. Persons slaughtering horses or cattle without licence are guilty of felony, and may be whipped and imprisoned, or transported. Persons licensed are bound to affix over the door or gate of the place where their business is carried on, in legible characters, the words "*Licensed for slaughtering Horses, pursuant to an Act passed in the 26th Year of his Majesty King Geo. III.*" The parishioners entitled to meet in vestry are authorised to choose annually, or oftener, inspectors, whose duty it is to take an account and description, &c. of every living horse, &c. that may be brought to such slaughtering houses to be killed, and of every dead horse that may be brought to be flayed. Persons bringing cattle are to be asked an account of themselves, and if it be not deemed satisfactory, they may be carried before a justice. This act does not extend to curriers, fellmongers, tanners, or persons killing aged or distempered cattle, for the purpose of using or curing their hides in their respective businesses; but these, or any other persons who shall knowingly or wilfully kill any sound or useful horse, &c., shall for every such offence forfeit not more 20*l*., and not less than 10*l*.

The stealing of horses and other cattle is a capital crime, punishable by death. The maliciously wounding, maiming, killing, &c. of horses and other cattle, is to be punished, at the discretion of the court, by transportation beyond seas for life, for any term not less than 7 years, or by imprisonment for any term not exceeding 4 years; and if a male, he may be once, twice, or thrice publicly or privately whipped, should the court so direct.—(7 & 8 *Geo.* 4. c. 29. § 25. ; 7 & 8 *Geo.* 4. c. 30. § 16.)

French Trade in Horses.—The horses of France are not, speaking generally, nearly so handsome, fleet, or powerful as those of England. Latterly, however, the French have been making great efforts to improve the breed of horses, and have, in this view, been making large importations from England and other countries. At an average of the 5 years ending with 1827, the excess of horses imported into France, above those exported, amounted to about 15,000 a year.—(*Bulletin des Sciences Géographiques*, tom. xix. p. 5.) The imports from England have, in some late years, amounted to nearly 2,000 horses. In 1853 they were 1,216.

HORSE DEALERS, persons whose business it is to buy and sell horses.

Every person carrying on the business of a horse dealer is required to keep a book, in which he shall enter an account of the number of horses kept by him for sale and for use, specifying the duties to which the same are respectively liable; this book is to be open, at all reasonable times, to the inspection of the officers; and a true copy of the same is to be delivered quarterly to the assessor or assessors of the parish in which the party resides. Penalty for non-compliance, 50*l*.—(43 *Geo.* 3. c. 161.) Horse dealers are assessed, if they carry on their business in the metropolis, 25*l*.; and if elsewhere, 12*l*. 10*s*.

In 1851 there were in the metropolis 61 horse-dealers, and in other parts of Great Britain 742, making a total of 803.

HUNDRED WEIGHT, a weight of 112 lbs. avoirdupois, generally written cwt.

I. AND J.

ICE. — The sale of ice and snow preserved in the caverns of Vesuvius and on the more elevated parts of Ætna, has long been a considerable branch of trade in Naples, Catania, and the adjoining towns; but it was reserved for the Americans to carry the trade in ice to an extent which could not previously have been anticipated. The extreme heat of the summer in the Central and Southern States occasions a natural demand for ice, which the extreme cold of the winter in the New England States gives the means of supplying. The fresh water lakes adjoining Boston and other large towns being deeply frozen in winter, large ice-houses are filled with the ice taken from them, which is retailed in summer at a low price.

This practice had not, however, been long established till it occurred to some ingenious speculators to attempt to realise a profit by shipping ice to the southern parts of the Union and the West Indies: and the speculation having succeeded, the trade was subsequently extended to the Spanish Main and South America, and more recently to Europe, India, and China! The business has, in fact, become of the first importance; numerous companies and a very large amount of tonnage being now engaged in the ice trade from Boston. And owing to the greater skill and economy with which the business is at present conducted, the ice which used a few years ago to cost 6 cents per lb. in New Orleans and the Havannah, may now be had for 1 cent; and there has been a like fall in its price in India and other more distant places. An immense warehouse has recently been constructed at Calcutta for the reception of the ice brought by the ships, whence it is supplied in the quantities required for the public accommodation. This singular fabric has triple walls, five distinct roofs, incloses about three-fourths of an acre, and is fitted to hold upwards of 30,000 tons of ice! Our readers do not require to be told that in some late years London has been a considerable market for American ice. This, however, is only a casual occurrence, depending principally on the circumstance of an unusually hot summer having followed an unusually mild winter, which, on the one hand, occasions a large demand for ice, while, on the other, it lessens or annihilates the home supply. And the same may be said generally in regard to the demand of other European countries. The ice shipped from America is principally obtained from Fresh Pond, Spy Pond, and Wenham Pond, in an elevated position, about 18 miles from Boston, to which it is conveyed by railway; but it is also obtained from various other ponds and lakes. It is kept stored up in large warehouses adjoining the lakes till it is required for shipment. The holds of the ships used for the conveyance of ice have a space between the planking of the ship and the ice boxed in and usually filled with sawdust or some other substance reckoned a non-conductor of heat. Formerly the ice was packed with straw and hay, in boxes of thin lumber made air-tight; but this mode of packing is now comparatively little used. The ice is beautifully transparent and free from air cells, and is usually cut into blocks about a foot thick. In 1854 no fewer than 156,540 tons were shipped from Boston, and about 20,000 tons from N. York. The home consumption of the latter is estimated at from 260,000 to 270,000 tons!—(*Hunt's Merchants' Magazine for August*, 1855.) (See BOSTON.)

Owing to the mildness of our winters we have sometimes little or no frost, and when it is most severe, ice in this country rarely exceeds 2 or 4 inches in thickness; and is usually, also, a good deal stained with impurities. Occasionally a supply of ice is brought from Norway, but it wants the solidity and transparency of the American ice.

JALAP, OR JALOP (Ger. *Jalapp*; Fr. *Jalap*; It. *Sciarappa*; Sp. *Jalapa*), the root of a sort of convolvulus, so named from Xalapa, in Mexico, whence we chiefly import it. The root, when brought to this country, is in thin transverse slices, solid, hard, weighty, of a blackish colour on the outside, and internally of a dark grey, with black circular striæ. The hardest and darkest coloured is the best; that which is light, spongy, and pale coloured, should be rejected. The odour of jalap, especially when in powder, is very characteristic. Its taste is exceedingly nauseous, accompanied by a sweetish bitterness.—(*Lewis's Mat. Med.*; *Brande's Pharmacy.*) The imports of jalap amounted, in 1853, to 82,345 lbs.

JAMAICA PEPPER. See PIMENTO.

JAPANNED WARES (Ger. *Japanische ware*; Du. *Japansch lakwerk*; Fr. *Marchandises de Japon*), articles of every description, such as tea-trays, clock-dials, candlesticks, snuff-boxes, &c. covered with coats of japan, whether plain, or embellished with

painting or gilding. Birmingham is the grand staple of this manufacture, which is there carried on to a great extent. Pontypool, in Monmouthshire, was formerly famous for japanning; but it is at present continued there on a very small scale only. It is prosecuted with spirit and success at Bilston and Wolverhampton.

JASPER (Ger. *Jaspiss*; Du. *Jaspis*; Fr. *Jaspe*; It. *Diaspro*; Sp. *Jaspe*; Rus. *Jaschma*). This stone is an ingredient in the composition of many mountains. It occurs usually in large amorphous masses, sometimes in round or angular pieces; its fracture is conchoidal; specific gravity from 2 to 27. Its colours are various: when heated it does not decrepitate: it is usually divided into 4 species, denominated Egyptian jasper, striped jasper, porcelain jasper, and common jasper. It is sometimes employed by jewellers in the formation of seals.

JERSEY. See GUERNSEY.

JET, OR PITCH COAL (Du. *Git, Zwarte barnsteen*; Fr. *Jais, Jayet*; Ger. *Gagat*; It. *Gagata, Lustrino*; Lat. *Gagus, Gagates*), of a black velvet colour, occurs massive, in plates; sometimes in the shape of branches of trees, but without a regular woody texture. Internal lustre shining, resinous, soft; rather brittle; easily frangible: specific gravity 1·3. It is used for fuel, and for making vessels and snuff-boxes. In Prussia it is called black amber, and is cut into rosaries and necklaces. It is distinguished by its brilliancy and conchoidal fracture. — (*Thomson's Chemistry.*)

JETSAM. See FLOTSAM.

IMPORTATION AND EXPORTATION, the bringing of commodities from and sending them to other countries. A very large portion of the revenue of Great Britain being derived from customs duties, or from duties on commodities imported from abroad; and drawbacks being given on many, and bounties on a few articles exported; the business of importation and exportation is subjected to various regulations which must be carefully observed by those who would avoid incurring penalties, and subjecting their property to confiscation. The regulations referred to are embodied in the Customs Consolidation Act, 16 & 17 Vict. c. 107., which came into operation on the 20th August, 1853. We subjoin an abstract of such portions of this statute as relate to importation, exportation, &c.

CUSTOMS CONSOLIDATION ACT OF 1853, THE 16 & 17 VICT. CAP. 107.

The first 8 clauses of the Act relate *to the appointment of Officers of Customs*, and need not be here referred to.

Clauses 9 to 14 relate *to the appointment of Ports, Quays, Warehouses, Sufferance Wharfs, Landing and Bounding Stations.*

Clauses 15 to 17 relate *to the licensing of Agents for the transacting of business relating to the Entry and Clearance of Ships, Goods, and Baggage, and of Lightermen for the carriage of goods to and from importing and exporting ships.*

Clauses 18 to 28 relate *to the Collection, Management, and Custody of Duties of Customs, and the Payment of Drawbacks and Allowances*

AS TO DISPUTES AND CONTROVERSIES BETWEEN THE IMPORTER OF GOODS AND THE OFFICERS OF CUSTOMS AS TO THE DUTY DUE ON SUCH GOODS.

In case of Dispute, Importer to deposit the Duty demanded. — If any dispute shall arise as to the proper rate of duty payable in respect of any goods imported into the U. K., and admissible for home consumption, the importer or consignee, or his agent, shall deposit in the hands of the collector of the customs at the port of importation the amount of duty demanded by such collector; and such deposit shall be deemed and taken to be the proper duty payable in respect of such goods, unless an action or suit shall be brought or commenced by the importer of such goods within 3 months from the time of making such deposit, in one of H. Majesty's courts of law at Westminster, Dublin or Edinburgh, against such collector, for the purpose of ascertaining whether any and what amount of duty is due and payable upon such goods; and, upon payment of such deposit, and passing a proper entry for such goods, by the importer, consignee, or agent, such collector shall thereupon cause the said goods to be delivered in virtue of such entry.— § 29.

Deposits to be carried to Consolidated Fund. — Where such deposit shall have been made as aforesaid the same shall be paid by the said collector to the Receiver General of Customs, to be by him carried to the Consolidated Fund of the U. K.; and in case no action shall be brought within the time hereinbefore limited for that purpose, such deposit shall be retained and applied to the use of H. Majesty, in the same manner as if the same had been originally paid and received as the duty due and payable on such goods; and in case such action shall be so brought, and it shall thereupon be determined by due course of law that the duty so demanded and deposited was not the proper duty due and payable upon such goods, but that a less duty was payable thereon, then the difference between the sum so deposited and the duty so found to be due, or the whole sum so deposited, as the case may require, shall forthwith be returned to such importer, with interest thereon after the rate of 5 per cent. per annum for the period during which the sums so paid or returned shall have been so deposited; and such payment shall be accepted by such importer in satisfaction of all claims in respect of the importation of such goods and the duty payable thereon, and of all or any damages and expenses incident thereto, except costs of suit, as next herein-after provided; that is to say, provided always, that the party to such action or suit in whose favour a verdict shall be given shall be entitled to his costs of suit as between party and party against the other party to such action or suit—such costs to be taxed by the proper officer of the court in which such action shall be brought, in the usual way; and if such verdict shall be given against the plaintiff in such action or suit, the costs so taxed as aforesaid shall be recoverable and recovered against the plaintiff in the same manner as damages and costs in an ordinary action or suit in such court are recoverable by law: but if such verdict shall be given against the collector as defendant in such suit, the costs so taxed as aforesaid shall be paid by the Commissioners of Customs out of any monies arising from the duties of customs. — § 30.

AS TO COMPLAINTS AND DISPUTES BETWEEN MERCHANTS AND OTHERS AND THE OFFICERS OF CUSTOMS, THE PUBLIC INVESTIGATION THEREOF, AND INQUIRIES TOUCHING MATTERS RELATING TO THE CUSTOMS, AND THE CONDUCT OF OFFICERS OR OTHERS CONCERNED THEREIN.

Disputes and Inquiries in London. — If in the port of London any dispute arise between any masters or owners of ships, merchants, importers, consignees, shippers, or exporters of goods, or their agents, or licensed agents, and any officer of customs, with reference to the seizure or detention of any ship or goods, or to any apparently accidental omission, inadvertence, or noncompliance with the laws or regulations relating to the customs, or touching the withdrawal of agents' licences, it shall be lawful for the Commissioners to dispose of or determine such dispute in such manner as they may deem just. — § 31.

Power to remit or mitigate Penalties. — If upon consideration of the facts and circumstances out of which such dispute shall have arisen the Commissioners of Customs shall be of opinion that any penalty or forfeiture has been incurred by any such master, owner, merchant, importer, consignee, shipper, exporter, or agent, the said Commissioners may, in case they shall be of opinion that the penalty ought to be remitted, remit and forego the same accordingly, or in case they shall be of opinion that a mitigated penalty should be imposed and enforced, mitigate any such penalty or forfeiture to such amount as they may deem a sufficient satisfaction for the breach of law or regulation complained of. — § 32.

Appeal to open Court. — In case any such master, owner, merchant, importer, shipper, exporter, or agent shall feel himself aggrieved by the determination of the Commissioners of Customs in any of the cases aforesaid, or have any ground of complaint against any officer of customs in respect of anything done or omitted to be done by such officer in or about the execution of his duty, the party so feeling himself aggrieved shall, upon an application in writing to the Commissioners of Customs, which application shall state the substance of his complaint, or the reasons of his dissatisfaction with such determination, be entitled to have the facts and circumstances of such complaint or determination inquired into by one of the said Commissioners, in the manner following : — § 33.

Commissioner to conduct public Inquiry. — Upon receipt of such application as aforesaid the Commissioners of Customs shall depute one of such Commissioners to inquire into the subject matter of such application, for which purpose a suitable apartment shall be provided, to which the parties complaining and the parties complained against, and their agents and witnesses, and all other persons interested or desirous of attending, shall have free access ; and the Commissioner so deputed shall receive the statement of the complainant or his agent or attorney, and hear any reasons which he or they may advance in support of his complaint, and the said Commissioner shall take or cause to be taken any evidence on oath which the said complainant may offer and adduce in support of his complaint, and write down or cause to be written down and report the substance of such evidence in a narrative form, and his opinion thereon and on the arguments, if any, adduced on the hearing of the case, for the information of the said Commissioners ; and in like manner the Commissioner so deputed as aforesaid shall take and write down or cause to be taken down and written, and report, for the information of the said Commissioners of Customs, any evidence which may be offered in support of such determination of the Commissioners, or in case of a complaint against an officer such exculpatory evidence as the officer complained against may offer or adduce ; and the course of proceeding with respect to the taking of such evidence and the conduct of such inquiry shall be in as close conformity as the nature of such inquiry will admit with the practices adopted before Justices on inquiries had before such Justices. — § 34.

Commissioners to prosecute or decide. — The Commissioners of Customs, upon the evidence so reported to them, shall either determine to prosecute, if they deem it a proper case for prosecution, or decide the case upon such evidence, and make their order thereon accordingly, which order shall be communicated by a Commissioner in open court either on the same day or a future day to be appointed at the hearing for that purpose ; and every order of the Commissioners of Customs, made upon consideration of the facts, circumstances, and evidence so reported by the Commissioner by whom such inquiry shall have been holden, shall, in case any penalty or mitigated penalty or forfeiture shall be adjudged by such order to be paid or enforced, be of equal force, validity, and effect as any conviction for penalties which any Justice or Justices is or are now empowered by law to make, and upon the production of any such order of any two or more of the Commissioners of Customs to any Justice or Justices of the Peace it shall be lawful for such Justice or Justices to enforce such order, in the same manner and by the like authority as such Justice or Justices is or was now empowered to enforce orders under the act 11 & 12 Vict. cap. 43., unless the party against whom such order have been made shall, within one week after the same shall have been communicated as aforesaid, give notice in writing to the Commissioners of Customs or to their solicitor that he refuses to abide by such order, in which case the Commissioners of Customs may direct such proceedings thereon as they may see fit, or the party against whom such order has been made shall have the same remedy by action in any court having jurisdiction, including the "Court of Requests of the City of London and the Liberties thereof," as if no such hearing or order had been made : provided always, that if any such master, owner, importer, shipper, exporter, or agent (not wishing to resort to such appeal as herein-before provided) be desirous of stating his case personally to one of the Commissioners of Customs, he shall be at liberty to do so on attending at the custom house during the sitting of the board on applying for that purpose. — § 35.

Power to keep Order. — The Commissioners of Customs deputed to inquire as aforesaid shall have and exercise, while engaged in the conduct of such inquiry, and to as full an extent as the same is now exercised by any Justice or Justices in Sessions, all necessary powers and authority to enforce order and propriety of conduct. — § 36.

Disputes and Inquiries at Outports. — If at any of the outports any dispute shall arise between any master or owners of ships, merchants, importers, consignees, shippers, or exporters of goods, or their agent or agents, and any officer of customs, with reference to the class of cases herein-before enumerated as arising or occurring in the port of London, the like inquiry shall be holden, the like course of proceeding adopted, the like mode of taking evidence pursued, the like accommodation for the parties concerned provided, the like authorities for maintaining order given, and, as nearly as may be, the like matters in every respect done, as herein provided for inquiry into and conduct of similar proceedings in the port of London, save and except that the duty prescribed to be performed by one of the Commissioners of Customs deputed for that purpose shall be performed at such outports by the collector or comptroller or other officer of customs deputed for that purpose. — § 37.

Inquiries and Examinations may be conducted by Commissioners, Surveyors General, &c. — In any of the foregoing cases, or whenever it shall be necessary for the Commissioners of Customs or their officers to institute any inquiry to ascertain the truth or facts with respect to any complaint or matter relating to any business under their management or control or incident thereto, or the conduct of officers or persons employed therein, such inquiries shall and may be made or conducted by the Commissioners for the time being, or any one or more of them, or by any Surveyor General, Inspector General, Collector, or Comptroller, or other officer of the Customs, or by such person or persons as the Commissioners of Customs shall direct and appoint for that purpose ; and when upon any such inquiry proof on oath shall be required by the person so conducting the same, such person shall and may administer such oath to any person attending before him as aforesaid ; and if any person so examined as a witness before such person shall be convicted of giving false evidence on his examination on oath before the person conducting such inquiry, every such person so convicted shall be deemed guilty of perjury, and shall be liable to the pains and penalties thereof. — § 38.

Power to summon Witnesses. — Upon any such inquiry or examination it shall be lawful for the Commissioners of Customs, or any one or more of them, or for any such Surveyor General, Inspector General, Collector, Comptroller, or other officer of the Customs, or person so authorised or directed by the Commissioners of Customs to conduct such inquiry or examination, to summon any person required as a witness to appear before the said Commissioners, Inspector General, Collector, Comptroller, Surveyor General, or other officer, or person authorised to conduct such inquiry or examination, as the case may be, to attend on the hearing thereof at the time and place to be specified in such summons, to give evidence upon oath of the truth of any facts appertaining to such inquiry, or any other matter touching or relating thereto; and every person so summoned, having his reasonable expenses for such attendance, if required, tendered to him at the time of service of such summons, who shall neglect or refuse to appear according to the exigency thereof, or who, having so appeared, shall refuse to take the oath, or shall refuse to give evidence, or to answer according to the best of his knowledge and belief any question when thereunto required, shall for every such default or offence forfeit the sum of 20*l.* — § 39.

Regulations for Conduct of Inquiries. —The Commissioners of Customs shall from time to time make such rules and orders for the proper conduct of such inquiries as aforesaid as may be expedient, and as in their judgment shall be necessary or proper: and such rules and orders shall be observed on the conduct of such inquiries, until annulled or varied by the authority of the said Commissioners. — § 40.

As to the Importation, or Prohibition, Entry, Examination, Landing, and Warehousing of Goods.

Importation and Prohibition. — It shall be lawful to import into the U. K. any goods which are not by this or any law in force at the time of importation thereof prohibited to be so imported, and to warehouse under the laws in force for the warehousing of goods, except as herein-after provided, in warehouses duly approved for the warehousing of goods without payment of duty on the first entry thereof, any goods subject to duties or customs the importation and warehousing whereof is not prohibited by any law in force at the time of such importation: provided always, that the duties on the following goods, and on such other goods as the Commissioners of the Treasury may from time to time direct, shall be paid on the first importation thereof, and such goods shall not be warehoused either for home consumption or exportation; viz., corn, grain, meal, and flour, and wood goods from British possessions. — § 41.

Time of Importation of Goods and Time of Arrival of Ships defined. — If, upon the first levying or repealing of any duty, or the first permitting or prohibiting of any importation, or at any other time, or for any of the purposes of this or any act relating to the customs, it shall become necessary to determine the precise time at which an importation of any goods shall be deemed to have had effect, such time shall be deemed to be the time at which the ship importing such goods had actually come within the limits of the port at which such ship shall in due course be reported and such goods be discharged; and if any question arise upon the arrival of any ship in respect of any charge or allowance upon such ship, exclusive of cargo, the time of such arrival shall be deemed to be the time to which the report of such ship has been or ought to have been made. — § 42.

Importation Direct. — No goods shall be deemed to be imported from any particular place unless they be imported direct from such place, and shall have been there laden on board the importing ship, either as the first shipment of such goods, or after the same shall have been actually landed at such place. — § 43.

Prohibitions and Restrictions. — If any goods enumerated or described in the following table of prohibitions and restrictions as "goods absolutely prohibited to be imported," shall be imported or brought into the U. K., or if any goods enumerated or described in such table as "goods prohibited to be imported except in transit, and "subject to such regulations and restrictions as the Commissioners of the Treasury may direct, and duly reported as goods in transit accordingly" shall be imported into the U. K., except in transit, in accordance with such regulations and restrictions, and so reported as aforesaid, or if any goods enumerated or described in such table as "goods subject to certain restrictions on importation" shall be imported or brought into the U. K. contrary to the prohibitions or restrictions contained in such table in respect thereof, then and in every such case such goods shall be forfeited, and shall be destroyed or otherwise disposed of as the Commissioners of Customs may direct. — § 44.

A TABLE OF PROHIBITIONS AND RESTRICTIONS INWARDS.

Goods absolutely prohibited to be imported.

Books wherein the copyright shall be first subsisting, first composed or written or printed in the U. Kingdom, and printed or reprinted in any other country, as to which the proprietor of such copyright or his agent shall have given to the Commissioners of Customs a notice that such copyright subsists, such notice also stating when such copyright will expire.

Coin, viz.—false money, or counterfeit sterling.

Coin, silver, of the realm, or any money purporting to be such, not being of the established standard in weight or fineness.

Extracts, essences, or other concentrations of coffee, chicory, tea, or tobacco, or any admixture of the same.

Malt.

Indecent or obscene prints, paintings, books, cards, lithographic or other engravings, or any other indecent or obscene articles.

Snuff work.

Tobacco stalks stripped from the leaf, whether manufactured or not.

Tobacco stalk flour.

Goods prohibited to be imported except in transit, and subject to such Regulations and Restrictions as the Commissioners of the Treasury may direct, and duly reported as goods in Transit accordingly.

Articles of foreign manufacture and any packages of such articles bearing any names, brands, or marks being or purporting to be the names, brands, or marks of manufacturers resident in the U. K.

Clocks and watches of any metal impressed with any mark or stamp appearing to be or to represent any legal British assay, mark, or stamp, or purporting by any mark or appearance to be of the manufacture of the U. K.

Parts of articles; viz., any distinct or separate part of any article not accompanied by the other part or all the other parts of such article, so as to be complete and perfect, if such article be subject to duty according to the value thereof.

Goods prohibited to be imported, except subject to the Restrictions on Importation herein contained.

Infected cattle, sheep, or other animals, and hides, skins, horns, hoofs, or any other part of cattle or other animals, which H. Majesty may, by order in council, prohibit in order to prevent any contagious distemper.

Silk, manufactures of silk, being the manufactures of Europe, unless into the ports of London, Liverpool, Hull, Southampton, Leith, or Dublin, or ports appointed by the Commissioners of Customs, or into the ports of Dover or Folkeston direct from Calais or Boulogne, and unless in ships of 50 tons burden or upwards.

Spirits (not being perfumed or medicinal spirits), unless in ships of 50 tons burden at least, and in casks or other vessels capable of containing liquids, each of such casks or other vessels being of the size or content of 20 gallons at the least, and duly reported, or in glass bottles or stone bottles not exceeding the size of 5-pint bottles, and being really part of the cargo of the importing ship, and duly reported.

Tobacco and snuff from the East Indies, and tobacco from the Turkish dominions, including Egypt, unless imported direct from any of those places in packages containing not less than 100 lbs. net weight each.

Negrohead tobacco, and also snuff being the produce of the U. States of America, unless in hhds., casks, chests, or cases, containing not less than 200 lbs. net weight each, or unless imported direct from the said U. States in packages containing not less than 150 lbs. net weight each.

Tobacco from Malta, and tobacco the produce of Porto Rico, Mexico, South America, St. Domingo, Cuba, the British possessions in America, and the W. coast of Africa, unless in hhds., casks, chests, or cases containing not less than 200 lbs. net weight each, or unless imported direct from those places, or from the U. States of America in packages containing not less than 80 lbs. net weight each.

Tobacco and snuff, the produce of the Philippine Islands, unless in hhds. casks, chests, or cases containing not less than 200 lbs. net weight each, or unless such tobacco or snuff be imported from Manilla direct, in bales or packages containing not less than 200 lbs. net weight each.

Tobacco and snuff of or from any other country or place not before enumerated, unless in hhds., casks, chests, or cases, containing not less than 200 lbs. net weight each.

Cigars, unless in packages containing not less than 100 lbs. net weight each.

Cigarillos or cigarettos, unless in packages containing not less than 75 lbs. net weight each.

Tobacco, not being cigars, cigarillos, or cigarettos and snuff, separated or divided in any manner within any package in which the same may by the foregoing Table be imported, except tobacco from the Turkish empire, or from Egypt, in outer packages containing not less than 100 lbs. net weight each.

Tobacco, snuff, cigars, cigarillos, or cigarettos of any kind, or from any country or place whatever, unless in ships of not less than 120 tons burden, and imported into such ports only as are or may be approved of by the Commissioners of Customs.

Arms, &c. may be prohibited — The importation of arms, ammunition, gunpowder, or any other goods may be prohibited by proclamation or order in council. — § 45.

Printed Lists of prohibited Books to be exposed at Custom Houses.—The Commissioners of Customs shall cause to be made, and to be publicly exposed at the several ports in the U. K. and in H. Majesty's possessions abroad, printed lists of all books wherein the copyright shall be subsisting, and as to which the proprietor of such copyright, or his agent, shall have given notice in writing to the said Commissioners that such copyright exists, stating in such notice when such copyright expires. — § 46.

Ship to come quickly to Place of unlading, and bring to at the Stations for boarding Officers. — If any ship coming into the U. K. or into the Channel Islands shall not come as quickly up to the proper place of mooring or unlading as the nature of the port will admit, without touching at any other place, and in proceeding to such proper place shall not bring to at the stations appointed by the Commissioners of Customs for the boarding of ships by the officers of the Customs, or, if after arrival at such place such ship shall remove from such place, except directly to some other proper place of mooring or unlading, and with the knowledge of the proper officer of the Customs, or if the master of any ship on board of which any officer is stationed neglect or refuse to provide every such officer sufficient room under the deck in some part of the forecastle or steerage for his bed or hammock, the master of such vessel shall forfeit the sum of 20*l.* — § 47.

Officers to board Ships, &c.— The proper officers of the Customs may board any ship arriving at any port in the U. K. or the Channel Islands, and freely stay on board until all the goods laden therein shall be duly delivered from the same, and shall have free access to every part of the ship, with power to fasten down hatchways or entrances to the hold, and to mark any goods before landing, and to lock up, seal, mark, or otherwise secure any goods on board such ship; and if any place or any box or chest be locked, and the keys be withheld, such officers, if they be of a degree superior to that of tidewaiter, may open any such place, box, or chest in the best manner in their power, and if they be tidewaiters, or only of that degree, they shall send for their superior officer, who may open or cause to be opened any such place, box, or chest in the best manner in his power; and if any goods be found concealed on board any such ship they shall be forfeited; and if the officers shall place any lock, mark, or seal upon any goods on board, and such lock, mark, or seal be wilfully opened, altered, or broken before due delivery of such goods, or if any of such goods be secretly conveyed away, or the hatchways or entrances to the hold, after having been fastened down by the officer, be opened, the master of such ship shall forfeit the sum of 100*l.*; and if the proper officer of the customs shall place any lock, mark, or seal upon any stores on board any ship or vessel arriving in the U. K., and such lock, mark, or seal be wilfully opened, altered, or broken, or if any such stores be secretly conveyed away, either while the ship remains in the port at which she shall have so arrived, or before she shall have arrived at any other port in the U. K. to which she may then be about to proceed, the master of such ship shall forfeit the sum of 20*l.* — § 41.

Time and Place of landing Goods Inwards.—No goods, except diamonds, bullion, lobsters, and fresh fish of British-taking and imported in British ships, which may be landed without report or entry, shall be unshipped from any ship arriving from parts beyond the seas, or be landed or put on shore, on Sundays or holidays, nor shall they be so unshipped, landed, or put on shore on any other days, except between the hours of 8 o'clock in the morning and 4 o'clock in the afternoon from the 1st of March until the 1st of November, and between the hours of 9 o'clock in the morning and 4 o'clock in the afternoon from the 1st of November until the 1st of March, or during such other hours as may be appointed by the Commissioners of Customs; nor shall any goods be unshipped or landed unless in the presence or with the authority of the proper officer of the customs, nor shall they be so landed except at some legal quay, wharf, or other place duly appointed for the landing of goods, nor shall any such goods after having been unshipped, or put into any boat or craft to be landed, be transhipped or removed into any other boat or craft previously to their being landed without the permission of the proper officer of the Customs; and if any such goods shall be unshipped, landed, transhipped, or removed contrary hereto the same shall be forfeited, and if any goods shall be unshipped or removed from any importing ship for the purpose of being landed after due entry thereof, such goods shall be forthwith removed to and landed at the wharf, quay, or other place at which the same are intended to be landed; and if such goods are not so removed and landed the same shall be forfeited, together with the barge, lighter, boat, or other vessel employed in removing the same. — § 49.

AS TO THE REPORT OF THE CARGO OF MERCHANT SHIPS, AND OF SHIPS IN COMMISSION BRINGING MERCHANDISE FROM PARTS BEYOND THE SEAS.

Master to report within Twenty-four Hours after Arrival. — The master of every ship, whether laden or in ballast, shall within twenty-four hours after arrival from parts beyond the seas at any port in the U. K., and before bulk be broken, make due report of such ship in the form following or to the same effect, and containing the several particulars indicated or required thereby; and if the cargo of such ship shall have been laden at several places shall state the names of those places in column 1. in the order of time in which the same were laden opposite to the particulars of the goods so laden. — § 50.

Port of	REPORT.					
Ship's Name.	Tonnage.	British or Foreign; if British, Port of Registry; if Foreign, Country to which she belongs.	Number of Crew.		Name of Master, and whether a British or Foreign Subject.	Port or Place from whence arrived.
			British Seamen.	Foreign Seamen.		
		Here state the Particulars according to the above Headings.

Surplus Stores remaining on board, viz. [ ]

Number of Alien Passengers (if any) -
Pilots' Names -
At what Station Ship lying -
Agent's Name and Address -

I declare that the entry above written is a just report of my ship and of her lading, and that the particulars therein inserted are true to the best of my knowledge, and that I have not broken bulk or delivered any goods out of my said ship since her departure from , the last foreign place of loading (*except, if so, at stating where.*)

(Signed) *Master.*

Signed and declared this day of

In presence of

(Countersigned) *Collr. or Contr.*

On Failure Master to forfeit 100*l.*—If such master shall wilfully fail to make such report according to the particulars here set forth, so far as the same are applicable to such ship, cargo, and voyage, or if the particulars or any of them contained in such report be false, such master shall forfeit the sum of 100*l.* — § 51.

Commissioned Ships, British or Foreign, having Goods on Board, &c. — The captain, master, purser, or other person having the charge of any ship (having commission from H. Majesty, or from any foreign state) having on board any goods laden in parts beyond the seas shall on arrival at any port in the U. K., and before any part of such goods be taken out of such ship, or when called upon so to do by any officer of the customs, deliver an account in writing under his hand to the best of his knowledge of the quality and quantity of every package or parcel of such goods, and of the marks and numbers thereon, and of the names of the respective shippers and consignees of the same, and shall make and subscribe a declaration at the foot of such account declaring to the truth thereof, and shall also truly answer to the collector or comptroller such questions concerning such goods as shall be required of him, and on failure thereof such captain, master, purser, or other person shall forfeit the sum of 100*l.*; and all such ships shall be liable to such searches as merchant ships are liable to, and the officers of the customs may freely enter and go on board all such ships, and bring from thence on shore into the Queen's warehouse any goods found on board any such ship as aforesaid, subject nevertheless to such regulations in respect of ships of war belonging to H. Majesty as shall from time to Time be directed in that respect by the Commissioners of H. Majesty's Treasury. — § 52.

Master to deliver Bills of Lading and answer Questions —The master of every ship arriving from parts beyond the seas shall at the time of making such report deliver to the collector or comptroller, if required, the *bill of lading*, or a copy thereof, for every part of the cargo laden on board, and shall answer all such questions relating to the ship, cargo, crew, and voyage as shall be put to him by such collector or comptroller; and in case of failure or refusal to answer such questions or answer truly, or to produce any such bill of lading or copy, or if any such bill of lading or copy shall be false, or if any bill of lading be uttered or produced by any master, and the goods expressed therein shall not have been *bonâ fide* shipped on board such ship, or if any bill of lading uttered or produced by any master shall not have been signed by him, or any such copy shall not have been received or made by him, previously to his leaving the place where the goods expressed in such bill of lading or copy were shipped, or if after the arrival of any ship within four leagues of the coast of the U. K. bulk shall be broken, or any alteration made in the stowage of the cargo of such ship so as to facilitate the unlading of any part of such cargo, or if any part be staved, destroyed, or thrown overboard, or any package be opened, unless accounted for to the satisfaction of the Commissioners of Customs, in every such case such master shall forfeit the sum of 100*l.* — § 53.

Packages reported "Contents unknown" may be opened and examined. — If the contents of any package intended for exportation in the same ship shall be reported by the master as being unknown to him, the officers of the Customs may open and examine such package on board, or bring the same to the Queen's warehouse for that purpose, and if there be found in such package any goods which are prohibited to be imported such goods shall be forfeited, unless the Commissioners of Customs shall permit them to be exported. — § 54.

AS TO THE ENTRY OF DUTIABLE GOODS TO BE DELIVERED FOR HOME CONSUMPTION ON THE LANDING THEREOF FROM THE IMPORTING SHIP.

Entry for Home Consumption. — The importer of any goods liable to duties of customs and intended to be delivered for home use on the landing thereof from the importing ship, or his agent, shall, before unshipment thereof, make perfect entry of such goods by delivering to the collector or comptroller a bill of entry thereof in the form following or to the same effect, and containing the several particulars indicated in or required thereby.

Dated this day of 18 .

(Signed)

Importer or Agent.

I (*name of importer or agent*), of (*place of abode*) do hereby declare that I am (*the importer or agent duly authorised by the importer*) of the goods contained in this bill of entry, and that I enter the same goods, therein stated as goods charged at value, at the sum of (*money in words at length*).

Witness my hand the day of 18

(Signed)

Importer or Agent.

And the particulars in such entry shall correspond with the particulars given of the same goods and packages in the report of the ship, and in any certificate of origin or other document, where any such is required, by which the importation or entry of such goods is authorised, or upon which the importer is entitled to any benefit by the distinction thereof, or otherwise, and whenever the value of any goods is required to be stated in the entry, the importer or his agent shall subscribe a declaration of the truth of such value in the form set forth at the foot of such entry. — § 55.

Payment of Duties. — The importer or his agent shall immediately upon the entry of any goods entered by him to be delivered for home use pay down any duties which may be payable upon the goods mentioned in such bill of entry, if in London, to the receiver general, and if at any of the outports to the collector or other person authorised by the Commissioners of Customs to receive the same; and such bill of entry, when signed by the collector or other such person, shall be transmitted to the landing waiter, and be his warrant for the landing and delivery of such goods. — § 56.

Detention of Goods for under Value. — If upon the examination of any goods entered for duty, which are chargeable with duty upon the value thereof, it shall appear to the officers of customs that such goods are not valued according to the true value thereof, or that they are properly chargeable with a higher rate or amount of duty than that to which they would be subject according to the value thereof as described in the entry, it shall be lawful for such officers to detain the same, in which case they shall forthwith give notice in writing to the person entering the same of the detention of such goods, and of the value thereof as estimated by them, either by delivering such notice personally or by transmitting the same by post to such person, addressed to him at his place of abode as stated in his entry; and the Commissioners of Customs shall, within 7 days after the detention of such goods, determine either to deliver such goods on the entry of such person, or to retain the same for the use of the crown, in which latter case they shall cause the value at which the goods were so entered, together with an addition of 5 per cent. and the duties already paid on such entry, to be paid to the person entering the same in full satisfaction for such goods, or may permit such person, on his application for that purpose, to amend such entry at such value and on such terms as they may direct; and if the Commissioners shall retain such goods they shall and may dispose of them for the benefit of the crown, and if the proceeds arising therefrom, in case of sale, shall exceed the sums so paid and all charges incurred by the crown, one moiety of such surplus shall be paid to a separate fund at the disposal of the Commissioners of Customs, and be distributed by them at such periods and in such proportions to or amongst such meritorious officers as the Commissioners of Customs shall select as most deserving, and the other moiety shall be accounted for, paid, and carried to account as duties of customs under the direction of the Commissioners of Customs. — § 57.

As to the Entry of Goods intended to be warehoused without Payment of Duty on First Entry thereof.

Entry for the Warehouse. — The importer of any goods intended to be warehoused without payment of duty on the first entry thereof, or his agent, shall deliver to the collector or comptroller a bill of entry of such goods in the same manner and form and containing the same particulars as are before required on the entry of goods to be delivered for home use on the landing thereof as far as the same shall be applicable, and the name and description of the warehouse in which such goods are intended to be warehoused, and the name of the person in whose name they are to be warehoused; and such bill of entry, when signed by the collector or comptroller, shall be transmitted to the proper officer of customs, and be the warrant for the due warehousing of such goods. — § 58.

Goods entered for Warehouse may upon further Entry be delivered for Home Use or Exportation. — If after any goods shall have been duly entered and landed to be warehoused, though not actually deposited in the warehouse, the importer shall further duly enter the same, or any part thereof, for home use or for exportation, the same may be delivered and taken for home use or exportation, as the case may be. — § 59.

As to the Entry of Goods free of Duty.

Particulars of Entry. — The importer of any goods not subject to duties or customs, or his agent, shall deliver to the collector or comptroller a bill of entry of such goods in the same manner and form and containing the same particulars as before required on the entry of dutiable goods, so far as the same is applicable, which entry, so far as regards the goods, shall be a transcript of the report, and shall therein describe such goods according to the terms upon which such goods are free of duty, and the value of such goods as shall have been previously chargeable with duty at value; and such bill of entry, when signed by the collector or comptroller, shall be transmitted to the proper officer, and be his warrant for the delivery of the goods mentioned therein; and the importer, owner, or consignee of such goods, or his agent, shall, within 14 days after the entry and landing thereof, deliver to the collector, comptroller, or other proper officer of customs a full and true account of the goods so landed; provided, that at Liverpool, and with the sanction of the Commissioners of Customs at any other port where the docks, quays, and wharfs shall in like manner be wholly or principally under the control and management of one and the same corporate body, the owner, master, or consignee of the importing ship, or his agent, shall sign and leave with the collector of customs, within 14 days next after the final discharge of such goods, a full and accurate list thereof, stating the quantities and distinguishing the weight and contents by measurement of such goods, if any, comprised therein, as shall be chargeable by weight or by measurement for the freight payable thereon, and the names of the consignees (according to the bills of lading), or the names of the persons actually paying the freight for the same; and on failure to leave such list, such owner, master, consignee, or agent shall forfeit the sum of 20*l.* — § 60.

As to the Entry of Goods landed for Examination by Bill of Sight and perfecting Entry thereof.

Entry by Bill of Sight when Goods not known. — The importer of any goods or his agent, if unable for want of full information to make a perfect entry of such goods, on making and subscribing a declaration to that effect before the collector or comptroller, may make an entry by bill of sight for the packages or parcels of such goods in the form following, or to the same effect, and containing the several particulars indicated or required thereby. — § 61.

BILL OF SIGHT.

Port of [*Name of Port of Importation*].
Importer [*Name of Importer*].

Wharf, Dock, or Station.	Ship's Name.	Whether British or Foreign; if Foreign, the Country.	Master's Name.	Port or Place from whence imported.	Name of Importer or of his Agent.
Here state the Particulars according to the above Headings					

Marks.	Numbers.	Number of Packages, with the best Description of the Goods the Importer is able to give.
Here state the Particulars according to the above Headings.		

I , the importer (or agent to the importer) of the goods above-mentioned, do hereby declare that I have not (*if importer*), or that to the best of my knowledge he has not (*if agent*), received sufficient invoice, bill of lading, or other advice from whence the quality, quantity, or value of the goods above-mentioned can be ascertained.
Dated this day of 18 .

(Signed) _____ *Importer, or his Agent.*

(Signed) *Coll. or Comptr.* _____ . § 61.

Warrant for landing. — Such entry being delivered to the collector or comptroller, and signed by him, shall be the warrant for provisionally landing such goods to be examined by such importer in the presence of the proper officers, and the importer shall within 3 days after the landing thereof, and before the same shall be delivered, make full and perfect entry thereof, by endorsing upon such bill of sight such particulars of such goods as are before required on making perfect entry of goods, whether for payment of duty, or for warehousing, or for delivery free of duty, as the case may be, and to such indorsement he shall affix the date thereof, together with his signature and place of abode, and such indorsement, when signed by the collector or comptroller, shall be taken as the perfect entry for such goods. — § 62.

Goods entered by Bill of Sight not to be delivered, unless Duty is paid or deposited. — Where an entry for the landing and examination of goods for delivery on payment of duty shall be made by bill of sight such goods shall not be delivered until perfect entry thereof have been made and the duties due thereon paid, unless the importer or his agent shall have deposited with the proper officer of the customs a sum of money sufficient in amount to cover the duties payable thereon; and if the sum deposited on a bill of sight shall not be equal in amount to the duties payable upon all the goods contained in any single package landed or examined thereby, no part shall be delivered until a perfect entry or entries is or are made, and the duties paid or deposited for the whole of the goods contained in such package. — § 63.

Goods to be taken to Queen's Warehouse in default of perfect Entry within Three Days, &c. — If full and perfect entry of any goods landed by bill of sight as aforesaid be not made within three days after the landing thereof, such goods shall be taken to the Queen's warehouse by the officers of the customs; and if the importer shall not within 1 month after such landing make perfect entry or entries of such goods, and pay the duties thereon or on such parts as can be entered for home use, together with the charges of removal and of warehouse rent, such goods shall be sold for the payment of such duties and charges (or for exportation if they be such as cannot be entered for home use or shall not be worth the duties), and the overplus, if any, after payment of such duties and charges, or the charges if sold for exportation, shall be paid to the importer or proprietor thereof: provided always, that when entry be at any time made as and for a full and perfect entry for any goods provisionally landed by bill of sight or deposited in the Queen's warehouse, as aforesaid, if such entry shall not be made in manner herein required for the due landing of the goods, the same shall be deemed to be goods landed without entry, and shall be forfeited. — § 64.

As to the Entry of Goods re-imported into the U. K. as Foreign or by Bill of Store.

Re-importation of British Goods. — All British goods re-imported into the U. K. shall be deemed and taken to be and be entered as foreign, and shall be liable to the same duties, rules, regulations, and restrictions as such goods, if foreign, would be liable to on the first importation thereof, unless the same shall be re-imported within 10 years after the exportation thereof, and it shall be proved to the satisfaction of the Commissioners of Customs that the property in such goods has continued and still remains in the person by whom or on whose account the same have been exported, in which case the same may be entered as British goods, by bill of store containing such particulars and in such form and manner as the said commissioners may direct: provided always, that the following goods shall, on re-importation be deemed and taken to be foreign goods, namely, corn, grain, meal, flour, and hops, and also all goods for which any drawbacks of excise shall have been received on exportation, unless by special permission of the Commissioners of Customs, and on repayment of such drawback, and also all goods for which a bill of store connot be issued in manner directed by the said Commissioners, except remnants of British goods, with permission of the Commissioners of Customs. — § 65.

As to Entries of Goods in any of the foregoing Cases.

Bill of Entry to be in duplicate. — Upon the entry of any goods, the importer, his agent, or consignee of the ship, as the case may be, shall deliver 2 or more duplicates of the bill of entry thereof, as the case may require, in which duplicates all sums and numbers may be expressed in figures; and the number of duplicates shall be such as the collector or comptroller may require. — § 66.

Importer or Agent failing to comply with Regulations to forfeit 20l. — Every importer, agent, or other person entering any goods who shall wilfully fail to comply with the foregoing regulations, so far as they are respectively applicable to the goods so entered by him, shall forfeit and pay the sum of 20*l*. — § 67.

No Entry valid unless Goods properly described therein. — No entry or warrant for the landing of any goods shall be deemed valid unless the goods shall be properly described in such entry by the denominations and with the characters and circumstances according to which such goods are charged with duty or may be imported, either to be used in the U. K., or to be warehoused for exportation only. — § 68.

Goods concealed in Packages or delivered without Entry forfeited. — If any package or parcel shall have been landed by or in pursuance of any entry, and any goods or other things shall be found in such package or parcel concealed in any way or packed to deceive the officers, such package or parcel and all the contents thereof shall be forfeited; and if any goods be taken or delivered out of any ship or out of any warehouse, not having been duly entered, the same shall be forfeited: provided always, that no entry shall be required in respect of the baggage of passengers, which may be examined, landed, and delivered under such regulations as the Commissioners of Customs may direct, but if any prohibited or uncustomed goods shall be found concealed therein either before or after landing, the same shall be forfeited, together with the other contents of the package containing the same. — § 69.

Surplus Stores not excessive may be entered for private Use or Warehouse. — The proper officer may permit any surplus stores, not being merchandise, nor by him deemed excessive, to be entered for private use under and subject to the same duties, rules, and regulations as the like sort of goods would be subject to on importation as merchandise, or permit the master, owner, purser, or other officer of any ship, or any passenger of such ship, to whom any surplus stores belong, to enter and warehouse such surplus stores for future use as ship's stores, although the same could not be legally imported by way of merchandise. — § 70.

Entry of Goods by Agents without License or by unauthorised Persons not permitted. — If at any port where persons acting as agents for transacting any business relating to the clearance of any ship or goods or baggage shall be required to be licensed, any person not so licensed, or not being the duly appointed clerk to any person so licensed, shall act as such agent or clerk, or if any person, whether so licensed or appointed or not, shall make or cause to be made entry of any goods without being duly authorised for that purpose by the proprietor or consignee of such goods, every such person shall for every such offence forfeit the sum of 20*l.*; but no such penalty shall extend to any person acting under the direction of the several dock companies, or to any person otherwise authorised by law to pass entries, nor to any merchant, importer, or consignee of any goods, acting himself in respect thereof, or any clerk or servant exclusively employed by him or by any such persons in copartnership. — § 71.

Agent to produce Authority if required. — Whenever any person shall make application to any officer of the customs to transact any business on behalf of any other person, such officer may require of the person so applying to produce a written authority from the person on whose behalf such application shall be made, and in default of the production of such authority refuse to transact such business. — § 72.

Officers may take Samples. — The officers of customs may on the entry of any goods, or at any time afterwards, take samples of such goods for examination, or for ascertaining the duties payable on such goods, or for such other purpose as the Commissioners of Customs may deem necessary, and such samples shall be disposed of and accounted for in such manner as the Commissioners of Customs may direct. — § 73.

As to the Time within which Goods shall be entered and landed after the Arrival of the importing Ship.

Goods not entered within 14 *Days may be conveyed to Queen's Warehouse.* — If the importer of any goods shall not, within 14 days (exclusive of Sundays and holidays), after the arrival of the ship importing the same, make perfect entry or entry by bill of sight of such goods, or if, having made such entry, he shall not land such goods within such 14 days, or within such further period as the Commissioners of Customs shall direct, the officers of the customs may convey such goods to the Queen's warehouse; and whenever the cargo of any ship shall have been discharged within such 14 days, with the exception only of a small quantity of goods, the officers of the customs may forthwith convey such remaining goods to the Queen's warehouse; and also at any time after the arrival of such ship may convey any small packages or parcels of goods therein to the Queen's warehouse, there to remain for due entry during the remainder of such 14 days; and if the duties due upon any goods so conveyed to the Queen's warehouse shall not be paid within three months afterwards, or within such further period as the said Commissioners may direct, together with all charges of removal and warehouse rent, such goods may be sold, and the produce thereof applied, first to the payment of freight and charges, next of duties, and the overplus, if any, shall be paid to the proprietor of the goods on his application for the same; but if such goods or any of them shall be of a perishable nature, the Commissioners of Customs may forthwith direct sale thereof, and apply the proceeds in like manner: provided always, that for this purpose, if the importing ship and goods be liable to the performance of quarantine, the time for entry and landing of such goods shall be computed from the time at which such ship and goods shall have been released from quarantine: provided always, that if 48 hours or any earlier period after the report of any ship is specified in the bills of lading for the discharge of her cargo or any part thereof, and the importer, owner, or consignee of such goods, or his agent shall neglect to enter and land the same within such 48 hours at any port or place approved by the Commissioners of Customs, the master or owner of such ship may immediately, on the expiration of such 48 hours, enter and land such goods. — § 74.

If Goods remain on board importing Ship beyond 14 *Days, such Ship may be detained for Expenses.* — Whenever any goods shall remain on board any importing ship beyond the period of 14 days after the arrival of such ship, or beyond such further period as the Commissioners of Customs may allow, such ship shall be detained by the proper officer of customs until all expenses of watching or guarding such goods beyond such 14 days, or such further time, if any allowed as aforesaid, not exceeding 5*s.* per diem, and of removing the goods, or any of them, to the Queen's warehouse, in case the officers shall so remove them, be paid. — § 75.

As to Goods upon which any Abatement for Damage on the Voyage or by Wreck may be claimed.

Abatement of Duty on damaged Goods. — No claim for any abatement of duty in respect of any goods imported into the U. K. shall be allowed on account of damage, unless such claim shall be made on the first examination thereof, and in such form and manner as the Commissioners of Customs shall direct, nor unless it shall be proved to the satisfaction of the Commissioners of Customs or their officers that such damage was sustained after such goods had been shipped in the importing ship and before the landing thereof in the U. K.; and all goods derelict, jetsam, flotsam, and wreck brought or coming into the U. K., and all droits of Admiralty sold in the U. K., shall at all times be subject to the same duties as goods of the like kind on importation into the same part of the U. K. are subject to, unless it shall be shown to the satisfaction of the Commissioners of Customs that such goods are the growth, produce, or manufacture of any country or place by virtue whereof the same may be entitled to be admitted at less than the foreign duty, or duty free, or that the same, if liable to duty, are entitled to an abatement in respect of such damage; and the damage sustained by such goods, whether so imported or derelict, jetsam, flotsam, or wreck as aforesaid, shall be assessed by the officers of the customs, if competent thereto, but if not, or if the Commissioners of Customs or the collector or comptroller of the port into which the same shall be imported or brought as aforesaid shall entertain any doubt as to the amount of such damage, they may call upon two indifferent merchants to examine the goods and certify to what extent in their judgment the same are lessened in value by such damage, whereupon the officers of the customs may make an abatement not exceeding $\frac{2}{3}$ths of the duty originally chargeable thereon, but no allowance shall be made for damage on coculus indicus, nux vomica, rice, guinea grains, lemons, spirits, corn, grain, meal and flour, opium, sugar, cocoa, oranges, tea, coffee, pepper, tobacco, currants, raisins, wine, and figs. — § 76.

AS TO THE PRODUCTION OF CERTIFICATES OF ORIGIN IN RESPECT OF GOODS CLAIMING ANY BENEFIT THEREBY ON IMPORTATION.

Goods from Possessions abroad. — No goods shall be entered as being of or from any British possessions abroad, (if any benefit attach to such distinction,) except the territories subject to the government of the presidencies of Bengal, Madras, and Bombay respectively, unless the master of the ship importing the same shall have delivered to the collector or comptroller a certificate, under the hand of the proper officer of the place where such goods were taken on board, of the due clearance of such ship from thence, containing an account of such goods. — § 77.

Treasury may require Certificates of Production. — The Commissioners of the Treasury may by order under their hands declare that a certificate of production shall be required upon the exportation of any goods from any British possession abroad or other place, or upon the importation of such goods into the U. K., and frame such regulations respecting such certificates and goods as they may think fit; and if any goods in respect of which such certificates are required be imported without such certificate, they shall be deemed to be foreign goods and liable to any duty attaching to them as such; and such orders of the Treasury shall be published in the London and Dublin Gazettes 3 times at least within 3 months from the date thereof respectively. — § 78.

Certificate of Growth of Sugar and Spirits from British Possessions in America and the Mauritius. — Before any spirits or sugar, so long as any benefit shall attach to the distinction, shall be entered as being of the produce of any British possession in America or the island of Mauritius, the master of the ship importing the same shall deliver to the collector or comptroller a certificate, under the hand of the proper officer of the place where such goods were taken on board, testifying that proof had been made in manner required by law that such goods are of the produce of some British possession in America or of the island of the Mauritius, stating the name of the place where such goods were produced, and the quantity and quality of the goods, and the number and denomination of the packages containing the same, and the name of the ship in which they are laden and of the master thereof. — § 79.

Certificate of Sugar from Limits of East India Company's Charter. — Before any sugar shall be entered as being the produce of any British possession within the limits of the E. I. Company's charter, the master of the ship importing the same shall, so long as any benefit attach to such distinction, deliver to the collector or comptroller a certificate under the hand and seal of the proper officer at the place where such sugar was taken on board, testifying that a declaration in writing, the contents of which he believed to be true, had been made and signed before him by the shipper of such sugar, that the same was really and *bona fide* the produce of the British possession. — § 80.

East India Sugar warehoused at the Cape of Good Hope. — If any sugar, the produce of any British possession within the limits of the E. I. Company's charter, so long as any benefit attaches to such distinction, shall have been imported into the Cape of Good Hope from the place of its production, accompanied by such a certificate of origin as would be sufficient for its admission into the U. K. at the rate of duty payable upon such sugar, if imported direct from the place of its production, and shall have been warehoused at the Cape of Good Hope under the regulations there in force for the warehousing of goods, and shall have been exported from such warehouse, accompanied by a certificate from the proper officer of customs at the Cape of Good Hope, setting forth the particulars of the importation, and of the warehousing, and of the exportation of the same, and also setting forth the substance of the certificate of origin before mentioned, and if on the arrival in the U. K. of the ship importing such sugar, the master of such ship shall deliver to the collector or comptroller at the port of importation such certificate from the officer of the customs at the Cape of Good Hope, such sugar shall be admitted at such port of importation in the U. K. at the same rate of duty as would be payable if the same had been imported direct from the place of its production. — § 81.

Goods of Guernsey, Jersey, &c. — Any goods of the growth of the Channel Islands, and any goods manufactured in the said islands from materials of their growth, or from materials not subject to duty in the U. K., or from materials upon which the duty has been paid in the U. K., and upon which no drawback has subsequently been granted, may be imported into the U. K. from the said islands respectively without payment of any duty, and such goods shall not be deemed to be included in any charge of duties imposed by any act on the importation of goods generally from parts beyond the seas: but such goods shall be charged with any proportion of such duties as shall fairly countervail any duties of excise payable on the like goods the produce or manufacture of the part of the U. K. into which they shall be imported, or payable upon any of the materials from which such goods are manufactured; and all goods manufactured in any of the said islands from any other materials than the materials aforesaid shall be declared and taken to be foreign goods. — § 82.

Master to deliver Certificate of Produce. — Before any goods shall be entered as being the produce of the said islands, (if any benefit attach to such distinction,) the master of the ship importing the same shall deliver to the collector or comptroller of customs a certificate from the governor, lieutenant-governor, or commander-in-chief of the island from whence such goods were imported, that proof had been made in manner required by law that such goods were of the produce of such island, stating the quantity and quality of the goods, and the number and denomination of the packages containing the same. — § 83.

Certificate of Wine from British Possessions. — Before any wine shall be entered as being the produce of any of the British possessions abroad, the master of the ship importing the same shall deliver to the collector or comptroller a certificate under the hand of the proper officer of such possession, testifying that proof had been made in manner required by law that such wine is the produce of such possession, stating the quantity and sort of such wine, and the number and denomination of the packages containing the same. — § 84.

AS TO THE UNSHIPPING, LANDING, EXAMINATION, WAREHOUSING, AND CUSTODY OF GOODS.

Goods to be unshipped, carried, landed, weighed, &c., and deposited at the Expense of the Importer. — The unshipping, carrying, and landing of all goods, and bringing them to the proper place for examination, and weighing, putting them into the scales, opening, unpacking, repacking, bulking, sorting, lotting, marking, and numbering, where such operations respectively are necessary or permitted, and removing to and placing them in the proper place of deposit until duly delivered, shall be performed by or at the expense of the importer: and the importer or person entering any timber or wood to be charged with duty by measurement shall, at his expense, pile, sort, frame, or otherwise place the same in such manner as the Commissioners of Customs may deem necessary to enable the officers to measure and take the account thereof; and in all cases when the same is measured in bulk, the measurement shall be taken to the full extent of the pile, and no allowance shall be made by the officers on account of any interstices; but battens, boards, deals, and planks exceeding 21 feet in length may be measured by the piece, and the account thereof taken separately. — § 85.

Goods removed or carried into the Warehouse without Authority, forfeited. — If any goods shall be removed from any ship, quay, wharf, or other place previous to the examination thereof by the proper officer of customs, unless under the care or authority of such officer, or if any goods entered to be warehoused, or to be re-warehoused, shall be carried into the warehouse, unless with the authority or under the care of the proper officer of customs, and in such manner, by such persons, within such time, and by such roads or ways as such officer shall direct, such goods shall be forfeited. — § 86.

Landing Waiter to take Account of Goods for Warehouse. — Upon the entry and landing of any goods to be warehoused, or within such period as the Commissioners of Customs shall direct with respect to the same or any of them, the landing waiter or other officer of customs shall take a particular account of such goods at the quay or wharf, at which they shall be so landed, or in the warehouse, if they be goods of which the account is permitted to be taken in the warehouse, and shall cause to be marked on each package of which such account shall be taken the contents thereof, and shall enter in a book prepared for that purpose, containing the name of the import ship, and of the person in whose name they are entered, the marks, numbers, and contents of each such package, the description of the goods, and the warehouse or place in the warehouse in which the same shall be deposited, and when the same shall have been so deposited with the authority of such officer he shall certify that the entry and warehousing of such goods is complete, and such goods shall from that time be considered goods warehoused; and if any such goods shall be delivered, withheld, or removed from the proper place of examination before the same shall have been duly examined and certified by such officer, such goods shall be deemed to be goods not duly entered or warehoused, and shall be forfeited. — § 87.

Goods to be entered and Duties paid according to Landing Account. — The account of the goods so taken as aforesaid shall be the account upon which the duties payable upon such goods shall be ascertained when the same shall ultimately come to be delivered upon due entry for that purpose, and the same shall be entered and the full duties thereon be paid according to the quantity taken in such account, without any abatement for any deficiency, except as herein-after provided. — § 88.

Warehoused Goods to be deposited in original Packages, or those of which Account is taken. — All goods warehoused shall be deposited in the packages in which the same shall have been imported, except as to such goods as are permitted to be skipped on the quay, or bulked, sorted, lotted, packed, or repacked in the warehouse after the landing thereof, in which case they shall be deposited in the packages in which the same shall be when the account thereof is taken by the proper officer; and if such goods are not so deposited, or if any alteration shall afterwards be made in the goods so deposited, or in the packing thereof in the warehouse, or if the same shall be removed from the room in the warehouse in which the same are deposited, without the presence or sanction of the proper officers, except for delivery under the proper warrant, order, or authority for that purpose, they shall be forfeited. — § 89.

Commissioners to direct what Goods may be bulked, sorted, packed, &c. — The Commissioners of Customs may direct what goods may be skipped on the quay, or bulked, sorted, lotted, packed, or repacked, and determine in respect of what goods the account may be taken in any warehouse approved by them for that purpose, and within what time after the landing thereof, and on such conditions as they may deem necessary. — § 90.

Warehousekeeper neglecting to stow Goods properly to forfeit 5l. — If the occupier of any warehouse shall neglect to stow the goods warehoused therein so that easy access may be had to every package and parcel thereof he shall for every such neglect forfeit the sum of 5*l.* — § 91.

Warehousekeeper neglecting to produce Goods deposited, to forfeit 5l. — If the occupier of any warehouse shall not produce to any officer of customs on his request any goods deposited in such warehouse which, shall not have been duly cleared and delivered therefrom, such occupier shall for every such neglect forfeit the sum of 5*l.* in respect of every package or parcel not so produced, besides the duties due thereon. — § 92.

Goods not duly warehoused, or fraudulently concealed, or removed, forfeited. — If any goods entered to be warehoused shall not be duly warehoused in pursuance of such entry, or being duly warehoused shall be fraudulently concealed in or removed from the warehouse, or abstracted from any package, or transferred from one package to another, or otherwise, for the purpose of illegal removal or concealment, they shall be forfeited. — § 93.

Importer or Proprietor of warehoused Goods clandestinely gaining Access thereto to forfeit 100l. — If the importer or proprietor of any goods warehoused, or any person in his employ, shall clandestinely open the warehouse, or, except in the presence of the proper officer of customs acting in the execution of his duty, gain access to the goods, such importer or proprietor shall for every such offence forfeit the sum of 100*l.* — § 94.

Duty on Goods taken out of Warehouse without Entry to be paid by Warehousekeeper, &c. — If any goods shall be taken out of any warehouse without due entry of the same with the proper officer of customs, the occupier of such warehouse shall forthwith pay the duties due upon such goods; and every person so taking out any goods without payment of duty, or who shall aid, assist, or be concerned therein, and every person who shall wilfully destroy or embezzle any goods duly warehoused, shall be deemed guilty of a misdemeanor, and shall, upon conviction, suffer the punishment by law inflicted in cases of misdemeanor: but if such person shall be an officer of customs or excise not acting in the due execution of his duty, and shall be prosecuted to conviction by the importer, consignee, or proprietor of such goods, no duty shall be payable for or in respect of such goods, and the damage occasioned by such waste, spoil, or embezzlement shall, with the sanction of the Commissioners of the Treasury, be repaid or made good to such importer, consignee, or proprietor by the Commissioners of Customs. — § 95.

If Goods be damaged by Fire, Importer not entitled to Compensation. — No compensation shall be made by the Commissioners of Customs to any importer, proprietor, or consignee of any goods by reason of any damage occasioned thereto in the warehouse by fire or other inevitable accident. — § 96.

Commissioners may remit Duties on warehoused Goods lost or destroyed. — If any goods warehoused, or entered to be warehoused, or entered to be delivered from the warehouse, shall be lost or destroyed by unavoidable accident, either on shipboard or in landing, or in receiving into the warehouse, or in the warehouse, the Commissioners of Customs may remit or return the duties due thereon. — § 97.

As to the Removal of Warehoused Goods.

Goods may be removed from one Port to another. — Any goods warehoused at any port in the U. K. may be removed by sea or by inland carriage to any other port in which the like kind of goods may be warehoused on importation, to be rewarehoused at such other port, and again as often as may be required at any other such port, to be there rewarehoused, or, with the permission of the proper officers of customs, from any warehouse in any port to any other warehouse in the same port, under such regulations and with such security as the Commissioners of Customs may direct, on the delivery to the proper officer by the person requiring such removal of a request note, stating the particulars of the goods required to be removed, the name of the port, or of the warehouse, if in the same port, to which the same are intended to be removed, and with such other information and in such manner and form as the Commissioners of Customs or the proper officer may direct or require. — § 98.

Officers at Port of Removal to transmit Account of Goods to Officers at Port of Destination. — On the delivery of any goods for removal, an account, containing the particulars thereof, shall be transmitted by the proper officers of the port of removal to the proper officers of the port or place of destination, and the person requiring the removal thereof shall enter into bond, with one sufficient surety, in a sum equal at least to the duty chargeable on such goods, for the due arrival and re-warehousing thereof at the port or place of destination within such time as the Commissioners of Customs may direct, such bond to be taken by the collector, comptroller, or other proper officer, either of the port or place of removal, or the port or place of destination, as shall best suit the residence or convenience of the parties interested in

such removal; and if such bond shall have been given at the intended port or place of destination, a certificate thereof, under the hand of the collector or comptroller or other proper officer of such port, shall, at the time of the entering of such goods, be produced to the collector, comptroller, or other proper officer of the port of removal; and such bond shall not be discharged unless such goods shall have been produced to the proper officer, and duly re-warehoused at the port of destination, within the time allowed for such removal, or shall have been otherwise accounted for to the satisfaction of the Commissioners of Customs, nor until the full du ies due upon any deficiency of such goods not so accounted for shall have been paid; but any remover may enter into general bond, with such sureties, in such amount, and under such conditions, as the Commissioners of Customs may approve, for the removal from time to time of any goods from one warehouse to another, and for the due arrival, and re-warehousing of the same at the place of destination within such time or times as the said commissioners may direct. — § 99.

Goods, on Arrival at Port of Destination, to be subject to same Regulations as Goods on first Importation. — Upon the arrival of such goods at the port or place of destination the same shall be entered and warehoused in the same manner, and under and subject to the same laws, rules, and regulations, so far as the same are or can be made applicable, as are required on the entry and warehousing of goods on the first importation thereof. — § 100.

On Arrival of Goods at Port of Destination they may be entered for Exportation or for Home Use, on Payment of Duties. — If upon the arrival of goods so removed as aforesaid at the port of destination the parties shall be desirous forthwith to export the same, or to pay duty thereon for home use, without actually lodging the same in the warehouse for which they have been entered and examined to be re-warehoused, the officers of customs at such port may, after all the formalities of entering and examining such goods for re-warehousing have been duly performed, permit the same to be entered and shipped for exportation, or to be entered and delivered for home use, upon payment of the duties due thereon, as if such goods had been actually lodged in such warehouse; and all goods so exported, or for which the duties have been so paid, shall be deemed to have been duly cleared from the warehouse. — § 101.

No Spirits which shall have been imported into the U. K. shall be removed except from Warehouse. — No spirits which shall have been imported from parts beyond the sea into the U. K. upon which a higher duty is payable on their importation into England than on their importation into Scotland or Ireland, shall be brought from Scotland or Ireland into England; nor shall any such spirits upon which a higher duty is payable on their importation into Scotland than on their importation into Ireland be brought from Ireland into Scotland, except such as shall have been duly warehoused upon the first importation thereof, according to the laws in force for the warehousing of goods, and which shall be in the warehouse at the time of such intended removal, and which shall be removed from one warehousing port to another warehousing port, according to the regulations required by law; and all such spirits, when so removed, shall be liable to the duty payable thereon in that part of the U. K. into which they shall be so removed, if they be entered for home consumption therein; and all spirits removed contrary hereto shall be forfeited, and all persons concerned in such removal, or knowingly receiving or harbouring any spirits so removed, shall forfeit the penalty of 100*l.*, or treble the value of such spirits, at the election of the Commissioners of Customs or Inland Revenue. — § 102.

Warehoused Goods, if not cleared for home Use or Exportation within 5 Years, must be re-warehoused. — All warehoused goods shall be cleared either for home use or exportation at the expiration of 5 years from the day on which the same were so warehoused, or within such further period, and in such cases as the Commissioners of the Treasury shall direct, unless the owner or proprietor of such goods shall be desirous of re-warehousing the same, in which case the same shall be examined by the proper officers, and the duties due upon any deficiency or difference between the quantity ascertained on landing and the quantity found to exist on such examination, together with the necessary expense attendant thereon, shall, subject to such allowances as are by law permitted in respect thereof, be paid down, and the quantity so found shall be re-warehoused in the name of the then owner or proprietor thereof in the same manner as on first importation. — § 103.

Goods in Warehouse not cleared or re-warehoused, or Duties paid on Deficiencies, after 5 Years, to be sold. — If any warehoused goods shall not be duly cleared, exported, or re-warehoused, and the duties ascertained to be due on the deficiencies as aforesaid shall not be paid down at the expiration of 5 years from the previous entry and warehousing thereof, or within such further period as shall be directed as aforesaid, the same, if worth the duty due thereon, shall, after 1 month's notice to the warehousekeeper, with all convenient speed be sold either for home use or exportation, with or without the consent of the warehousekeeper, and the proceeds thereof shall be applied to the payment of the duties, warehouse rent, and charges, and the surplus, if any, shall be paid to the owner or proprietor of such goods, if known, but if such owner or proprietor cannot be found, such surplus shall be carried to the crown's account, to abide the claim of such owner or proprietor on his appearing and making good his claim thereto; and if such goods shall not be worth the duty, then the same, after such 1 month's notice as aforesaid, may be exported or destroyed, with or without the concurrence of the owner thereof, or the proprietor of the warehouse in which the same were so warehoused, as the Commissioners of Customs shall see fit; and the duties due upon any deficiency thereof not allowed by law shall be forthwith paid by the proprietor of the warehouse. — § 104.

Goods in Warehouse may be sorted, repacked, &c. — With the sanction of the Commissioners of Customs, and after such notice given by the respective importers or proprietors, and at such times and under such regulations and restrictions as the Commissioners of Customs shall from time to time require and direct, it shall be lawful in the warehouse to sort, separate, pack, and repack any goods, and to make such alterations therein as may be necessary for the preservation, sale, shipment, or disposal thereof; provided that such goods be repacked in the packages in which they were imported, or in such other packages as the Commissioners shall permit (not being less in any case, if the goods be to be exported or to be removed to another warehouse, than is required by law on the importation of such goods); and also to draw off any wine or any spirits into reputed quart or pint bottles for exportation only; and to draw off and mix brandy with any wine, not exceeding the proportion of 10 gallons of brandy to 100 gallons of wine; and also to fill up any casks of wine or spirits from any other casks of the same respectively secured in the same warehouse; and also to rack off any wine from the lees, and mix any wines of the same sort, erasing from the cask all import brands, unless the whole of the wine so mixed be of the same brand; and also to take such samples of goods as may be allowed by the Commissioners of Customs, with or without entry, and with or without payment of duty, except as the same may eventually become payable as on a deficiency of the original quantity; and the duty on the surplus, if any, of such goods as may be delivered for home use shall be immediately paid, and such surplus shall thereupon be delivered for home use accordingly; and after such goods have been so separated and repacked in proper or approved packages, the Commissioners of Customs may, at the request of the importer or proprietor of such goods, cause or permit any refuse, damage, or surplus goods occasioned by such separation or repacking, or, at the like request, any goods which may not be worth the duty, to be destroyed, and may remit the duty payable thereon. — § 105.

Foreign Import or Duty-paid Packages only to be used in repacking. — No foreign packages or materials whatsoever shall be used in the repacking of any goods in the warehouse, except such as shall

have been used in the importation of warehoused goods, unless the full duties thereon shall have been first paid. — § 106.

Goods in Warehouse may be taken out, under certain Regulations.—The Commissioners of Customs may permit any goods to be taken out of the warehouse without payment of duty, for such purpose or for such period as to them may appear expedient, and in such quantities, and under such regulations and restrictions, and with such security by bond for the due return thereof or the payment of the duties due thereon, as they may direct or require; and the officers of customs of any port where any premises shall be approved as a bonded sugar house may deliver any quantity of sugar, on the application of the proprietor or occupier of such bonded sugar house, and on entry of such sugar with the proper officer of customs, for the purpose of being there refined, under the locks of the crown, for removal to the Isle of Man or for exportation; and all sugars so delivered shall be lodged and secured in such premises, under such conditions, regulations, and restrictions, as the Commissioners of Customs shall from time to time direct. — § 107.

Refiner to give Bond. — Upon the entry of any sugar to be refined in any premises approved under this act, the proprietor or occupier shall give bond, to the satisfaction of the officers of the customs, in a sum equal to double the amount of the duty payable on a like quantity of sugar, with a condition that the whole of such sugar shall be actually subjected to the process of refinement upon the said premises, and that within 4 months from the date of such bond the whole of the refined sugar and treacle produced by such process shall be either duly removed to the Isle of Man or exported from the said premises, or delivered into an approved bonded warehouse under the locks of the crown, for the purpose of being eventually so removed or exported. — § 108.

AS TO THE ENTRY OF WAREHOUSE GOODS FOR HOME CONSUMPTION AND EXPORTATION, AND THE DELIVERY THEREOF.

Entry for Exportation. — No warehoused goods shall be taken or delivered from the warehouse, except upon due entry, and under the care of the proper officers, for exportation, or upon due entry and payment of the full duties payable thereon for home use, except goods delivered into the charge of the searchers to be shipped as stores, in such quantities as the collector or comptroller shall allow, subject to the directions of the Commissioners of Customs, and under such regulations as they may see fit to make. — § 109.

Persons entering warehoused Goods for Home Use to deliver Bill of Entry, and pay down Duties. — Upon the entry of any goods to be cleared from the warehouse for home use, the person entering such goods shall deliver a bill of entry, and duplicates thereof, in like manner and form, containing the same particulars as are before required on the entry of goods to be delivered for home use on the landing thereof, as far as the same may be applicable, and shall at the same time pay down to the proper officer of customs the full duties payable thereon, not being less in amount than according to the account of the quantity taken by the landing waiter or other proper officer on the first entry and landing thereof, except as to the following goods; viz., tobacco, wine, spirits, figs, currants, raisins, and sugar, the duties whereon, when cleared from the warehouse for home use, shall be charged upon the quantity of such goods ascertained by weight, measure, or strength at the time of actual delivery thereof, unless there is reasonable ground to suppose that any portion of the deficiency or difference between the weight, measure or strength ascertained on landing and first examination of any such last-mentioned goods, and that ascertained at the time of actual delivery, has been caused by illegal or improper means, in which case the proper officer of customs shall make such allowance only for loss as he may consider fairly to have arisen from natural evaporation or other legitimate cause. — § 110.

Value of Goods to be estimated by Officers at the Market Price. — When any deficiency occurs in goods chargeable to pay duty according to the value thereof, the value thereof shall be estimated as nearly as conveniently may be by the officers of customs according to the market price of the like sort of goods. — § 111.

Deficiencies in Goods entered for Exportation not to be charged with Duty unless fraudulent. — No duty shall be charged in respect of any deficiency in goods entered and cleared from the warehouse for exportation, unless the officers of customs have reasonable ground to suppose that such deficiency or any part thereof has arisen from illegal abstraction. — § 112.

Entries for Wood Goods restricted. — No entry for home consumption shall from and after the passing of this act be received for or in respect of any timber or wood goods deposited in any warehouse for security of duties, for any less quantity at any one time than 5 loads of such timber or wood goods, unless such wood goods shall be delivered by tale, in which case such entry may be passed for any quantity thereof not being less than 240 pieces, or 2 great hundreds of such wood goods; and no less quantity of such timber or wood goods shall be delivered in virtue of any such entry at any one time than 1 load of such timber or wood goods, or 90 pieces of such wood goods if delivered by tale. — § 113.

AS TO THE EXPORTATION AND ENTRY OF GOODS, AND THE CLEARANCE OF SHIPS FROM THE U. K. TO PARTS BEYOND SEAS.

Warehoused Goods not to be exported in Ships of less than 50 Tons Burden, except to Guernsey or Jersey. — No person shall export any warehoused goods, nor enter any such goods for exportation from the U. K. to parts beyond the seas, in any ship of less burden than 50 tons, except to the islands of Guernsey and Jersey in ships not being of less than 40 tons burden, regularly trading to those islands. — § 114.

Master to deliver Certificate of Clearance of last Voyage, and to make Entry outwards. — The master of every ship in which any goods are to be exported from the U. K. to parts beyond seas, or his agent, shall, before any goods be taken on board, deliver to the collector or comptroller a certificate from the proper officer of the due clearance inwards or coastwise of such ship of her last voyage, and shall also deliver therewith an entry outwards of such ship, verified by his signature, in the following form or to the same effect, and containing the several particulars indicated or required thereby.

ENTRY OUTWARDS.

and if such ship shall have commenced her lading at some other port, the master shall deliver to the searcher the clearance of such goods from such other port; and if any goods be taken on board any ship at any port before she shall have been entered outwards at such port (unless a *stiffening order*, when necessary, shall be issued by the proper officer to lade any heavy goods for exportation on board such ship), the master shall forfeit the sum of 100*l.* — § 115.

Goods not to be shipped except on proper Days and Places, nor until Entry and Clearance.—No goods shall be shipped, put off, or water-borne to be shipped for exportation, from any port or place in the U. K., except on days not being Sundays or holidays, nor from any place except some legal quay, wharf, or other place duly appointed for such purpose, nor without the presence or authority of the proper officer of customs, nor before due entry outwards of such ship, and due entry of such goods, nor before such goods shall have been duly cleared for shipment; and it shall be lawful for the searcher to open all packages, and fully to examine all goods shipped or brought for shipment at any place in the U. K.—§ 116.

AS TO THE ENTRY AND CLEARANCE OF GOODS FOR EXPORTATION.

On Entry outwards, Bond for due shipping and landing shall be given.—Before any warehoused goods, British-wrought plate, goods subject to duties of customs, or entitled to any drawback of customs, on exportation, or exportable only under particular rules, regulations, or restrictions, shall be permitted to be exported, the exporter or his agent shall deliver to the collector or comptroller a bond note or account of such goods, and give security by bond in double the amount of duty payable by law upon the importation of such goods, with one sufficient surety, that such goods shall be duly shipped and exported, and shall be landed at the place for which they are entered outwards, or otherwise accounted for to the satisfaction of the Commissioners of Customs; and such bond note, when certified by the proper officer, shall be the export entry for such goods. — § 117.

Exporter to deliver Shipping Bill. — Before any such goods shall be shipped or water-borne to be shipped for exportation, the exporter or his agent shall deliver to the searcher or other proper officer a SHIPPING BILL of such goods in the form following or to that effect, and containing the particulars indicated therein or required thereby. — § 118.

Shipping Bill for { 1. Warehoused or Drawback Goods. 2. Foreign Goods not for Drawback. 3. Goods exported under some particular Rule, Regulation, or Restriction. (*State as above described the Class to which the goods to be exported belong*).

Dated day of

Inland Revenue Drawback. — No drawback of excise shall be allowed upon any goods cleared for exportation, unless the person intending to claim such drawback shall have given due notice to the officer of excise, and shall have produced to the searcher, at the time of clearing such goods a proper document under the hand of the officer of excise containing the description of such goods; and if such goods be found to correspond with the particulars of the goods contained in such document, and be duly shipped and exported, the searcher shall, if required, certify such shipment upon such document, and shall transmit the same to the officer of excise. — § 119.

Goods not entitled to Drawback if of less Value than claimed. — No drawback shall be allowed upon the exportation of any goods entered for drawback or as stores which shall be of less value than the amount of the drawback claimed; and all such goods so entered shall be forfeited, and the person who caused such goods to be entered shall forfeit the sum of 200*l.*, or treble the amount of drawback claimed in such case, at the election of the Commissioners of Customs. — § 120.

No drawback on Tobacco not properly manufactured, &c. — No drawback shall be allowed on any tobacco not wholly manufactured from tobacco on which the duty on importation shall have been paid, nor on any tobacco mixed with dirt, rubbish, or other substance; and every person who shall enter or ship, or caused to be entered or shipped, any tobacco contrary hereto, shall, over and above all other penalties which he may thereby incur, forfeit treble the amount of the drawback sought to be obtained, or 200*l.*, at the election of the Commissioners of Customs, and all such tobacco shall be forfeited. —§ 121.

Shipping Bill for Free Goods, &c. to be delivered to Searcher. — Before any goods in respect of which no bond is required shall be shipped or water-borne to be shipped for exportation, the exporter or his agent shall deliver to the searcher a shipping bill thereof, with such duplicates as may be required by him, in the following form or to that effect, and containing the several particulars indicated in or required thereby: —

SHIPPING BILL FOR BRITISH MANUFACTURES OR FOREIGN GOODS FREE OF DUTY.

Dated this day of 18

and such shipping bill shall be the entry for the goods contained therein; provided, that at Liverpool, and (with the sanction of the Commissioners of Customs) at any other port where the docks, quays, and wharfs are in like manner wholly or principally under the control and management of one and the same corporate body, the owner, charterer, consignee, broker, agent, or other person acting in the loading and clearance of the exporting ship shall also prepare a full and accurate list or manifest of all such goods from the bills of lading and freight list thereof, and shall sign and leave with the collector of the customs, within 14 days after such ship shall have cleared outwards, a correct transcript of such last-mentioned list or manifest, with the addition of the value of such goods, if any, as shall have been previously chargeable with duty, at value, and of British goods, distinguishing therein the names of the several shippers of such goods, according to the bills of lading; and on failure to prepare such list or manifest, and to sign and deliver such transcript as aforesaid, such owner, charterer, consignee, broker, or other person as aforesaid shall forfeit the sum of 20*l.*—§ 122.

Shipping Bill signed by Searcher to be the Clearance for the Goods.— The shipping bill or bills, when filled up, and signed by the exporter or his agent, or the consignee of the ship, as the case may be, in such manner as the proper officer may require, and countersigned by the searcher, shall be the clearance for all the goods enumerated therein; and if any of such goods shall consist of tea, spirits, or tobacco, the exporter or his agent shall furnish to the searcher an account thereof, containing the number and description of the packages, and the respective quantities contained therein, which, when certified by the searcher, shall accompany the ship, and have the same force and effect as the cocket in use prior to the passing of this act; and if the exporter or his agent shall require a similar certificate in respect of any other goods shipped for exportation, the searcher shall, on its being presented to him for that purpose, certify the same in like manner: provided always, that if any such certificate be required to be in any particular form for goods destined for the Zollverein or any other foreign state, or under the name of Cocket, such certificate may be so prepared and denominated.—§ 123.

Licensed Lighterman to carry Goods.—If any goods cleared for drawback or from the warehouse shall be carried or water-borne to be put on board any ship for exportation by any person not at the time duly licensed and authorised to act as a licensed lighterman, either in the port of London or any other port at which lightermen are required to be so licensed, or by any person not being in the employ of such lighterman at the time duly authorised to act as such, every such person shall for every such offence forfeit the sum of 20*l.*—§ 124.

Warehoused Goods shipped for Exportation without Authority forfeited.— If any goods taken from the warehouse for removal or for exportation shall be removed or shipped, except with the authority or under the care of the proper officer of customs, and in such manner, by such persons, within such time, and by such roads or ways as such officer shall permit or direct, such goods shall be forfeited.—§ 125.

Duties may be remitted on warehoused Goods lost or destroyed in Removal or Shipment.— If any goods duly entered for delivery from the warehouse for removal or exportation shall be lost or destroyed by unavoidable accident, either in the delivery from the warehouse or the shipping thereof, the Commissioners of Customs may remit the duties due thereon.—§ 126.

AS TO THE ISSUE OF DEBENTURES FOR AND PAYMENT OF DRAWBACK ON GOODS EXPORTED.

Issuing and passing Debenture.—For the purpose of computing and paying any drawback claimed and payable upon any goods duly entered, shipped, and exported, a debenture shall in due time after such entry be prepared by the collector or comptroller, certifying in the first instance the entry outwards of such goods, and so soon as the same shall have been duly exported, and a notice containing the particulars of the goods shall have been delivered by the exporter to the searcher, the shipment and exportation thereof shall be certified to the collector or comptroller upon such debenture by the searcher, and the debenture shall thereupon be computed and passed with all convenient despatch.—§ 127.

Declaration as to Exportation and Right to Drawback.—The person entitled to any drawback on any goods duly exported, or his agent duly authorised by him for that purpose, shall make and subscribe a declaration upon the debenture that the goods mentioned therein have been actually exported, and have not been relanded, and are not intended to be relanded, in any part of the U. K., and that such person at the time of entry and shipping was and continued to be entitled to thedrawback thereon, and the name of such person shall be stated in the debenture, which shall then be delivered to such person or his agent, and the receipt of such person on the debenture, countersigned by the holder of such debenture, if the same shall have been transferred in the meantime, shall be the discharge for such drawback when paid.—§ 128.

Payment within Two Years.— No debenture for any drawback allowed upon the exportation of any goods shall be paid after the expiration of two years from the date of the shipment of such goods.—§ 129.

Warehouse or Debenture Goods not exported, &c., or relanded, &c., without Entry, forfeited.— If any goods which have been cleared to be exported for any drawback shall not be duly exported to parts beyond the seas, or shall be unshipped or relanded, in any part of the U. K. (such goods not being duly relanded or discharged as short-shipped under the care of the proper officers), or shall be carried to any of the Channel Islands (not having been duly entered, cleared, and shipped to be exported or carried directly to such islands), the same shall be forfeited, together with any ship, boat, or craft which may have been used in so unshipping, relanding, landing, or carrying such goods from the ship in which the same were shipped for exportation; the master of such ship, and any person by whom or by whose orders or means such goods shall have been so unshipped, relanded, landed, or carried, or who shall aid, assist, or be concerned therein, shall forfeit a sum equal to treble the value of such goods, or a penalty of 100*l.*, at the election of the Commissioners of Customs.—§ 130.

Drawbacks of Duties on Wine allowed for Officers in the Navy.— A drawback of the whole of the duties of customs shall be allowed for wine intended for the consumption of officers of H. Majesty's

navy on board such of H. Majesty's ships in actual service as they shall serve in, not exceeding the quantities of wine in any one year for the use of such officers herein-after respectively mentioned, viz.,

		Galls.
For every	Admiral	1,260
—	Vice-Admiral	1,050
—	Rear-Admiral	840
—	Captain of the 1st and 2d Rate	630
—	Captain of the 3d, 4th, and 5th Rate	420
—	Captain of an inferior Rate	210
—	Lieutenant and other Commanding Officer, and for Marine Officer, Master, Purser, and Surgeon	105

unless such wine be taken from the warehouse without payment of duty under such regulations as the Commissioners of Customs may direct: Provided always, that in either case such wine be shipped at ports approved of by the said commissioners.—§ 131.

Persons entering such Wine for Drawback to declare Name and Rank of Officer claiming the same.—The person entering such wine, and claiming the drawback for the same, shall state in the entry and declare on the debenture the name of the officer for whose use such wine is intended, and of the ship in which he serves; and such wine shall be delivered into the charge of the officers of the customs at the port of shipment, to be shipped under their care; and the commanding officer for the time being of such ship, having certified upon the debenture the receipt of such wine into his charge, and the proper officer of the customs having certified to the shipment on the debenture, the same shall be computed and passed, and be delivered to the person entitled to receive the same.—§ 132.

Officers leaving the Service, &c., Wine permitted to be transferred to others.—If any such officer shall leave the service, or be removed to another ship, the officers of the customs may permit the transfer of any such wine from one officer to another, as part of his proportion, whether on board the same ship or another, or the transhipment from one ship to another for the same officer, or the re-landing and warehousing for future reshipment; and the officers of customs at any port may receive back the duties for any such wine, and deliver the same for home use; but if any of such wine be not laden on board the ship for which the same was intended, or be unladen from such ship without permission of the proper officers of customs, the same shall be forfeited.—§ 133.

Pursers of Ships of War may Ship Tobacco for the Use of Crew free of Duty, on giving Bond.—The purser of any of H. M. ships of war in actual service may enter and ship, at any port approved by the Commissioners of Customs, in the proportions herein-after mentioned, any tobacco there warehoused in his name, or transferred into his name for the use of the ship in which he shall serve, provided such purser shall deliver to the collector or comptroller of such port a certificate from the captain of such ship, stating the name of the purser, and the number of men belonging to the ship, and also give bond, with one sufficient surety, in treble the duties payable on the tobacco, that no part thereof shall be re-landed without leave of the officers of customs.—§ 134.

Purser removed from one Ship to another may tranship Tobacco, with Permission of Collector.—If any purser be removed from one ship to another, the collector or comptroller of any port may permit the transhipment of the remains of any such tobacco, for the use of such other ship, upon due entry of such tobacco by such purser, setting forth the time when and the port at which such tobacco was first shipped; and if any such ship shall be paid off, the collector or comptroller of the port may permit the remains of any such tobacco to be landed, and to be entered by the purser of such ship, either for payment of duties, or to be warehoused for the term of 6 months, for the supply of some other such ship, in like manner as any tobacco may be warehoused and supplied at any such port, or for payment of all duties within such 6 months; and all tobacco warehoused for the purpose of so supplying ships of war shall be subject to the provisions of any act in force relating to the warehousing of tobacco generally, as far as the same are applicable, and are not expressly altered by any of the provisions herein particularly made.—§ 135.

Limiting the Quantity of Tobacco.—No greater quantity of such tobacco shall be allowed to any ship of war than 2 lbs. by the lunar month for each of the crew of such ship, nor shall any greater quantity be shipped at any one time than sufficient to serve the crew of such ship for 6 months after such rate of allowance; and the collector or comptroller of the port at or from which any such tobacco shall be supplied to any such ship, or landed from any such ship, or transferred from one such ship to another, shall transmit a particular account thereof to the Commissioners of Customs, in order that a general account may be kept of all the quantities supplied to and consumed on board each of such ships under the allowances before granted.—§ 136.

As to the Shipping of Stores for the Use of Foreign-bound Vessels.

Victualling Bill for Stores.—The master of every ship of the burden of 50 tons or upwards, departing from any port in the U. K. upon a voyage to parts beyond the seas, the duration of which out and home shall not be less than 40 days, shall, upon due application made by him, and upon such terms and conditions as the Commissioners of Customs may direct, receive from the searcher an order for the shipment of such stores as may be required and allowed by the collector or comptroller for the use of such ship, with reference to the number of the crew and passengers on board, and the probable duration of the voyage on which she is about to depart; and all demands for such stores shall be made in such form and manner as such collector or comptroller shall require, and shall be signed by the master or owner of the vessel; and after such stores are duly shipped the master or his agent shall make out an account of the stores so shipped, together with any other stores then already on board, and the same, when presented to the searcher, signed by him, and countersigned by the collector or comptroller, shall be the Victualling Bill; and no stores shall be shipped for the use of any ship, nor any articles taken on board any ship be deemed to be stores, except such as shall be borne upon such victualling bill.—§ 137.

As to the Clearance of Ships Outwards.

If inward Cargo reported for Exportation, Copy of Report thereof to be delivered to the Searcher.—If there be on board any ship any goods, being part of the inward cargo reported for exportation in the same ship, the master shall, before clearance outwards of such ship from any port in the U. K., deliver to the searcher a copy of the report inwards of such goods, certified by the collector or comptroller; and if such copy be found to correspond with the goods so remaining on board, the searcher shall sign the same, to be filed with the certificates or cockets, if any, and victualling bill of the ship.—§ 138.

Before Clearance Master to deliver Content.—Before any ship shall be cleared outwards from the U. K. with any goods shipped or intended to be shipped on board the same, the master shall deliver a *content* of such ship to the searcher, in the form or to the effect following, and containing the several particulars therein required, as far as the same can be known by him, and shall make and subscribe the declaration at the foot thereof, in the presence of the collector or comptroller, and shall answer such questions as shall be demanded of him concerning the ship, the cargo, and the intended voyage, by such collector or comptroller:

CONTENT.

Port of

Ship's Name.	Tonnage and Number of Guns.		If British, Port of Registry; if Foreign, the Country.	Number of Crew.	Name of Master.	Number of Passengers or Troops.
	Tons.	Guns.				
Here state the Particulars according to the above Headings.						

Warehoused Goods.	Drawback and restricted Goods.	British Goods and Foreign Goods free of Duty, and Foreign Goods not for Drawback.
If any, state Marks and Numbers of Packages.	*If any, state Description of Packages.*	*If any, state "Sundry Packages containing," either Class, as the Case may be.*
If any Goods shall have been reported inwards for Exportation in such Ship they must be so stated.		

Cleared_____. Examined_____.
(Signed)_____ Searcher.
Dated_____.

I do declare, that the above Content is a true account of all goods shipped or intended to be shipped on board the above-named ship, and correct in all other particulars.

(Signed)_____ Master.

Signed and declared, this_____ day of _____ before me,
(Signed)_____ Collector or Comptroller.

and before clearance the certificates, if any, shall be delivered to the searcher, who shall compare the shipping bills with the content and certificates, if any, and file such certificates, copy of report inwards, if any, of goods reported for exportation in such ship, and the victualling bill, with a label attached and sealed thereto, in the form or to the effect following:

(*Seal.*)

Number of Certificates (*Number in Figures*).
Ship (*Name of Ship*).
Master (*Name of Master*).
(*Signature*) _____ Searcher.
(*Date of Clearance.*)
(*Signature*) _____ Collector or Comptroller.

and such label, when filled up, and signed by the searcher and the collector or comptroller, shall, as to the goods comprised therein, be the clearance and authority for the departure of the ship; and the shipper of any British goods and such goods as were previously chargeable with duty at value laden in such ship shall, under a penalty of 20*l.*, deliver to the broker, agent, or other person clearing such ship, a duplicate of the bill of lading thereof at the time of signing thereof, with an endorsement thereon of the quantity and value of such goods; and such broker, agent, or other person as aforesaid shall, within 14 days after such final clearance of the ship, sign and deliver to the collector or comptroller of customs a full and accurate list of all such goods, with the quantities and value thereof, from the bills of lading so delivered to him, with such bill or bills of lading annexed thereto, and on failure thereof such broker, agent, or other person as aforesaid shall forfeit the sum of 20*l.*, and for this purpose the duplicate bill of lading so required shall not be liable to any stamp duty.—§ 139.

Goods on board to correspond with Content. — If any goods liable to duty on importation, or taken from the warehouse to be exported, or entitled to drawback on exportation, which are enumerated in the content of any ship, shall not be duly shipped before the departure of such ship, or shall not be duly certified by the proper officer as short-shipped, such goods shall be forfeited; or if any such goods shall be taken on board such ship, not being enumerated in such content, the master of such ship shall forfeit the sum of 5*l.* in respect of every package of such goods; and if any goods duly shipped on board such ship shall be landed at any other place than that for which they shall have been cleared, unless otherwise accounted for to the satisfaction of the Commissioners of Customs, the master of such ship shall forfeit a sum equal to treble the value of the goods so landed.—§ 140.

Goods shipped contrary to Provisions forfeited. — If any goods shall be shipped, put off or waterborne to be shipped, without being duly cleared, or otherwise contrary to the provisions of this act, the same shall be liable to forfeiture.—§ 141.

Ships leaving in Ballast. — Before any ship shall depart in ballast from the U. K. for parts beyond the seas, not having any goods on board, except stores from the warehouse borne upon the victualling bill of such ship, nor any goods reported inwards for exportation in such ship, the collector or comptroller shall clear such ship in ballast, by notifying such clearance and the date thereof on the victualling bill, and deliver the same to the master of such ship as the clearance thereof; and the master of such ship shall answer to the collector or comptroller such questions touching her departure and destination as shall be demanded of him; and ships having only passengers with their baggage on board, and ships laden only with chalk or slate, shall be deemed to be in ballast; and if any such ship, whether laden or in ballast, shall depart without being so cleared, if she have any such stores on board, the master shall forfeit and pay the sum of 100*l.*—§ 142.

As to the Boarding of Ships after Clearance Outwards.

Officers may board any Ship after Clearance. — Any officers of customs may go on board any ship after clearance outwards within the limits of any port in the U. K., or within 4 leagues of the coast thereof, and may demand the ship's clearance; and if there be any goods on board in respect of which certificates are required, not contained in such certificates, or any stores not endorsed on the victualling bill, such goods or stores shall be forfeited; and if any goods contained in such certificates be not on board, the master shall forfeit the sum of 20*l.* for every package or parcel of goods contained in such certificates, and not on board.—§ 143.

If Officers put Seals upon Stores, and such Seals be broken, Master to forfeit 20*l.* — If any officer of customs shall place any lock, mark, or seal upon any goods taken from the warehouse without payment of duty as stores on board any ship or vessel departing from any port in the U. K., and such

lock, mark, or seal be wilfully opened, altered, or broken, or if any such stores be secretly conveyed away, either while such ship or vessel remains at her first port of departure, or at any other port or place in the U. K., or on her passage from one such port or place to another, before the final departure of such ship or vessel on her foreign voyage, the master shall forfeit the sum of 20*l.*—§ 144.

Ships not bringing to at Stations, Penalty 20*l.*—If any ship departing from any port in the U. K. shall not bring to at such stations as shall be appointed by the Commissioners of Customs for the landing of officers from such ships, or for further examination previous to such departure, the master of such ship shall forfeit the sum of 20*l.*—§ 145.

Time of Exportation and Departure defined.—The time at which any goods shall be shipped on board any export ship shall be deemed to be the time of exportation of such goods, and the time of the last clearance of any ship shall be deemed to be the time of departure of such ship.—§ 146.

Goods prohibited by Proclamation.—The following goods may, by proclamation or order in council, be prohibited either to be exported or carried coastwise: arms, ammunition, and gunpowder, military and naval stores, and any articles which H. Majesty shall judge capable of being converted into or made useful in increasing the quantity of military or naval stores, provisions, or any sort of victual which may be used as food by man, and if any goods so prohibited shall be exported from the U. K. or carried coastwise, or be water-borne to be so exported or carried, they shall be forfeited.—§ 147.

Then follow the clauses in regard to the COASTING TRADE, COLONIAL TRADE, and SMUGGLING, which see.

The commissioners of customs, agreeably to the powers given them to that effect by the foregoing statute, and others, have appointed the undermentioned places, within the several ports of the U. K., at which vessels coming into or departing out of such ports shall bring to, for the boarding or landing of customs' officers.

The following clause in the act 16 & 17 Vict. c. 107. has reference to this matter.

If any ship coming into the U. K. or into the Channel Islands, shall not come as quickly up to the proper place of mooring or unlading as the nature of the port will admit, without touching at any other place, and in proceeding to such proper place shall not bring to at the stations appointed by the Commissioners of Customs for the boarding of ships by the officers of customs, or if after arrival at such place such ship shall remove from such place, except directly to some other proper place of mooring or unlading, and with the knowledge of the proper officer of the customs, or if the master of any ship on board of which any officer is stationed neglect or refuse to provide every such officer sufficient room under the deck in some part of the forecastle or steerage for his bed or hammock, the master of such vessel shall forfeit the sum of 20*l.*—§ 47.

ENGLAND.

Ports.	*Stations for bringing-to.*
LONDON	Gravesend Reach, below the Custom-house.
ABERYSTWITH	On the bar, or a little above the junction of the rivers Rhydol and Ystwith.
Aberdovey	A little to the westward of the town, in the river Dovey.
ALDBOROUGH	Orford haven, the entrance to the rivers Ore and Alde.
ARUNDEL	The piles on the eastern side of the river, between the revenue watch-house and the Duke of Norfolk's Quay, in the harbour of Littlehampton.
BARNSTAPLE	Skern and watch-house, Appledore.
BEAUMARIS	Opposite the town, at Fryar's Road.
Almwch	Within the harbour.
Conway	In the roadstead opposite the town.
Carnarvon	In the bay off the town, opposite the Bell Tower, and at Abermenol.
Pwllheli	At the entrance of the harbour, by the Gimblet Rock.
Barmouth	In the harbour.
Holyhead	In the harbour.
BERWICK	At the entrance of the harbour, near the pier head.
BIDEFORD	Skern and watch-house, Appledore.
BOSTON	Hob hole.
BRIDGEWATER	Between Botestall Point, on the coast of the Bristol Channel, and Black Rock, about a mile within the mouth of the river Parrott.
BRIDLINGTON	The bay or harbour.
BRIDPORT	The outer buoy, distant about 300 yards, abreast of the harbour.
BRISTOL	Pill and Kingsroad.
CARDIFF	Penrith Roads, a little to the eastward of the mouth of the river Taff.
CARDIGAN	At Pwllcarn, a little inside the bar or harbour's mouth.
CARLISLE	Fisher's Cross.
CHEPSTOW	At the entrance of the river Wye.
CHESTER	Dowpool, 6 miles from Hoylake.
CHICHESTER	Cockbush harbour.
CLAY	Blackey and Clay Harbour.
COLCHESTER	Coln River, off Mersea Stone, Mersea Island.
COWES (EAST)	Roadstead of Cowes, extending from east to west about 2½ miles.
DARTMOUTH	Between the mouth of the harbour and Sandquay Point.
Salcombe	At the mouth of the harbour and Snaps Point.
DEAL	In the Downs, in open roadstead.
DOVER	The outer harbour.
Folkestone	In the harbour.
EXETER	At the Passage Way, Exmouth.
Teignmouth	At the Point.
FALMOUTH	In the harbour, off Kiln Quay and watch-house.
FAVERSHAM	Between the mouth of Faversham Creek and the Horse Sand in the East Swale.
Milton	At the mouth of Milton Creek in the Swale.
FOWEY	Near the Custom-house, not far from the entrance of the harbour.
GLOUCESTER.	
GRIMSBY	At the outfall, near the entrance of the harbour.
GOOLE	Hull Roads.
GWEEK	Durgan Roads, just at the entrance of the river Hel.
HARWICH	In the harbour, between the Guard and Walton Ferry.
HULL	Hull Roads, between the east end of the citadel and the entrance to the Humber dock to the westward.
ILFRACOMBE	In the harbour.
IPSWICH	In the harbour, between the Guard and Walton Ferry.
ISLE OF MAN	
Douglas	In their respective bays.
Darby Haven	
Peel	
Ramsey	
LANCASTER	Glasson Dock, on the river Lune.
Poulton	Sea Dyke, entrance of the river Wyre.
Ulverston	Pile Cowdry, near the Isle of Walney.
LEIGH	Leigh Slade, or Leigh Swatch, which channel is formed by the spit of a sand called Marsh End, leading from the east end of Canvy Island, and nearly opposite to a windmill, called the Hamlet Mill, situate upon the Cliff, about ¼ a mile to the westward of Southend, and about 2 miles from Leigh.
LIVERPOOL	At the entrance of the respective docks.
LYME	The basin within the pier or cobb of Lyme Regis.
LYNN	Nottingham Point, intermediate space between Common Strath Quay, where the estuary narrows into a river, about 3 miles below the town, or as near as circumstances permit within the point.
MALDON	Barrow Hills, opposite Blackwater River, Maldon.
MILFORD	In the haven, opposite the town of Milford.
MINEHEAD	The entrance of the harbour.
NEWCASTLE	Opposite the watch-house, at the entrance of the river Tyne.
Shields	Low Lights, North Shields.
Blythmouth	At the entrance of the harbour.
NEWHAVEN	In the stream, between the piers and the tide surveyor's watch-house.
NEWPORT (Wales)	At the watch house, 1 mile from the Custom-house.
PADSTOW	Hawker's Cove, within the harbour.
PENZANCE	Gwavas Lake.
St. Michael's	St. Michael's Mount Roads.
PLYMOUTH	Within the line of the breakwater, viz. the Sound, Catwater, and Hamoaze.
POOLE	At the entrance of the harbour, between South Deep, opposite Brownsea Castle, and the Essex buoy, opposite the castle stables.
PORTSMOUTH	Between Blockhouse Point and the north end of her Majesty's dockyard.
Langstone	In the roadstead, within 1 mile of the Spit Buoy.
RAMSGATE	In the harbour.
Margate	In the harbour.

Ports.	Stations for bringing-to.
Sandwich	At the entrance of the harbour.
ROCHESTER	Sheerness.
RYE	The outer channel, and in Stag's Hole, in the inner channel.
Hastings	In the open roadstead.
Eastbourne	In the open roadstead.
SCARBOROUGH	Entrance of the harbour, opposite the light-house, at the end of Vincent's Pier.
SHOREHAM	Near the entrance of the harbour, in the western branch, opposite the customs watch-house and Kingston Wharf.
SOUTHAMPTON	Itchen buoy, or Bursledon buoy.
SOUTHWOLD	Opposite the jetty, near the entrance of the harbour.
STOCKTON	Ninth buoy, or opposite Cleveland Port.
ST. IVES	In the bay, within ½ mile of St. Ives pier.
Hayle	The same.
SUNDERLAND	At the entrance of the harbour, near the watch-house on the South pier.
SWANSEA	In the harbour.
Neath	Briton Ferry, near the entrance of Neath river.
TRURO	Falmouth Harbour.
WELLS	Between the entrance of the harbour and Wells Quay.
WEYMOUTH	Weymouth Roads.
WHITBY	The harbour.
WHITEHAVEN	In the harbour, between the tongue and bulwark.
Harrington, *Workington*, *Maryport*	In their respective harbours.
WISBEACH	At the light-houses about 3 miles below the station at Sutton Wash.
WOODBRIDGE	Bawdsey Ferry, the entrance of the river Deben.
YARMOUTH	Yarmouth Roads, between Nelson's monument and the haven's mouth,—on the Brush, a short distance within the haven's mouth, at the S. E. angle of the river.
	SCOTLAND.
ABERDEEN	That part of Aberdeen Bay which falls within a line beginning at the eastern-most point of the Girdle Ness, and running north 1½ mile, to a point due east of the centre of the Broad Hill.
Peterhead	The bay.
Newburgh	Within the river Ythan, opposite to the village Newburgh.
Stonehaven	Stonehaven Bay, within 800 yards of the entrance of the harbour.
AYR	South Quay at Ayr.
BANFF	The Legal Quays.
BORROWSTONESS	The harbour.
Inverkeithing	The harbour.
CAMPBELTOWN	The harbour.
DUMFRIES	The harbour.
DUNDEE	The harbour.
Newburgh and *Perth*	Caroline Roads, 1½ mile to the eastward of the harbour of Dundee.
GLASGOW	Entrance of the harbour.
GRANGEMOUTH	Entrance of the harbour.
Alloa	Alloa roadstead.
Kincardine	Kincardine roadstead.
GREENOCK	From Gravel Point, to the eastward of the town of Greenock, in the county of Renfrew, to Kempock Point, being the western point of Gourock Bay, including therein Cartsdyke Bay, Greenock Roads, the anchorage at the tail of the bank, and Gourock Bay.
Rothsay	Rothsay Bay, lying and being within Boyany Point, on the east of the town of Rothsay, in the Isle of Bute, county of Bute, and Ardmalish Point on the west of the said town.
Oban	Oban Bay, in the county of Argyle, as lies within Fishing-house Point on the eastern side, and Currick Point on the western side of the said bay.
Tobermory	The bay of Tobermory, lying and being within Leidag Point to the south-east, Fortmore Point to the north-west, and the Isle of Calve on the east of Tobermory, Isle of Mull, county of Argyle.
Inverary	The roadstead of Inverary, lying and being off the town of Inverary, in the county of Argyle, and extending ½ a mile north-east of the quay of the said town.
Lochgilphead	Lochgilphead Roads, at the east end of the Crinan Canal, lying and being within Ardrishaig Point, on the western side of Lochgilphead and Kilmory Point, on the eastern side of the said loch.
INVERNESS	The harbour.
IRVINE	The harbour.
KIRKALDY	Entrance of the harbour.
Aberdour and *Burntisland*	Burntisland Roads.
Pittenween, *Dysart*, *Wemyss*, *Methil*, *Leven*, *Largo*	Kirkaldy Bay.
Elie	Largo Bay.
Anstruther	Entrance to their respective harbours.
St. Andrew's	St. Andrew's Bay.
KIRKWALL	The Bay or Kirkwall Roads, extending along the beach, in a north east direction to Thief's Holm, and in a westerly direction to Quanterness Skerry, thence in a southerly direction to the Legal Quays.
Stromness	The bay called Cairston Roads.
LEITH	Between the martello tower and chain pier at Newhaven.
Dunbar	In the harbour.
Fisherrow	In the harbour.
LERWICK	In the bay, opposite the Custom-house.
MONTROSE	Within the bar, at the entrance of the river South Esk, which is called the Still.
Arbroath	The harbour.
PORT GLASGOW	Port Glasgow Roads, or roadstead, commencing at the black and white chequered buoy, on the east point of the bank called the Perch, distant from the harbour about 200 yards, and extending in a south-easterly direction by the course of the river Clyde to the old ruins called Newark Castle.
STORNAWAY	The harbour.
STRANRAER	The harbour.
Port Patrick	The harbour.
THURSO	Thurso Bay, within Holburn Head to the anchorage ground at Scrabster Roads.
Wick	Wick Bay, when abreast or within the headland called the Old Man of Wick.
	IRELAND.
BALTIMORE, *Castle Townsend*, *Crook Haven*, *Bere Haven*	At the entrance of the harbours of Castle Townsend, Baltimore, Crook Haven, and Bere Haven.
BELFAST (Floating Stn.)	Garmoyle Roads, in Belfast Lough.
COLERAINE	Port Rush Bay, outside the harbour.
CORK (COVE)	Between the Spit buoy and the town of Cove.
West Passage	Between Ferry Point to the southward and Horse Head to the north-west.
Kinsale	Upper Cove on the eastern side of the harbour.
Youghall	Within the entrance of the harbour, between Blackball Head to the eastward, and Ferry Point.
DROGHEDA	North Crook, at the entrance of the Boyne.
Queenborough	In the river Boyne, opposite Queenborough.
DUBLIN	Pigeon-house, between the harbour light-house and the end of the North Wall.
DUNDALK	Soldiers' Point.
GALWAY	To the eastward, or under the shelter of Mutton Island.
LIMERICK	Tarbert's Roads to the southward of Tarbert Island, in the county of Kerry.
LONDONDERRY	Greencastle, situate on the north side of Lough Foyle.
NEWRY	Warren Point Roads.
Strangford	Ballyheury Bay or Audley's Town Bay.
SLIGO	Oyster Island.
Killibegs	Anchorage of Killibegs.
Ballyshannon	In the river, abreast of Ward Townhouse.
Ballina	Moyne Pool.
Killala	Killala Pool.
WATERFORD, *New Ross*, *Dungarvan*	Passage.
WESTPORT	The harbour.
WEXFORD	The anchorage ground at Annagh Head, in Clew Bay.
	South Bay, about 10 miles from Wexford.

IMPORTS AND EXPORTS, the articles imported into and exported from a country. We have explained in another article (BALANCE OF TRADE) the mode in which the value of the imports and exports is officially determined by the Custom-house, and have shown the fallacy of the common notions as to the advantages of the exports exceeding the imports. The scale of prices according to which the official value of the imports and exports is determined having been fixed so far back as 1698, the account is of no use as showing their true value; but it is of material importance as showing the fluctuations in their quantity. We were anxious, had the means existed, to have given accounts of the quantities of the various articles imported and exported at different periods during the last century, that the comparative increase or diminution of the trade in each might have been exhibited in one general view. Unluckily, however, no means exist for completing such an account. The Tables published by Sir Charles Whit-

Trade of Great Britain with Foreign Countries, since 1760.

Years.	Imports. Official Value.	Exports of British and Foreign and Colonial Produce. Official Value.	Years.	Imports. Official Value.	Exports of British and Foreign and Colonial Produce. Official Value.
	£	£		£	£
1760	10,683,596	15,781,476	1772	14,508,716	17,720,169

An Account of the Value of the Imports into, and of the Exports from the U. Kingdom, during each of the undermentioned Years from 1798 to 1857, both inclusive, calculated at the Official Rates of Valuation, and distinguishing the Amount of the Produce and Manufactures of the U. Kingdom exported from the Value of the Foreign and Colonial Merchandise exported; exhibiting, also, the Real or Declared Value of the Produce and Manufactures of the U. K. annually exported therefrom.

Years.	Value of Imports into the U. Kingdom, at the official Rates of Valuation.	Value of Exports from the U. Kingdom, at the Official Rates of Valuation. Produce and Manufactures of U. Kingdom.	Foreign and Colonial Merchandise.	Total Exports.	Value of Produce and Manufactures of U. K. Exported according to the Real Value thereof.

N. B.—The account of the declared or real value of the exports was first taken in 1798, having been introduced by the Convoy Act of that year.

worth, Mr. Macpherson, and others, specify only the aggregate official value of the imports from and exports to particular countries, without specifying the articles or their values of which such imports and exports consisted. And on applying at the Custom-house, we found that the fire in 1814 had destroyed the records; so that there were no means of compiling any complete account of the value of the articles imported or exported previously to that period. We have, however, given in the preceding tables as complete a view of the trade of Great Britain with all parts of the world, from 1760 down to 1857, both inclusive, as can be derived from existing materials. And the subsequent tables, and those dispersed through the work, give a view of that trade in detail, that is, in particular articles, and with particular countries.

During the first half of last century, and previously, woollen goods formed the principal article of native produce exported from Great Britain; and next to it were hardware and cutlery, leather manufactures, linen, tin and lead, copper and brass manufactures, coal, earthenware, provisions, slops, &c. Corn formed a considerable article in the list of exports down to 1770; since which period the balance of the corn trade has been, with few exceptions, very decidedly on the side of importation. Cotton did not begin to be of any importance as an article of export till after 1770; but since then the extension and improvement of the cotton manufacture has been so great, that the exports of cotton stuffs and yarn amount, at this moment, to about one-third part or more of the entire exports of British produce and manufactures. The value of the exports of iron and other metallic products has also increased with extraordinary rapidity, and they are now, next to cotton stuffs and yarn, the leading articles in the list of exports. The export of woollen goods has latterly been very considerably augmented, after being for a while comparatively stationary.

The principal articles of import during the last half century have consisted of sugar, tea, corn, timber, and naval stores, cotton wool, sheep's wool, woods and drugs for dyeing, wine and spirits, tobacco, silk, tallow, hides and skins, coffee, spices, bullion, &c. Of the colonial and other foreign products imported into England, considerable quantities have always been re-exported.

Decline in the Real Value of the Exports.—The rapid increase in the official, compared with the slow increase in the real, value of the exports since 1815, has given rise to a great deal of irrelevant discussion. It has been looked upon as a proof that our commerce was becoming less prosperous, whereas, in point of fact, a precisely opposite conclusion should be drawn from it. We have already stated (art. Balance of Trade) that the rates according to which the official values of the exports are determined were fixed so far back as 1696, so that they have long ceased to be of importance as affording any criterion of their actual value. To remedy this defect, a plan was formed in 1798 for keeping an account of the real value of the exports as ascertained by the declarations of the exporters. Those who believe that our trade is getting into a bad condition, contend that the great increase in the official value of the exports since 1815 shows that the *quantity* of the articles exported has been proportionally augmented; while the slow increase of their real value shows that we are selling this larger quantity of produce for a proportionally smaller price,—a result which, they affirm, is most injurious. But the circumstance of a manufacturer or merchant selling a large or a small quantity of produce at the same price, affords no criterion by which to judge of the advantage or disadvantage of the sale; for if, in consequence of improvements in the arts or otherwise, a particular article may now be produced for half the expense that its production cost 20 or 30 years ago, it is obvious that double the quantity of it may be afforded for the same price, without injury to the producers. Now this is the case with some of the most important articles exported from England. Cotton and cotton yarn form, as stated above, a third part or more of the entire value of the exports; but since 1815 there has been an extraordinary fall in their price, occasioned partly by the fall in the price of the raw material, but more by the wonderful improvements that have been effected in all departments of the manufacture. (See art. Cotton, *passim.*) And a reduction, to a greater or less extent, proceeding from the like causes, has taken place in the price of other leading articles of export.

A fall having also taken place in the prime cost, and consequently also in the price, of most of the principal articles of import, we obtain, at this moment, a much larger quantity of the produce of other countries in exchange for the articles we send abroad, than at any former period. The fall has been particularly sensible in the great articles of cotton and sheep's wool, corn, sugar, indigo, pepper, &c. The imports of all sorts of foreign merchandise have been increasing rapidly since 1815; and it is material to bear in mind, that we had no gold coin in circulation at that epoch, and that besides the greater quantities of other articles, we have imported in the intervening period, from 80,000,000*l.* to 90,000,000*l.* of gold and silver for currency only. The truth is, therefore, that instead of the decline in the real value of some of our exports having been in any degree prejudicial, it has been, in all respects, distinctly and completely the reverse. It has insured for our goods a decided superiority in every market, while, as the cost of the goods has fallen in an equal degree, their production continues to be equally advantageous. It appears, too, that a similar fall has been going on in other countries; so that while we send more goods to the foreigner, we get back more of his in return. Instead of being an evidence of decline, increased facilities of production and increased cheapness are the most characteristic and least equivocal marks of commercial prosperity.

Account of the Real or Declared Value of the Various Articles of the Manufacture and Produce of the U. Kingdom, exported to Foreign Countries and British Possessions during each of the 5 Years ending with 1857, specifying the Countries to which they were exported, and the Value of those annually Shipped for each; and showing, also, the Average Amount of Exports during the said 5 Years to each Country, and the Average Proportion exported to each, supposing the whole Exports to be 1000.

Countries.	1853.	1854.	1855.	1856.	1857.	Average Annual Amount of Exports, 1853 57.	Average Annual Proportions exported to each Country, supposing the whole Exports to be 1000.

* The computed real value of imports was not ascertained before 1854.

Causes of the Magnitude of British Commerce.—The immediate cause of the rapid increase and vast magnitude of the commerce of Great Britain, is doubtless to be found in the extraordinary improvement, and consequent extension, of our manufactures since 1770. The cotton manufacture may be said to have grown up during the intervening period. It must also be borne in mind, that the effect of an improvement in the production of any article in considerable demand is not confined to that particular article, but extends itself to others. Those who produce it according to the old plan are undersold, unless they adopt the same or similar improvements; and the improved article,

by coming into competition with others for which it may be substituted, infuses new energy into their producers, and impels every one to put forth all his powers, that he may either preserve his old or acquire new advantages. The cotton manufacture may be said to be the result of the stupendous inventions and discoveries of Hargreaves, Arkwright, Crompton, and a few others; but we should greatly under-rate the importance of their inventions, if we supposed that their influence was limited to this single department. They imparted a powerful stimulus to every branch of industry. Their success, and that of Watt and Wedgewood, gave that confidence to genius so essential in all great undertakings. After machines had been invented for spinning and weaving cottons, whose fineness emulates the web of the gossamer, and steam-engines had been made "to engrave seals, and to lift a ship like a bauble in the air," every thing seemed possible — *nil arduum visum est.* And the unceasing efforts of new aspirants to wealth and distinction, and the intimate connection of the various arts and sciences, have extended and perpetuated the impulse given by the invention of the spinning-frame and the steam-engine.

The immense accumulation of capital that has taken place since the close of the American war has been at once a cause and a consequence of our increased trade and manufactures. Those who reflect on the advantages which an increase of capital confers on its possessors can have no difficulty in perceiving how it operates to extend trade. It enables them to buy cheaper, because they buy larger quantities of goods, and pay ready money; and, on the other hand, it gives them a decided superiority in foreign markets, where capital is scarce, and credit an object of primary importance with the native dealers. To the manufacturer, an increase of capital is of equal importance, by giving him the means of constructing his works in the best manner, and of carrying on the business on such a scale as to admit of the most proper distribution of whatever has to be done among different individuals. These effects have been strikingly evinced in the commercial history of Great Britain during the last half century: and thus it is, that capital, originally accumulated by means of trade, gives it, in its turn, nourishment, vigour, and enlarged growth.

The improvement that has taken place in the mode of living during the last half century has been partly the effect, and partly the cause, of the improvement of manufactures, and the extension of commerce. Had we been contented with the same accom-

modations as our ancestors, exertion and ingenuity would long since have been at an end, and routine have usurped the place of invention. Happily, however, the desires of man vary with the circumstances under which he is placed, extending with every extension of the means of gratifying them, till, in highly civilised countries, they become all but illimitable. This endless craving of the human mind, its inability to rest satisfied with previous acquisitions, combined with the constant increase of population, renders the demand for new inventions and discoveries as intense at one period as at another, and provides for the continued advancement of society. What is a luxury in one age, becomes a necessary in the next. The fact of Queen Elizabeth having worn a pair of silk stockings was reckoned deserving of notice by contemporary historians; while, at present, no gentleman, how humble soever his circumstances, can go to dinner without them. The lower classes are continually pressing upon the middle; and these, again, upon the higher; so that invention is racked, as well to vary the modes of enjoyment, as to increase the amount of wealth. That this competition should be, in all respects, advantageous, is not to be supposed. Emulation in show, though the most powerful incentive to industry, may be carried to excess; and has certainly been ruinous to many individuals, obliged sometimes, perhaps, by their situation, or seduced by example, to incur expenses beyond their means. But the abuse, even when most extended, as it probably is in England, is, after all, confined within comparatively narrow limits; while the beneficial influence resulting from the general diffusion of a taste for improved accommodations adds to the science, industry, wealth, and enjoyments of the whole community.

We are also inclined to think that the increase of taxation, during the late war, contributed to the improvement of manufactures, and the extension of trade. The gradually increasing pressure of the public burdens stimulated the industrious portion of the community to make corresponding efforts to preserve their place in society; and produced a spirit of invention and economy that we should have in vain attempted to excite by any less powerful means. Had taxation been very oppressive, it would not have had this effect; but it was not so high as to produce either dejection or despair, though it was, at the same time, sufficiently heavy to render a considerable increase of exertion and parsimony necessary, to prevent it from encroaching on the fortunes of individuals, or, at all events, from diminishing the rate at which they were previously accumulating. To the excitement afforded by the desire of rising in the world, the fear of falling superadded an additional and powerful stimulus; and the two together produced results that could not have been produced by the unassisted operation of either. No evidence has been, or, probably, can be, produced to show that the capital of the country would have been materially greater than it is, had the tranquillity of Europe been maintained uninterrupted from 1793 to the present moment.

We do not state these circumstances to extenuate the evils of war, or of oppressive taxation; but merely to show the real influence of taxation on industry, when gradually augmented and kept within reasonable bounds. Under such circumstances, it has the same influence over a nation that an increase of his family, or of his unavoidable expenses, has over a private individual.

But after every fair allowance has been made for the influence of the causes above stated, and of others of a similar description, still it is abundantly certain that a liberal system of government, affording full scope for the expansion and cultivation of every mental and bodily power, and securing all the advantages of superior talent and address to their possessors, is the grand *sine quâ non* of commercial and manufacturing prosperity. Where oppression and tyranny prevail, the inhabitants, though surrounded by all the means of civilisation and wealth, are invariably poor and miserable. In respect of soil, climate, and situation, Spain is, perhaps, superior, or, at all events, but little inferior to Great Britain; and yet, what a miserable contrast does the former present, when compared with the latter! The despotism and intolerance of her rulers, and the want of good order and tranquillity, have extinguished every germ of improvement in the Peninsula, and sunk the inhabitants to the level of the Turks and Moors. Had a similar political system been established in England, we should have been equally depressed. Our superiority in science, arts, and arms, though promoted by subsidiary means, is, at bottom, the result of *freedom* and *security* — freedom to engage in every employment, and to pursue our own interest in our own way, coupled with an intimate conviction, derived from the nature of our institutions, and their opposition to every thing like arbitrary power, that acquisitions, when made, may be securely enjoyed or disposed of. These form the grand sources of our wealth and power. There have only been two countries — Holland and the U. States — which have, in these respects, been placed under nearly the same circumstances as England; and, notwithstanding they inhabit a

morass, defended only by artificial mounds from being deluged by the ocean, the Dutch have long been, and still continue to be, the most prosperous and opulent people of the Continent; while the Americans, whose situation is more favourable, are advancing in the career of improvement with a rapidity hitherto unknown. In Great Britain we have been exempted, for a lengthened period, from foreign aggression and intestine commotion; the pernicious influence of the feudal system has long been at an end; the same equal burdens have been laid on all classes; we have enjoyed the advantage of liberal institutions, without any material alloy of popular licentiousness or violence; our intercourse with foreign nations, though subjected to various restraints, has been comparatively free; full scope has been given to the competition of the home producers; the highest offices have been open to deserving individuals; and, on the whole, the natural order of things has been less disturbed amongst us by artificial restraints than in most other countries. But without security, no degree of freedom would have been of material importance. Happily, however, every man has felt satisfied, not only of the temporary, but of the permanent tranquillity of the country, and of the stability of its institutions. The plans and combinations of capitalists have not been affected by misgivings as to what might take place in future. Monied fortunes have not been amassed in preference to others, because they might be more easily sent abroad in periods of confusion and disorder; but all individuals have unhesitatingly engaged, whenever an opportunity offered, in undertakings of which a remote posterity was alone to reap the benefit. No one can look at the immense sums expended upon the permanent improvement of the land, on docks, warehouses, canals, &c., or reflect for a moment on the settlements of property in the funds, and the extent of our system of life insurance, without being deeply impressed with the vast importance of that confidence which the public have placed in the security of property and the good faith of government. Had this confidence been imperfect, industry and invention would have been paralysed; and much of that capital which feeds and clothes the industrious classes would never have existed. The preservation of this security entire, both *in fact and in opinion*, is essential to the public welfare. If it be anywise impaired, the colossal fabric of our prosperity will crumble into dust; and the commerce of London, Liverpool, and Glasgow, like that of Tyre, Carthage, and Palmyra, will, at no very remote period, be famous only in history. — (From the *Treatise on Commerce*, contributed by the author of this work to the Society for the Diffusion of Useful Knowledge.)

Supposed Danger to our Trade from Foreign Competition. — A great many statements have been circulated of late years respecting the rapid progress of manufactures in foreign countries, and many sinister auguries have at the same time been indulged in as to the decay of the manufactures and trade of this country. But though all branches of industry, and especially those dependent on foreign supply and demand, are necessarily exposed to vicissitudes which it is impossible to estimate *à priori*, or even to foresee; still we think there are no good grounds on which to anticipate that we are at all likely, within any reasonable period, to be outstripped by others in the career of industry. We have, it is true, something to fear from the spread of combinations and agitation at home; but, supposing domestic security and tranquillity to be preserved, we have little or nothing to fear from foreign competition. The previous tables show that our exports to France, Germany, and Italy, have increased rapidly of late years. And but for their restrictions, which, however, are ten times more injurious to themselves than to those with whom they deal, our exports to the continent would have been vastly increased. But it is impossible that these restrictions should be maintained for any very lengthened period. Their days are numbered, and they cannot be many. In the present state of Europe, and with the intimate intercourse that subsists among its different states, we may safely affirm that monopoly, and its necessary consequences, scarcity and high prices, cannot have a very lengthened existence.

We have occasionally seen statements on which some stress has been laid in regard to the progress of the cotton and other manufactures in the U. States and elsewhere. And we have no doubt that at some future period the Union will be a great manufacturing country. It has every means and every facility for eventually distinguishing itself in that career; but a result of this sort can only be slowly brought about, according as population increases, and as the preponderating advantages now on the side of the ruder species of industry are diminished. And supposing it to have arrived at the destined goal, there are no grounds for supposing that the consequences will be injurious to us. On the contrary, there is every reason to think, seeing the rapid increase of population and wealth in most parts of the world, that there will be "ample room and verge enough" for the fullest display of the manufacturing capacities of every people. But in the meantime and for a long while to come, the Americans

will export few cotton goods, except those coarse fabrics the value of which chiefly consists of that of the raw material. It is, indeed, an absurdity to suppose that a country like the U. States, where labour is comparatively scarce and profits and wages comparatively high, should be able to come into any thing like successful competition with a country like England, in the production of any description of articles requiring either a good deal of skill or of labour in their manufacture.

Establishment of Free Trade. — In the later editions of this work we showed that though much had been done, much remained to be done to carry out to its full extent the liberal and enlightened system of commercial policy on which we had entered. We, also, endeavoured to show that the necessary changes might be made in our corn laws and other restrictive regulations, without seriously imperilling the interests of agriculture, or of any other great department of industry. We confess, however, that we did not anticipate that the triumph of philosophy and sound sense over sophistry and selfishness was so near at hand. But *novus sæclorum nascitur ordo.* The scarcity in Ireland in 1845–46, coupled with the disinterestedness, the patriotism, and the ability of Sir Robert Peel made an end of the corn laws. And with them fell the whole system of protection in this country. A few shreds and patches of the fabric may be found here and there for a longer or a shorter period. But all men of sense saw that the idol had been thrown down without the smallest hope of its ever being again resuscitated; and that free commercial principles were everywhere destined to gain the ascendancy.

One thing only was wanted in 1846, to hasten the downfall of the old system—the experimental and practical success of the new — and that has been afforded in the most ample manner. It would be difficult to exaggerate the advance that has been made in commerce and in most sorts of industry, and the improvement in the condition of society, that has taken place during the last seven years. A considerable portion of this advance is no doubt due to the discovery of the Californian and Australian gold-fields. But that was an incident which might have been turned to an equally good account by France, Spain, or any other country. And if it has been peculiarly advantageous to us and to the Americans, it is because our transatlantic rivals and ourselves were in a situation to profit by it; because our free and untrammelled energies were ready to be directed towards any channel, how remote soever, which held out the promise of an adequate reward.

The moral influence of the new state of things is no less powerful and important than its economical influence. The extension of commerce will do more than anything else to diffuse the blessings of civilisation, to bind together the universal society of nations by sharpening, and at the same time gratifying their mutual wants and desires, and to maintain undisturbed that tranquillity so indispensable to its full development.

IMPRESSMENT, the forcible taking away of seamen from their ordinary employment, and compelling them to serve, against their will, in H. Majesty's ships.

1. *Regulations as to Impressment.* — This practice is not expressly sanctioned by any act of parliament; but it is so indirectly by the numerous statutes that have been passed, granting exemptions from it. According to Lord Mansfield it is "a power founded upon immemorial usage," and is understood to make a part of the common law. All *sea-faring* men are liable to impressment, unless specially protected by custom or statute. Seamen executing particular services for government not unfrequently get protections from the Admiralty, Navy Board, &c. Some are exempted by *local* custom; and *ferrymen* are every where privileged from impressment. The statutory exemptions are numerous.

1. *Every ship in the coal trade* has the following persons protected, viz. 2 able seamen (such as the master shall nominate) for every ship of 100 tons; and 1 for every 50 tons for every ship of 100 tons and upwards; and any officer who presumes to impress any of the above, shall forfeit, to the master or owner of such vessel, 10*l.* for every man so impressed; and such officer shall be incapable of holding any place, office, or employment in any of his Majesty's ships of war.—(6 & 7 *Will.* 3. c. 18. sect. 19.) *

2. *No parish apprentice* shall be compelled or permitted to enter into his Majesty's sea service till he arrives at the age of 18 years. — (2 & 3 *Anne*, c. 6. sect. 4.)

3. Persons *voluntarily* binding themselves apprentices to sea service, shall not be impressed for 3 years from the date of their indentures. But no person above 18 years of age shall have any exemption or protection from his Majesty's service, if they have been at sea before they became apprentices. — (2 & 3 *Anne*, c. 6. sect. 15.; 4 *Anne*, c. 19. sect. 17.; and 13 Geo. 2. c. 17. sect. 2.)

4. *Persons employed in the Fisheries.* — The act 50 Geo. 3. c. 108. grants the following exemptions from impressment, viz.:—

1st. *Masters of fishing vessels* or boats, who, either themselves or their owners, have, or within 6 months before applying for a protection shall have had, 1 apprentice or more under 16 years of age, bound for 5 years, and employed in the business of fishing.

2dly. All such *apprentices*, not exceeding *eight* to every master or owner of any fishing vessel of 50 tons or upwards,; not exceeding *seven* to every vessel or boat of 35 tons and under 50; not exceeding *six* to every vessel of 50 tons and under 35 tons; and not exceeding *four* to every vessel or boat under 30 tons burden during the time of their apprenticeship, and till the age of 20 years; they continuing, for the time, in the business of fishing only.

3dly. *One mariner*, besides the master and apprentices, to every fishing vessel of 10 tons or upwards, employed on the sea-coast, during his continuance in such service.

* In order that these men shall be thus protected, it is necessary for the master *to name them, before they are impressed:* this is to be done by going before the mayor or other chief magistrate of the place, who is to give the master a certificate, in which is contained the names of the particular men whom he thus nominates; and this certificate will be their protection.

4thly. *Any landsman* above the age of 18, entering and employed on board such vessel, from 2 years from his first going to sea; and to the end of the voyage then engaged in, if he so long continue in such service.

An affidavit sworn before a justice of the peace, containing the tonnage of such fishing vessel or boat, the port or place to which she belongs, the name and description of the master, the age of every apprentice, the term for which he is bound, and the date of his indenture, and the name, age, and description of every such mariner and landsmen respectively, and the time of such landsman's first going to sea, is to be transmitted to the Admiralty; who, upon finding the facts correctly stated, grant a separate protection to every individual. In case, however, "*of an actual invasion of these kingdoms or imminent danger thereof,*" such protected persons may be impressed; but except upon such an emergency, any officer or officers impressing such protected persons shall respectively forfeit 20*l.* to the party impressed, if not an apprentice, or to his master if he be an apprentice.—Sects. 2, 3, 4.

5. *General Exemptions.*—All persons 55 years of age and upwards, and under 18 years. Every person being a foreigner, who shall serve in any merchant ship, or other trading vessel, or privateer, belonging to a subject of the crown of Great Britain; and all persons, of what age soever, who shall use the sea; shall be protected for 2 years, to be computed from the time of their first using it.—(13 *Geo.* 2. c. 17.)

6. *Harpooners*, line managers, or boat steerers, engaged in the southern whale fishery, are also protected.—(26 *Geo.* 3. c. 50.)

7. *Mariners employed in the herring fishery* are exempted while actually employed.—(48 *Geo.* 3. c. 110.)

Policy of Impressment.—This practice, so subversive of every principle of justice, is vindicated on the alleged ground of its being absolutely necessary to the manning of the fleet; and if this allegation were really well founded it would be quite sufficient for its justification. But it may be doubted whether such was ever really the case, and, at all events, it is no longer so.

I. The difficulty formerly experienced in manning the fleet at the breaking out of a war, resulted from the sudden demand for a great number of sailors. This, however, has been more an artificial than a real difficulty, and was occasioned by the peace establishment being arranged on too low a scale. Had it been kept up at from a third to a half of the force usually required during war, and made to consist wholly, or almost wholly of thorough-bred seamen, it would have been an easy matter, by taking on board the usual complement of landsmen and marines, to have put the fleet on a war footing without resorting to impressment, or injuring the merchant service by offering high bounties to the men that entered the navy. It was not necessity, but an ill-judged spirit of parsimony, and the adoption of an improper system, that made impressment necessary in bygone times. But the secure asylum afforded to such of our seamen as choose to resort to the ships of the U. States, must, now, were there nothing else to be considered, make an end of impressment in time to come.

II. Apart from these considerations, the change which the introduction of steam has effected in navigation, has made the adoption of a new system alike easy and indispensable. Thorough-bred seamen, or those expert alike in the handling of sails and the manœuvring of ships, are no longer necessary to anything like the same extent as formerly. Ships are now navigated from the engine-room; and a small part only of the crews needs to be expert seamen. What are now mainly required in ships of war are crews thoroughly trained to the management of guns and the sword exercise; and these important qualifications may be attained in the highest perfection by those who can neither go aloft, nor distinguish one rope from another. All that they require are sea-legs, or such a degree of familiarity with the sea that they may be able to keep their footing, and perform their peculiar duties on board, without being annoyed by sickness or otherwise inconvenienced.

And hence the true plan is to keep the sailing ships on the peace establishment always fully manned with thorough-bred seamen, and to train a large proportion, if not the whole, of the army, to the sea as well as to the land service. The marines are equally serviceable at sea and on shore, and why not add largely to their numbers? In this view large bodies of troops might be kept in garrisons or in barracks in seaport towns, who being embarked occasionally in ships of war, instructed in the art of gunnery and the duty of marines, and accustomed to a sea-faring life, would not fail to become a most valuable and efficient description of force.

It may be worth while, perhaps, to mention that a plan similar to that now referred to, appears to have been adopted by Augustus and his successors at the great naval stations of Ravenna and Misenum.* And, however this precedent may apply, there can be no doubt that the course suggested above may be followed with equal facility and advantage. Supposing we had a sea-going militia of 50,000 men, that is 50,000 men having the use of sea-legs and familiar with the practice of gunnery on board ship, and with the ordinary parts of a seaman's duty, we should be able, by withdrawing a part, say a half, of the thorough-bred seamen employed in sailing ships, and distributing them among those impelled by steam, to send to sea the most powerful fleets at the shortest notice and with the least difficulty. The duty of a soldier should no longer be restricted to service on land. He should be a sort of amphibious animal; and be made to exhibit his courage and daring on sea or on shore as circumstances may require. If we adopt a system of this sort we shall do the most which, perhaps, can be done to strengthen our means of defence, and to render our coasts secure against invasion.

For further details and statements in regard to this matter we beg to refer to the very able paper of W. S. Lindsay, Esq., M.P., on the Manning of the Navy. (Papers printed by Command, Sess. 1859.) The subject is discussed in it by one who is equally at home in all that respects its theory and practice.

* Gibbon's Decline and Fall, cap. iv.

INDEMNITY, is where one person secures another from responsibility against any particular event; thus a policy of insurance is a contract of indemnity against any particular loss. Where one person also becomes bail for another, a bond of indemnity is frequently executed; and where a bond or bill of exchange has been lost or mislaid, the acceptor or obligee would not act prudently in paying it, without being secured by a bond of indemnity.

INDIAN RUBBER. See CAOUTCHOUC.

INDIGO (Fr. *Indigo*; Ger. *Indigo*; Sans. *Nili*; Arab. *Neel*; Malay, *Taroom*), the drug which yields the beautiful blue dye known by that name. It is obtained by the maceration in water of certain tropical plants; but the indigo of commerce is almost entirely obtained from leguminous plants of the genus *Indigofera*; that cultivated in India being the *Indigofera tinctoria*; and that in America the *Indigofera anil*. The Indian plant has pinnate leaves and a slender ligneous stem; and when successfully cultivated, rises to the height of 3, 5, and even 6 feet.

It appears pretty certain that the culture of the indigo plant, and the preparation of the drug, have been practised in India from a very remote epoch. It has been questioned, indeed, whether the *indicum* mentioned by Pliny (*Hist. Nat.* lib. xxxv. c. 6.) was indigo, but, as it would seem, without any good reason. Pliny states that it was brought from India; that when diluted it produced an admirable mixture of blue and purple colours (*in diluendo misturam purpuræ cæruleique mirabilem reddit*); and he gives tests by which the genuine drug might be discriminated with sufficient precision. It is true that Pliny is egregiously mistaken as to the mode in which the drug was produced; but there are many examples in modern as well as ancient times, to prove that the possession of an article brought from a distance implies no accurate knowledge of its nature, or of the processes followed in its manufacture. Beckmann (*Hist. of Inventions*, vol. iv. art. *Indigo*) and Dr. Bancroft (*Permanent Colours*, vol. i. pp. 241—252.) have each investigated this subject with great learning and sagacity; and agree in the conclusion that the *indicum* of Pliny was real indigo, and not, as has been supposed, a drug prepared from the *isatis* or woad. At all events, there can be no question that indigo was imported into modern Europe, by way of Alexandria, previously to the discovery of the route to India by the Cape of Good Hope. When first introduced, it was customary to mix a little of it with woad to heighten and improve the colour of the latter; but, by degrees, the quantity of indigo was increased; and woad was, at last, entirely superseded. It is worth while, however, to remark, that indigo did not make its way into general use without encountering much opposition. The *growers of woad* prevailed on several governments to prohibit the use of indigo! In Germany an imperial edict was published in 1654, prohibiting the use of indigo, or "*devil's dye*," and directing great care to be taken to prevent its clandestine importation, "because," says the edict, "the trade in woad is lessened, dyed articles injured, and money carried out of the country!" The magistrates of Nuremberg went further, and compelled the dyers of that city to take an oath once a year not to use indigo; which practice was continued down to a late period. In 1598, upon an urgent representation of the states of Languedoc, at the solicitation of the woad growers, the use of indigo was prohibited in that province; and it was not till 1737, that the dyers of France were left at liberty to dye with such articles, and in such a way, as they pleased.—(*Beckmann*, vol. iv. p. 142.) Let not those who may happen to throw their eyes over this paragraph, smile at the ignorance of their ancestors. — *Mutato nomine, de te fabula narratur.* How much opposition is made in most countries at this moment to the importation of many important articles, for no better reasons than were alleged in the sixteenth century against the importation of indigo!

Indigo is produced in Bengal, and the other provinces subject to the presidency of that name, from the 20th to the 30th degree of north latitude; in the province of Tinnevelly, under the Madras government; in Java; in Luconia, the principal of the Philippine Islands; and in Guatemala, and the Caraccas, in Central America. Bengal is, however, the great mart for indigo; and the quantity produced in the other places is comparatively inconsiderable.

Raynal was of opinion that the culture of indigo had been introduced into America by the Spaniards; but this is undoubtedly an error. Several species of *indigofera* belong to the New World; and the Spaniards used it as a substitute for ink, very soon after the conquest.—(*Humboldt, Essai Politique sur la Nouvelle Espagne*, tom. iii. p. 54. 2d. ed.)

For the first 20 years after the English became masters of Bengal, the culture and manufacture of indigo, now of such importance, was unknown as a branch of British industry; and the exports were but trifling. The European markets were, at this period, principally supplied from America. In 1783, however, the attention of the English began to be directed to this business; and though the processes pursued by them be nearly the same with those followed by the natives, their greater skill, intelligence, and capital give them immense advantages. In their hands, the growth and preparation of indigo has become the most important employment, at least in a commercial point of view, which can be freely carried on in the country.* The indigo made by the natives supplies the internal demand; but a portion of that which is raised by them, with all that is raised by Europeans, is exported.

In the Delta of the Ganges, where the best and largest quantity of indigo is produced, the plant lasts only for a single season, being destroyed by the periodical inundation; but in the dry central and western provinces, one or two *rattoon* crops are obtained; and owing to this circumstance, the latter are enabled to furnish a large supply of reed to the former.

During the 9 years which preceded the opening of the trade with India, in 1814, the annual average produce of indigo in Bengal, for exportation was nearly 5,600,000 lbs. But after the ports were opened, the indigo produced for exportation increased more than a half; the exports during the 16 years ending with 1829–30 being above 7,500,000 lbs. a year. The following statement shows the rate of this increase, taking the average produce of each 4 years:—

	Lbs.		*Lbs.*		*Lbs.*		*Lbs.*
1814, 1815, 1816, 1817	7,040,000	1818, 1819, 1820, 1821	6,000,000	1822, 1823, 1824, 1825	8,000,000	1826, 1827, 1828, 1829	9,000,000

* The culture and preparation of opium is a monopoly.

But it has latterly declined, as is evident from the following

Statement of the Quantities and Value in Rupees of the Indigo shipped from Calcutta in the Years 1856–57 and 1857–8.

	1856–57.		1857–58.

— tons	3,419		tons 3,071	

It deserves to be remarked, that since the opening of the trade, Indian capitalists have betaken themselves to the manufacture of indigo on the European method, and that at present a considerable part of the whole annual produce is prepared by them.

The culture of indigo is very precarious, not only in so far as respects the growth of the plant from year to year, but also as regards the quantity and quality of the drug which the same amount of plant will afford even in the same season. Thus the produce of 1825–26 was 41,000 chests, while that of 1826–7 was but 25,000 chests; and in 1842 the produce was only 79,000 maunds, while that of the following year was no less than 172,249 maunds! The price of indigo in India increased, for a while, in a far greater ratio than the quantity. In 1813–14, the real value of that exported from Calcutta was 1,461,000*l.*; but in 1827–28, although the quantity had increased but 20 per cent., the value rose to 2,920,000*l.* or was about doubled. There was no corresponding rise in the price in Europe, but, on the contrary, a decline: and the circumstance is to be accounted for by the restraints that were then placed on the investment of capital in the production of colonial articles suited to the European market, the consequent difficulty of making remittances from India, and an unnatural flow of capital to the only great article of Indian produce and export that was supposed capable of bearing its application.

The consumption of indigo has varied but little in this country during the last 10 years. This stationary demand, notwithstanding the fall in the price of the drug and the increase of population, is principally to be ascribed to the decreasing use of blue cloth, in the dyeing of which it is principally made use of. Its consumption in France is about as great as in Britain. Besides the exports to Great Britain, France, and the United States, a good deal of Bengal indigo is exported to the ports on the Persian Gulph, whence it finds its way to southern Russia. It is singular that it is not used by the Chinese, with whom blue is a favourite colour. We subjoin

An Account of the Imports and Exports of Indigo into and from the U. K. in each of the 7 Years ending with 1858.

Average for the 7 years - -	13,700 cwts. or 1,534,100 lbs. a year.						

The indigo of Bengal is divided into two classes, called, in commercial language, *Bengal* and *Oude*; the first being the produce of the southern provinces of Bengal and Bahar, and the last that of their northern provinces and of Benares. The first is, in point of quality, much superior to the other. This arose at one time, in a considerable degree, from the practice which prevailed in the northern provinces, of the European planter purchasing the wet fecula from the Ryot or native manufacturer, and completing the processes of curing and drying the drug. This is at present in a great measure discontinued; and the Oude indigo has, in consequence, considerably improved in quality. Its inferiority is probably more the result of soil and climate, than of any difference in the skill with which the manufacture is conducted. The production of indigo in Bengal and Oude is supposed to have amounted at an average of the 10 years ending with 1851 to 121,900 maunds (of 82 lbs. each) a year.

In addition to the indigo raised in Bengal, a very considerable quantity is now raised in Madras; the value of the exports from the latter, in 1856–57 and 1857–58 having amounted to 445,435*l.* and 366,087*l.* The indigo of Madras is not so good as that of Bengal, and brings a less price. Indigo is, also, exported from Java, the Philippine Islands, Central America, and other places. In 1854 the exports from Batavia amounted to 1,077,848 lbs., and, we believe, they have varied but little in the interval. In 1850 the exports from Manilla were estimated at about 450,000 lbs. According to Humboldt 1,800,000 lbs. indigo were exported from Guatemala in 1825. But if so, which is, perhaps, doubtful, its production must have fallen off greatly in the interval. It does not now probably exceed 500,000 lbs. in all Central America. In 1857 our imports of indigo from Central America, inc. Honduras, amounted to only 1,817 cwts., or 203,504 lbs. Indigo is produced in some of the West India islands, but in small quantities.

Good indigo is known by its lightness or small specific gravity, indicating the absence of earthy impurities; by the mass not readily parting with its colouring matter when tested by drawing a streak with it over a white surface; but above all, by the purity of the colour itself. The first quality, estimated by this last test, is called, in commercial language, *fine blue*; then follow *ordinary blue*, *fine purple*, *purple and violet*, *ordinary purple and violet*, *dull blue*, *inferior purple and violet*, *strong copper*, and *ordinary copper*. These distinctions refer to the Bengal indigo only, the Oude being distinguished only into *fine* and *ordinary*. The indigo of Madras, which is superior to that of Manilla, is about equal to ordinary Bengal indigo. The indigo of Java is superior to these.

We subjoin an Account of the Prices of Indigo in London, on the 15th April, 1859.

Of 68,243 cwt. indigo imported into Great Britain in 1857, 54,208 cwt. were from India, 4,384 ditto from United States, 2,638 ditto from New Granada, &c. The duty to which it was formerly subject was repealed in 1845.—(7 *Geo.* 4. c. 48.)

For further information as to indigo, see *Colebrooke's Husbandry of Bengal*, p. 154.; *Milburn's Orient. Com.*; *Wilkinson's Commerce of Bengal*; *Wilson's Review of do.*; evidence of Gillian Maclaine, Esq.; East India Committee, 1830-31, &c.

The fixed capital required in the manufacture of indigo consists of a few vats of common masonry for steeping the plant, and precipitating the colouring matter; a boiling and drying house; and a dwelling house for the planter. These, for a factory of ten pair of vats, capable of producing, at an average, 12,500 lbs. of indigo, worth on the spot about 2,500*l.*, will not cost above 1,500*l.* sterling. The buildings and machinery necessary to produce an equal value in sugar and rum, would probably cost about 4,000*l.* This fact, therefore, without any reference to municipal regulations, affords a ready answer to the question which has been frequently put, why the British planters in India have seldom engaged in the manufacture of sugar.

INK (Du. *Ink, Inkt*; Fr. *Encre*; Ger. *Dinte*; It. *Inchiostro*; Lat. *Atramentum*; Rus. *Tschernilo*; Sp. *Tinta*; Sw. *Blak.*)

"Every liquor or pigment used for writing or printing is distinguished by the name of ink. Common practice knows only black and red. Of black ink there are three principal kinds: 1. Indian ink; 2. Printers' ink; and 3. Writing ink. The Indian ink is used in China for writing with a brush, and for painting upon the soft flexible paper of Chinese manufacture. It is ascertained; as well from experiment as from information, that the cakes of this ink are made of lampblack and size or animal glue, with the addition of perfumes or other substances not essential to its quality as an ink. The fine soot from the flame of a lamp or candle received by holding a plate over it, mixed with clean size from shreds of parchment or glove-leather not dyed, will make an ink equal to that imported. Good printers' ink is a black paint, smooth, and uniform in its composition, of a firm black colour, and possesses a singular aptitude to adhere to paper thoroughly impregnated with moisture.

"Common ink for writing is made by adding an infusion or decoction of the nut-gall to sulphate of iron, dissolved in water. A very fine black precipitate is thrown down, the speedy subsidence of which is prevented by the addition of a proper quantity of gum Arabic. Lampblack is the common material to give the black colour, of which 2½ ounces are sufficient for 16 ounces of the varnish. Vermilion is a good red. They are ground together on a stone with a muller, in the same manner as oil paints. Among the amusing experiments of the art of chemistry, the exhibition of sympathetic inks holds a distinguished place. With these the writing is invisible, until some reagent gives it opacity. These inks have been proposed as the instruments of secret correspondence. But they are of little use in this respect, because the properties change by a few days' remaining on the paper; most of them have more or less of a tinge when thoroughly dry; and none of them resist the test of heating the paper till it begins to be scorched."—(*Nicholson's Dictionary of Chemistry.*)

INKLE, a sort of broad linen tape, principally manufactured at Manchester and some other towns in Lancashire.

INSOLVENCY AND BANKRUPTCY. Insolvency is a term in mercantile law applied to designate the condition of all persons unable to pay their debts according to the ordinary usage of trade. A bankrupt is an insolvent; but persons may be in a state of insolvency without having committed any of the specific acts which bring them under the denomination of bankrupts.

We have, under the article BANKRUPTCY, explained the most important differences in the law as to insolvency and bankruptcy; and have also briefly stated in that article, and in the article CREDIT, some of the alterations which seem to be imperatively required to make these laws more in harmony, than they are at present, with the principles of justice, and more conducive to the interests of commerce and the public advantage. In the present article, therefore, we shall confine ourselves to a summary statement of the proceedings under the existing laws.

Under the bankrupt laws, the creditors have a compulsory authority to avail themselves of the entire possession of their debtor; under the insolvent laws, the debtor himself may make a voluntary surrender of his property for the benefit of his creditors, or his creditors may, on his incarceration, secure his property. From this diversity in the initiative process results the greatest diversity in the ultimate operation of the bankrupt and insolvent acts. The proceedings under a commission of bankruptcy being instituted by the creditors, they lose all future power over the property and person of the debtor after he has obtained his certificate, except in some particular cases; but the proceedings under the Insolvent Act having been commenced, either by himself, as is generally the case, or by the creditors when the insolvent is in custody and enabled to take advantage of the insolvent laws, the insolvent's future property is liable at all times, his person alone being freed. There are exceptions even to the freedom of the insolvent's person from engagements contracted before his application for relief under the law. The modern law as applied to bankruptcy and insolvency has created no little confusion, and the distinction between the two systems seems objectionable, and should be the subject of legislation.

Until the passing of the act 5 & 6 Vict. c. 116., no one could claim the benefit of the laws passed for relief of insolvent debtors, unless he were at the time in gaol under execution. But by this act, where the debts of a party do not exceed 300*l.* he may make a surrender of all his property, and claim protection against arrest; and this, whether he be a trader or not.

If a party owe a sum not exceeding 300*l.*, he may, on giving notice to one fourth in number and value of his creditors in the London Gazette, and in a local newspaper,

petition the Court of Bankruptcy if he have resided 12 months in the London district, or the country commissioner in whose district he may have resided 12 months, for his protection against arrest. The petition must set forth all his debts and credits and property, and any proposal he may have to make for payment; and a protection may be given to his person and property until the party shall appear in court to be finally protected against any process against his person and goods. On the presentation of the petition the property vests in the official assignee of the court, the commisioner in rotation appoints a certain day to examine the party on oath, and if satisfied with the allegations of the petitioner, may make a final order for his protection; provided the debts were not contracted by fraud or breach of trust, or in any action for the breach of the revenue laws, or other causes mentioned in the act. The commissioner may postpone the examination and renew the protection, may order an allowance for the support of the party until the final order, and may punish him for false statements. On the final order, all the estate, present and future, vests in 2 assignees, one of whom is to be chosen by the creditors, the other being the official assignee. The judges and commissioners were empowered to make rules to carry the act into execution, and rules have accordingly been published containing full directions to any party seeking the benefit of the act.

We will now refer to the proceedings under the act for relief of insolvent debtors who are unable to claim the benefit of the act spoken of.

1. *Proceedings under the existing Insolvent Act.*—A special tribunal, called the "Court for Relief of Insolvent Debtors," exists for the purpose of receiving the surrender of property and effects for the benefit of the creditors of insolvents. It consists of a chief and two other commissioners, appointed by the Crown, and is a court of record, with powers similar to those of the superior courts at Westminster, but it cannot award costs, unless in particular cases. The court sits in Portugal-street, or elsewhere as the court may think fit: no fees are taken, except those established by the court. The commissioners also severally make circuits 3 times a year; and attend at the towns and places appointed for insolvents in the country to appear: their judicial powers in the provincial towns are the same as those exercised in the metropolis.

The first step is the insolvent's petition. Any person detained within the walls of any prison upon any process, may, within 14 days after the arrest, petition for discharge. The petition must state the particulars of the first arrest and cause of detainer, and the amount of debts: the prisoner must give notice of his intention to the gaoler, and state that he is willing to vest all his property in the assignee of the court, and pray to be discharged from all demands.

Under this act, any creditor may get the property of a party in custody vested in the provisional assignee by petition, although the prisoner may not himself have applied.

At the time of the petition either by the prisoner or creditor, the court may order all the prisoner's property (except wearing apparel, &c. to the value of 20*l.*) to be vested in the provisional assignee, until his final discharge; and the court may, before the final hearing, discharge the prisoner on bail. Until discharge, the court may order an allowance for the prisoner for his support out of his estate.

The filing of a petition is an act of bankruptcy if issued within 2 months, and the bankruptcy shall divest the property from the provisional assignee; but a bankruptcy is not to prevent the court proceeding under this act so as to get his future property, if the prisoner should under the bankruptcy obtain his certificate.

The voluntary preference of a creditor, by conveyance of money, goods, bills, or other property, after the imprisonment of the petitioner, or before his imprisonment being in insolvent circumstances, is void, provided it were not 3 months before the imprisonment or with a view to petition. No warrant of attorney or execution to be enforced against property after imprisonment.

2. *The Assignees.* — Any time after the filing of the petition, the court appoints assignees from among the creditors, to whom, on their acceptance of the appointment, an assignment is made of the effects of the prisoner. In case of any real estate, the same, within the space of 6 months, must be sold by public auction, in such manner and place as the major part in value of the creditors approve; but when any part of the property is so circumstanced that the immediate sale of it would be prejudicial to the interests of the prisoner, the court may direct the management of such property till it can be properly sold; and if the debts can be paid by mortgage in lieu of sale, the court may give directions for that purpose, and a dividend is to be declared as soon as may be.

Goods in possession and disposal of the insolvent, whereof he is *reputed* owner, are deemed his property; but this does not affect the assignment of any ship or vessel, duly registered according to the 6 Geo. 4. c. 110.

An account upon oath before an officer of the court, or justice of peace, must be made up by the assignees within every 3 months at the furthest; and in case of a balance in hand, a dividend must be forthwith made, of which dividend 30 days' previous notice must be given; and every creditor is allowed to share in the dividend, unless objected to by the prisoner, assignees, or other creditors, in which case the court decides.

The assignees may execute powers which the insolvent might have executed, as the granting of leases, taking lives, transferring public stock or annuities; but they cannot nominate to a vacant ecclesiastical benefice.

The assignees, with the consent of one commissioner, and the major part of the creditors in value, may compound for any debt due to the prisoner; or may submit differences connected with the estate of the insolvent to arbitration.

Dividends payble to creditors, unclaimed for 12 months, are to be paid into court to the credit of the estate of the insolvent: in default of payment of the dividends by the assignees, their goods may be distrained; or, if no distress, they may be imprisoned.

The assignees, in case the insolvent is a beneficed clergyman or curate, are not entitled to the income of the benefice or curacy; but they may obtain a sequestration of the profits for the benefit of creditors. Neither are the assignees entitled to the pay, half-pay, pension, or other emolument of any person who is or has been in the army, navy, or civil service of the government or East India Company; but the court may order, subject to the approval of the heads of public offices, a portion of such pay, half-pay, pension, or emoluments to be set aside towards the liquidation of the debts of the insolvent.

The court may inquire into the conduct of the assignees, on the complaint of the insolvent or any of his creditors; and, in case of malversation, award costs against them.

Assignees who wilfully employ or retain any part of the proceeds of the insolvent's estate, may be charged with interest, at a rate not exceeding 20*l.* per cent. per annum.

3. *Discharge of the Insolvent.* — After the vesting order, the prisoner is within 14 days to prepare a

schedule of all his estate, effects, and debts, with great particularity, and of his past expenditure, and deposit all his books and papers; the court then appoints a time for hearing, and notice of the vesting order is given to all creditors whose debts amount to 5*l*. At the time of the hearing the schedule is examined, and the commissioners examine the prisoner on oath; and any creditor, having given 3 days' notice of intention to do so, may oppose or examine the prisoner: the hearing may be adjourned; affidavits may be made against his discharge in certain cases; the schedules and accounts may be referred for an investigation to an examiner, who may examine on oath; and the expenses may be paid out of insolvent's estate; the prisoner may be at once discharged from custody, or where no cause to the contrary, in not less than 6 months from the filing the petition; but in case of improper dealing with his creditors, or other misdeeds mentioned in the act, he may be detained 3 or 2 years, or the discharge may be conditional on the prisoner performing some engagement. If creditors improperly oppose, the court may make them pay the prisoner's costs. The adjudication is final, unless improperly obtained. Before the prisoner's discharge, he must execute a warrant of attorney to enable creditors to take any future property, and the act contains provisions for enforcing the warrant of attorney at the discretion of the court; so that all his future property may be made available; or if the insolvent become entitled to property not seizable under an execution, the assignees may obtain the assistance of the court to realise it.

The discharge extends to sums payable by annuity; the annuitants being admitted as creditors to the estate of the insolvent, at a fair valuation of their interest.

But the discharge does not extend to any debts due to the Crown, nor for any offence against the revenue laws; nor at suit of any sheriff or other public officer, upon any bail-bond entered into for any person prosecuted for such offence; unless the Treasury certify consent to the discharge.

Insolvents under writ of *capias* or extent, must apply to the Barons of the Exchequer to be discharged.

When the prisoner is not discharged, the court may, on application for that purpose, order the creditor at whose suit he is detained to pay any sum not exceeding 4*s*. weekly; and in default of payment, the prisoner to be liberated.

4. *Future Liabilities of the Insolvent.* — No person, after judgment entered up, is liable to imprisonment for any debt comprised in the schedule, unless the insolvent had entered into any covenant before the insolvency to pay any sum not then capable of valuation.

An insolvent, after his discharge, may, on the application of an assignee to the court, be again examined touching the effects set forth in the schedule; and if he refuse to appear or answer questions, he may be recommitted.

No uncertificated bankrupt, nor any person having had the benefit of the Insolvent Act, can have it a second time within *five years*, unless 3-4ths in number and value of the creditors consent thereto, or unless it appear to the court that the insolvent, since his bankruptcy or discharge, has done his utmost to pay all just demands; and that the debts subsequently incurred have been unavoidable, from inability otherwise to acquire subsistence for himself and family.

Married women are entitled to the benefit of the insolvent act, and may petition the court on executing a special assignment.

The act 1st & 2nd Victoria, prohibits any proceedings under what is called the Lord's Act, 32 G. 2. c. 28.

Statement of the Number of Petitions filed in the Court for Relief of Insolvent Debtors, and of Adjudications made by that Court, during each of the Seven Years ending with 1840.

Years.	Petitions filed.			Adjudications made.

Our next object will be to present a brief exposition of the BANKRUPT LAWS.

BANKRUPTCY. — Blackstone defines a bankrupt — "A trader who secretes himself, or does certain other acts tending to defraud his creditors." But an intention to defraud is not now held to be essential to constitute a bankrupt; who may be either simply an insolvent, or a person who is guilty of certain acts tending to defraud his creditors.

There are, as already observed, some important distinctions between the bankrupt and insolvent laws, not only in their application to different descriptions of individuals, but also in the powers they exercise over the estates of persons subsequently to their being brought under their adjudication. The benefits of the Insolvent Act extend without distinction to every class of persons actually in prison for debt, and in cases before noticed of a debtor not owing 300*l*. to persons not in custody, whereas the benefits of the Bankrupt Act extend to traders only. But persons relieved under a commission of bankruptcy for the first time are for ever discharged from all debts proveable against them, that is to say, from all debts capable of being valued, (though repeated instances have occurred where settlements have been made, or covenants entered into, from the effect of which a bankrupt is not discharged,) and their property from any future liability; whereas, if relieved under the Insolvent Act, their persons only are protected from arrest, while any property they may subsequently acquire continues liable to their creditors till the whole amount of their debts be paid in full. It follows that the Insolvent Act affords, more immediately, personal relief only; while the Bankrupt Act discharges both person and property at once, and even returns the bankrupt a certain allowance out of the produce of his assets, proportioned to good behaviour, and the amount of his dividend.

Having already treated of insolvency, we now proceed to describe the proceedings under a commission of bankruptcy, as regulated by the acts 6 Geo. 4. c. 16., 1 & 2

W. 4. c. 56., 2 & 3 W. 4. c. 114., 5 & 6 W. 4. c. 29., 6 & 7 W. 4. c. 27., 1 & 2 Vict. c. 110., 2 & 3 Vict. c. 29., and 5 & 6 Vict. c. 122.; which are the last general acts on the subject, and by which former statutes have been consolidated, and several important improvements introduced; leaving, however, untouched, many radical defects inherent in this branch of the law. The chief points to be considered, are — 1. The persons who may become bankrupt: 2. Acts constituting bankruptcy; 3. Proceedings of petitioning creditor; 4 Courts of Bankruptcy; 5. Debts provable under the commission; 6. Official assignees; 7. Assignees chosen by creditors; 8. Property under bankruptcy; 9. Examination and liabilities of bankrupt; 10. Payment of a dividend; 11. Certificate and allowance to bankrupt.

1. *Who may become Bankrupt.* — Generally all persons in trade, capable of making binding contracts, whether natural-born subjects, aliens, or denizens, are within the jurisdiction of the bankrupt laws; but the statute expressly includes builders, bankers, brokers, packers, carpenters, scriveners, ship insurers, warehousemen, wharfingers, shipwrights, victuallers; keeper of inns, taverns, hotels, and coffee-houses, dyers, printers, bleachers, fullers, calenderers, cattle or sheep salesmen, factors, agents, livery stable keepers, coach proprietors, carriers, shipowners, auctioneers, apothecaries, market gardeners, cowkeepers, brickmakers, alum makers, lime burners, millers, and all persons who use the trade of merchandise by bargaining, bartering, commission, consignment, and otherwise, and also all persons who seek their living by buying and selling, letting for hire, or by the manufacturing of goods and commodities. Persons who cannot become bankrupt, are graziers, farmers, workmen for hire, labourers, receivers general of taxes, and subscribers to any commercial or trading company established by charter or act of parliament.

A clergyman, unless a trader, cannot be made a bankrupt; nor an attorney, in the common course of his profession; nor an infant, nor a lunatic, nor a married woman, except in those cases where she may be sued and taken in execution for her debts. — (8 *T. R.* 545.)

A single act of buying or selling is not sufficient to make a trader; as a schoolmaster selling books to his scholars only, or a keeper of hounds buying dead horses and selling the skin and bones. — (6 *Moore*, 56.) But the quantity of dealing is immaterial, where an intention to deal generally may be inferred. — (1 *Rose*, 84.) A buyer or seller of land, or any interest in land, is not a trader within the act; and on this principle it has been decided, that a brickmaker selling bricks made in his own field, or the owner of a mine selling minerals from his own quarry, is not liable, because such business is carried on only as a mode of enjoying the profits of a real estate. — (2 *Wils.* 169.)

Traders having privilege of parliament, are subject to the bankrupt laws, and may be proceeded against as other traders; but such persons cannot be arrested or imprisoned, except in cases made felony by the statute.

2. *Acts constituting Bankruptcy.* — In general, any act which is intended to delay or defraud creditors, is an act of bankruptcy; such as a trader concealing himself from his creditors, leaving the country, causing himself to be arrested or his goods taken in execution, or making any fraudulent conveyance, gift, or delivery of his property. A trader keeping house commits an act of bankruptcy, if he give a general order to be denied. So is closing the door, and not admitting persons till ascertained who they are from window, though no actual denial. — (1 *Bar. & Cres.* 54.) But it is no act of bankruptcy if the denial be on Sunday, or at an unseasonable hour of the night, or to prevent interruption at dinner time.

Traders held in prison for any really subsisting debt for the period of 21 days, or who, being arrested, make their escape out of prison or custody, commit acts of bankruptcy. A penalty due to the Crown is a sufficient debt, and the time is computed from the first arrest, where the party lies in prison immediately, and the day of arrest is included, and the whole of the last day.

Filing a petition, in order to take the benefit of the Insolvent Act, is an act of bankruptcy, and a fiat may be issued any time before the petition is heard by the Insolvent Court, or within 2 calendar months.

A trader may make a declaration of his insolvency, signed and attested by an attorney or solicitor, and afterwards to be filed in the Bankrupt Office; and the secretary signing a memorandum thereof, is authority for advertising it in the *Gazette*. Upon this act of bankruptcy no commission can issue, if not within 2 calendar months after such advertisement, and unless such advertisement be within 8 days after filing declaration; and no docket can be struck till 4 days after advertisement, if the commission is to be executed in London, and 8 if in the country. Such declaration of insolvency being concerted between bankrupt and creditor, does not invalidate the commission. A party may subject himself to the bankrupt laws, by refusing to pay, compound, or give security for a debt when summoned, as will be afterwards noticed.

The execution by a trader of any conveyance by deed, of all his estate and effects for the benefit of all his creditors, is not an act of bankruptcy, unless a commission be sued out within 6 months after, provided the deed be attested by an attorney or solicitor, and executed within 15 days after, and notice thereof within 2 months be given in the *Gazette*, and 2 daily newspapers; or, if the trader reside more than 50 miles from London, notice may be given in the *Gazette*, and nearest country newspaper.

3. *Proceedings of Petitioning Creditors.* — A person being a trader, and having committed an act of bankruptcy, the next step in the proceeding is to petition the Lord Chancellor to issue his fiat. No fiat is issued, unless the petitioning creditor's debt, if 1 person or 1 firm, amounts to 50*l.*, two creditors 70*l.*, and 3 or more creditors 100*l.*, and any person who has a security from a bankrupt for a sum not actually due, may, nevertheless, petition for a fiat. The petitioning creditor must make an affidavit before a Master in Chancery, of the truth of his debt, and give bond, if required by the Lord Chancellor, to prove his debt, the trading, and act of bankruptcy.

If a trader have committed no act of bankruptcy, a creditor may summon him before a commissioner in the manner pointed out by the act of 5 & 6 Victoria, cap 122., and compel him to admit the debt and pay or give security to defend an action, or in case of refusal the creditor may treat him as a bankrupt, and make this refusal a ground for a fiat; or if the trader sign an admission of the debt, and shall not within 14 days pay or give security, the same proceeding may be taken; or if a party disobey any order of any court of law or equity in bankruptcy or lunacy for payment of money, the refusal may be made the ground for a fiat. If the debt prove insufficient to support a fiat, the Lord Chancellor, upon the application of another creditor who has proved a sufficient debt, contracted posterior to that of the petitioning creditor, may order the bankruptcy to be proceeded in.

The petitioning creditor proceeds at his own cost until the choice of assignees, when his expenses are paid out of the first money received under the bankruptcy.

Creditors entitled to sue out a fiat against all the partners in a firm, may elect to petition only against 1 or more of such partners; and the commission may be superseded as to 1 or more partners, without affecting its validity as to the other partners.

Creditors who have sued out a fiat compounding with the bankrupt, or receiving more in the pound than other creditors, forfeit the whole of their debt, and whatever gratuity they received, for the benefit of the other creditors, and the Lord Chancellor may either order the commission to be proceeded in or superseded.

4. *Courts of Bankruptcy.*— The courts of bankruptcy now consist of a Court of Review in London, consisting of one judge only, who combines the duties of a vice chancellor in equity and a judge in bankruptcy. The Court of Review controls all the proceedings of minor courts, and adjudicates on all matters of bankruptcy. There is a court in London consisting of 5 commissioners, where the practical business of bankruptcy is performed; these commissioners conduct all the judicial business, and control all the operations of the bankruptcy from the time of the opening the fiat to the winding up of the estate. Their district embraces London and the eastern and southern parts of England. There are 7 other commissioners having courts at Birmingham, Liverpool, Manchester, Leeds, Bristol, Exeter, and Newcastle upon Tyne, and these districts comprehend within the jurisdiction of the commissioners the greater part of the northern and western parts of England. The commissioners have official assignees and registrars attached to each district court.

Let us now proceed with the powers and duties of the commissioners.

Commissioners are empowered to summon persons, examine them on oath, and call for any deeds or documents, necessary to establish the trading and act of bankruptcy; and upon full proof thereof, to adjudge the debtor a bankrupt. Notice of such adjudication must be given in the *Gazette*, and 3 public meetings appointed for the bankrupt to surrender; the last of which meetings to be the 42d day after. A bankrupt refusing to attend at the appointed time may be apprehended; and on refusing to answer any question touching his business or property, may be committed to prison.

By warrant of the commissioners, persons may break open any house, premises, door, chest, or trunk of any bankrupt, and seize on his body or property; and if the bankrupt be in prison or custody, they may seize any property (necessary wearing apparel excepted) in the possession of such bankrupt, or any other person. Authorised by a justice's warrant, premises may be searched not belonging to the bankrupt, on suspicion of property being concealed there; and persons suspected to have any of the bankrupt's property in their possession, refusing to obey the summons of commissioners, or refusing to answer interrogatories, or to surrender documents, without lawful excuse, may be imprisoned. The wife of the bankrupt may be examined, or, on refusal, committed, and the person against whom a fiat is issued on proof of probable cause, for believing that he is about to leave England, may be arrested.

Persons summoned are entitled to their expenses; and those attending, whether summoned or not, to assist the commissioners in their inquiries, are protected from arrest on any civil suit.

5. *Debts proveable under Commission.*— At the 3 meetings appointed by the commissioners, and at every other meeting appointed by them for proof of debts, every creditor may prove his debt by affidavit or by his own oath; incorporated bodies by an agent authorised for the purpose; and one partner may prove on behalf of the firm. Persons living at a distance may prove by affidavit before a Master in Chancery, or if resident abroad, before a magistrate where residing, attested by a public notary, or British minister or consul.

Clerks and servants, to whom the bankrupt is indebted for wages, are entitled to be paid 3 months' wages, and not exceeding 30*l.*, and for the residue they may prove under the commission.

Indentures of apprenticeship are discharged by bankruptcy; but in case a premium has been received, the commissioners may direct a portion of it to be repaid for the use of the apprentice, proportioned to the term of apprenticeship unexpired.

Debts upon bill, bond, note, or other negotiable security, or where credit has been given upon valuable consideration, though not due at the time the act of bankruptcy was committed, are proveable under the commission. Sureties, persons liable for the debts of, or bail for the bankrupt, may prove after having paid such debts, if they have contracted the liability without notice of any act of bankruptcy. Obligee in bottomry or respondentia bonds, and assured in policy of insurance, are admitted to claim; and after loss, to prove as if the loss or contingency had happened before commission had issued against the obligor or insurer. Annuity creditors may prove for the value of their annuities, regard being had to the original cost of such annuities. Persons having securities may have them valued, and prove for the difference. Plaintiffs in any action, having obtained judgment against the bankrupt, may prove for their costs.

When there are mutual debts between the bankrupt and a creditor, they may be set off against each other, and the balance, if in favour of the creditor, is provable against the bankrupt's estate.

Interest may be proved on all bills of exchange and promissory notes over-due at the time of issuing commission, up to the date of the commission.

Proving a debt under the commission bars the right to proceed against the bankrupt by action; and in case the bankrupt be in prison at the suit of a creditor, he cannot prove his debt without first discharging the bankrupt from confinement: but the creditor is not liable for the costs of the action so relinquished by him.

No debt barred by the statute of limitations is proveable under the commission.

6. *Official Assignees.*— An important alteration introduced by Lord Brougham's act, particularly to commercial men, is the appointment of official assignees. They are 12 in number, merchants and traders, resident in the metropolis or vicinity, and there are 4 in each country district except at Exeter, where there are only 3, and at Newcastle upon Tyne 1, and are selected by the Lord Chancellor. They are to act with the assignees chosen by the creditors. All the real and personal estates of the bankrupt, all the monies, stock in the public funds, securities and proceeds of sale, are transferred and vested in the official assignee, subject to the rules, orders, and direction of the Lord Chancellor, or a member of the Court of Bankruptcy. The official assignee gives security for the trust reposed in him; and is required to deposit all monies, securities, &c. in the Bank of England.

The official assignee is neither remunerated by a percentage nor a fixed salary, but a sum is paid to him for his trouble, at the discretion of the commissioners, and proportioned to the estates of the bankrupt and the duties discharged.

7. *Appointment of Assignees by Creditors.*— The official assignee is empowered to act as the sole assignee of the bankrupt's estates and effects until others are chosen by creditors, which must be at the 2d meetings. Every creditor to the amount of 10*l.* who has proved his debt, is eligible to vote; persons may be authorised by letters of attorney to vote, and the choice is made by the major part in value of the creditors: but the commissioners may reject any person they deem unfit; upon which a new choice must be made.

When only 1 or more partners of a firm are bankrupt, a creditor to the whole firm is entitled to vote, and to assent to or dissent from the certificate; but such creditor, unless a petitioning creditor, cannot receive any dividend out of the separate estate, until all the other creditors are paid in full.

Assignees may, with consent of creditors declared at any meeting duly summoned, compound or submit disputes to arbitration, and such reference be made a rule of the Court of Bankruptcy, or they may, with such consent of the creditors, commence suits in equity; but if 1-3d in value of creditors do not attend such meeting, the same powers are granted to assignees, with the consent, in writing, of commissioners.

Assignees to keep a book of account, where shall be entered a statement of all receipts and payments relating to bankrupt's estate, and which may be inspected by any creditor who has proved, and 14 days before any dividend shall be declared, the official assignee shall furnish a debtor and creditor account to the creditor's assignee. Commissioners may summon assignees with their books and papers, before them; and if they refuse to attend, may cause them to be committed till they obey the summons, and the official assignees may be removed at any time by the Lord Chancellor.

An assignee retaining or employing the money of the bankrupt, to the amount of 100*l.* or upwards, for his own advantage, may be charged 20*l.* per cent. interest.

The court is authorised, at the sitting for the last examination, or whenever after it shall think fit, to audit the assignee's accounts, of which audit 21 days' notice must be given in the *Gazette;* which accounts must be delivered on oath, and the commissioners may examine the asssignee touching the truth thereof.

8. *Property under Bankruptcy.* — The official assignee is vested with all the real and personal estate of the bankrupt, and with all such property as may be devised to him, or come into his possession, till the time he obtain his certificate. The commissioners may sell any real property of which the bankrupt is seised, or any estate tail in possession, reversion, or remainder; and the sale is good against the bankrupt, the issue of his body, and against all persons claiming under him after he became bankrupt, or whom he can cut off from any future interest. All property which the bankrupt has in right of his wife passes to the assignee, except such as is settled for her own sole benefit. Any property pledged, or securities deposited, may be redeemed for the benefit of the creditors.

If a bankrupt, being at the time insolvent, convey his land or goods to his children or others (except upon their marriage, or for a valuable consideration), or deliver securities, or transfer debts into other names, such transactions are void, but this does not extend to a *bonâ fide* sale or conveyance: a purchaser is there protected in a transaction with the bankrupt, if he have no notice of an act of bankruptcy.

A landlord after or out of bankruptcy cannot distrain for more than *one year's rent;* but he may prove under the commission for the residue.

The assignee may accept any lease to which the bankrupt is entitled, and his acceptance exonerates the bankrupt from any future liability for rent; or if the assignee decline the lease, and the bankrupt, within 14 days after, deliver the lease to the lessor, he is not liable for rent.

In general, all power which the bankrupt might lawfully execute in the sale and disposition of his property for the benefit of himself, may be executed by the assignee for the benefit of creditors, and the assignees are entitled to all or nearly all the benefits which the bankrupt could have; even a contract to employ a party has been held to pass to his assignees.

The circumstance of a commission appearing in the *Gazette*, and a fair presumption that the person to be affected thereby may have seen the same, is deemed sufficient legal notice of an act of bankruptcy having been committed.

9. *Examination and Liabilities of Bankrupt.* — A bankrupt having, after an act of bankruptcy or in contemplation of bankruptcy, obtained goods on credit on false pretences, is guilty of a misdemeanor, and a bankrupt not surrendering to the commissioners before 3 o'clock upon the 42d day after notice, or not making discovery of his estate and effects, not delivering up goods, books, papers, &c., or removing or embezzling to the value of 10*l.*, is guilty of *felony*, and liable to a discretionary punishment from imprisonment to transportation for life. The period for surrendering may be enlarged by the Lord Chancellor; and the commissioners, or assignees with approval of commissioners, may grant an allowance for support of the bankrupt and his family till he has passed his last examination. During his attendance on commissioners, the bankrupt is protected from arrest.

The bankrupt is required to deliver up his books of account to the assignees upon oath, and to attend them on reasonable notice; he may inspect his accounts, assisted by other persons, in presence of assignees. After certificate is allowed, he is required to attend assignees, in settling accounts, at 5*s.* per day; and may be committed for non-attendance.

A penalty of 100*l.* is imposed on persons concealing bankrupt's effects, and double the value of the property so concealed; and an allowance of 5*l.* per cent. to persons discovering such concealment, with such further reward as the major part of the creditors may think fit to grant.

The bankrupt, or any other person, wilfully swearing falsely, is liable to the penalties of perjury.

If the bankrupt shall not, if in the U. Kingdom at the time of adjudication, within 21 days after advertisement in the *Gazette*, or within 3 months after advertisement if in any other part of Europe at the date of the adjudication, or if elsewhere at this date, within 12 months after advertisement, dispute the fiat, the gazette to be conclusive.

At any meeting of creditors, after the last examination, the bankrupt or his friends may *tender a composition;* which, if accepted by 9-10ths in number and value of the creditors, at 2 separate meetings, the Lord Chancellor may supersede the commission. In deciding on such offer, creditors under 20*l.* are not entitled to vote; but their debts are computed in value. Persons residing out of England may vote by letter of attorney, properly attested; and the bankrupt may be required to make oath that no unfair means have been employed to obtain the assent of any creditor to such arrangement.

10. *Payment of a Dividend.* —The court, acting in the prosecution of any fiat, may declare a dividend at any time after the time for the last examination of the bankrupt, but 21 days' notice of the meeting to declare it must be regularly advertised; at which meeting, creditors who have not proved may prove their debts; and at such meeting commissioners may order the nett produce of bankrupt's estate to be shared among the creditors that have proved, in proportion to their debts; but no dividend to be declared unless the accounts of the assignees have been first audited and delivered in as before described.

If the estate is not wholly divided upon a first dividend, a second meeting must be called, not later than 18 months from the date of commission; and the dividend declared at such second meeting to be final, unless some suit at law be pending, or some part of bankrupt's property afterwards accrue to the assignees; in which case it must be shared among the creditors within 2 months after it is converted into money; but this may be controlled by the court.

Assignees having unclaimed dividends to the amount of 20*l.*, who do not within 3 calendar months from the expiration of a year from the order of payment of such dividends, either pay them to the creditors entitled thereto, or cause a certificate thereof to be filed in the Bankrupt Office, with the names, &c. of the parties to whom due, shall be charged with legal interest from the time the certificate ought to have been filed, and such further sum, not exceeding 20*l.* per cent. per annum, as the commissioners think fit. The Lord Chancellor may order the investment of unclaimed dividends in the funds; and the unclaimed dividends now are resorted to for the payment of salaries and expenses of the court. Any creditor claiming dividends due to him may obtain them upon application; but unless the dividend be considerable, the expense of the application is too great to render the attempt to obtain it prudent.

No action can be brought against assignees for any dividend; the remedy being by petition to the Lord Chancellor.

11. *Certificate and Allowance to Bankrupt.* — The bankrupt who has surrendered, and conformed in all things to the provisions of the bankrupt laws, is discharged by the certificate from all debts and demands proveable under the commission; but this does not discharge his partner, or one jointly bound, or in joint contract with him, nor does it debar a debt due to the Crown.

The creditors now do not sign the bankrupt's certificate; the mode of obtaining it is for the bankrupt to apply to the court acting in the fiat, to appoint a sitting for the allowance of the certificate, of which 21 days' notice shall be advertised in the *Gazette*, and at this sitting the creditors may be heard against the allowance; and the court, having regard to the conduct of the bankrupt before and after the bankruptcy, may either allow, or refuse, or suspend the allowance of the certificate. The allowance is to be of no force, if the court under hand and seal don ot certify to the Court of Review that the bankrupt has conformed to the law, and made a full discovery of his estate and effects. and that there appears no reason to doubt the truth of such discovey, and unless the bankrupt swear that the certificate was obtained fairly, and unless the allowance be confirmed by the Court of Review.

A bankrupt, after obtaining his certificate, cannot be arrested for any debt proveable under the com-

mission; nor is he liable to satisfy any debt from which he is discharged, upon any promise, contract, or agreement, unless made in writing.

In case a person has been bankrupt before, or compounded with his creditors, or taken benefit of Insolvent Act, unless the estate produced 15*s.* in the pound, the certificate only protects the person of bankrupt from arrest; and any future property he acquires may be seized by assignees for benefit of creditors.

If the produce of bankrupt's estate does not amount to 10*s.* in the pound, he is only allowed out of the assets, so much as assignees think fit, not exceeding 3 per cent., or 300*l.* in the whole; if it produce 10*s.*, 5 per cent., not exceeding 400*l.*; if 12*s.* 6*d.* is paid in the pound, 7½ per cent., not exceeding 500*l.*; if 15*s.* in the pound and upwards, 10 per cent., and not exceeding 600*l.* One partner may receive his allowance, if entitled, from the joint and his separate estate, though the others are not entitled.

A bankrupt is not entitled to certificate or allowance, if he has lost by gaming or wagering, in 1 day, 20*l.*, or within 1 year next preceding his bankruptcy, 200*l.*; or 200*l.* by stock-jobbing in the same period; or, in contemplation of bankruptcy, has destroyed or falsified his books, or concealed his property; or, if any person having proved a false debt under the commission, such bankrupt being privy thereto, or afterwards knowing the same, has not disclosed it to his assignees within 1 month after such knowledge.

Lastly, upon request by the bankrupt, the official assignee is required to declare to him how he has disposed of his property, and account to him for the surplus, if any: but before any surplus can be admitted, interest must be paid, first, on all debts proved that carry interest, at the rate payable thereon; and next, upon all other debts at the rate of 4*l.* per cent., to be calculated from the date of the commission.

Account of the Number and Description of Persons who became Bankrupt, in England and Wales, between the 1st of November, 1841, and the 1st of November, 1842.

Total bankrupts in England and Wales, 1573.

INSURANCE, a contract of indemnity, by which one party engages, for a stipulated sum, to insure another against a risk to which he is exposed. The party who takes upon him the risk, is called the *Insurer*, *Assurer*, or *Underwriter*; and the party protected by the insurance is called the *Insured*, or *Assured*; the sum paid is called the *Premium*; and the instrument containing the contract is called the *Policy*.

I. Insurance (General Principles of).
II. Insurance (Marine).
III. Insurance (Fire).
IV. Insurance (Life).

I. Insurance (General Principles of).

It is the duty of government to assist, by every means in its power, the efforts of individuals to protect their property. Losses do not always arise from accidental circumstances, but are frequently occasioned by the crimes and misconduct of individuals; and there are no means so effectual for their prevention, when they arise from this source, as the establishment of a vigilant system of police, and of such an administration of the law as may be calculated to afford those who are injured a ready and cheap method of obtaining every practicable redress; and, as far as possible, of insuring the punishment of culprits. But, in despite of all that may be done by government, and of the utmost vigilance on the part of individuals, property must always be exposed to a variety of casualties from fire, shipwreck, and other unforeseen disasters. And hence the importance of inquiring how such unavoidable losses, when they do occur, may be rendered least injurious.

The loss of a ship, or the conflagration of a cotton mill, is a calamity that would press heavily even on the richest individual. But were it distributed among several individuals, each would feel it proportionally less; and provided the number of those among

whom it was distributed were very considerable, it would hardly occasion any sensible inconvenience to any one in particular. Hence the advantage of combining to lessen the injury arising from the accidental destruction of property: and it is the diffusion of the risk of loss over a wide surface, and its valuation, that forms the employment of those engaged in insurance.

Though it be impossible to trace the circumstances which occasion those events that are, on that account, termed accidental, they are, notwithstanding, found to obey certain laws. The number of births, marriages, and deaths; the proportions of male to female, and of legitimate to illegitimate births; the ships cast away; the houses burned; and a vast variety of other apparently accidental events; are yet, when our experience embraces a sufficiently wide field, found to be nearly equal in equal periods of time: and it is easy, from observations made upon them, to estimate the sum which an individual should pay, either to guarantee his property from risk, or to secure a certain sum for his heirs at his death.

It must, however, be carefully observed, that no confidence can be placed in such estimates, unless they are deduced from a very wide induction. Suppose, for example, it happens that during the present year one house is accidentally burned, in a town containing 1,000 houses; this would afford very little ground for presuming that the *average* probability of fire in that town was 1 to 1,000. For it might be found that not a single house had been burned during the previous 10 years, or that 10 were burned during each of these years. But supposing it were ascertained, that, at an average of 10 years, 1 house had been annually burned, the presumption that 1 to 1,000 was the real ratio of the probability of fire would be very much strengthened; and if it were found to obtain for 20 or 30 years together, it might be held, for all practical purposes at least, as indicating the precise degree of probability.

Besides its being necessary, in order to obtain the true measure of the probability of any event, that the series of events, of which it is one, should be observed for a rather lengthened period, it is necessary also that the events should be numerous, or of pretty frequent occurrence. Suppose it were found, by observing the births and deaths of 1,000,000 individuals taken indiscriminately from among the whole population, that the mean duration of human life was 40 years; we should have but very slender grounds for concluding that this ratio would hold in the case of the next 10, 20, or 50 individuals that are born. Such a number is so small as hardly to admit of the operation of what is called the *law of average*. When a large *number of* lives is taken, those that exceed the medium term are balanced by those that fall short of it; but when the number is small, there is comparatively little room for the principle of compensation, and the result cannot, therefore, be depended upon.

It is found, by the experience of all countries in which censuses of the population have been taken with considerable accuracy, that the number of male children born is to that of female children in the proportion nearly of 22 to 21. But unless the observations be made on a very large scale, this result will not be obtained. If we look at particular families, they sometimes consist wholly of boys, and sometimes wholly of girls; and it is not possible that the boys can be to the girls of a single family in the ratio of 22 to 21. But when, instead of confining our observations to particular families, or even parishes, we extend them so as to embrace a population of 500,000, these discrepancies disappear, and we find that there is invariably a small excess in the number of males born over the females.

The false inferences that have been drawn from the doctrine of chances, have uniformly, almost, proceeded from generalising too rapidly, or from deducing a rate of probability from such a number of instances as do not give a fair average. But when the instances on which we found our conclusions are sufficiently numerous, it is seen that the most anomalous events, such as suicides, deaths by accidents, the number of letters put into the post-office without any address, &c., form pretty regular series, and consequently admit of being estimated *à priori*.

The business of insurance is founded upon the principles thus briefly stated. Suppose it has been remarked that of *forty* ships, of the ordinary degree of sea-worthiness, employed in a given trade, 1 is annually cast away, the probability of loss will plainly be equal to *one fortieth*. And if an individual wish to insure a ship, or the cargo on board a ship, engaged in this trade, he ought to pay a *premium* equal to the 1-40th part of the sum he insures, exclusive of such an additional sum as may be required to indemnify the insurer for his trouble, and to leave him a fair profit. If the premium exceed this sum, the insurer is overpaid; and if it fall below it, he is underpaid.

Insurances are effected sometimes by societies, and sometimes by individuals, the risk being in either case diffused amongst a number of persons. Companies formed for carrying on the business have generally a large subscribed capital, or such a number of proprietors as enables them to raise, without difficulty, whatever sums may at any time be required to make good losses. Societies of this sort do not limit their risks to small

sums; that is, they do not often refuse to insure a large sum upon a ship, a house, a life, &c. The magnitude of their capitals affords them the means of easily defraying a heavy loss; and their premiums being proportioned to their risks, their profit is, at an average, independent of such contingencies.

Individuals, it is plain, could not act in this way, unless they were possessed of very large capitals; and besides, the taking of large risks would render the business so hazardous, that few would be disposed to engage in it. Instead, therefore, of insuring a large sum, as 20,000*l.*, upon a single ship, a private underwriter or insurer may not, probably, in ordinary cases, take a greater risk than 200*l.* or 500*l.*; so that, though his engagements may, when added together, amount to 20,000*l.*, they will be diffused over from 40 to 100 ships; and supposing 1 or 2 ships to be lost, the loss would not impair his capital, and would only lessen his profits. Hence it is, that while one transaction only may be required in getting a ship insured by a company, 10 or 20 separate transactions may be required in getting the same thing done at Lloyd's, or by private individuals. When conducted in this cautious manner, the business of insurance is as safe a line of speculation as any in which individuals can engage.

To establish a policy of insurance on a fair foundation, or in such a way that the premiums paid by the insured shall exactly balance the risks incurred by the insurers, and the various necessary expenses to which they are put, including, of course, their profit, it is necessary, as previously remarked, that the experience of the risks should be pretty extensive. It is not, however, at all necessary, that either party should inquire into the circumstances that lead to those events that are most commonly made the subject of insurance. Such a research would, indeed, be entirely fruitless: we are, and must necessarily continue to be, wholly ignorant of the causes of their occurrence.

It appears, from the accounts given by Mr. Scoresby, in his valuable work on the Arctic Regions, that of 586 ships which sailed from the various ports of Great Britain for the northern whale fishery, during the 4 years ending with 1817, 8 were lost — (vol. ii. p. 131.), — being at the rate of about 1 ship out of every 73 of those employed. Now, supposing this to be about the average loss, it follows that the premium required to insure against it should be 1*l.* 7*s.* 4*d.* per cent., exclusive, as already observed, of the expenses and profits of the insurer. Both the insurer and the insured would gain by entering into a transaction founded on this fair principle. When the operations of the insurer are extensive, and his risks spread over a considerable number of ships, his profit does not depend upon chance, but is as steady, and may be as fairly calculated upon, as that of a manufacturer or a merchant; while, on the other hand, the individuals who have insured their property have exempted it from any chance of loss, and placed it, as it were, in a state of absolute security.

It is easy, from the brief statement now made, to perceive the immense advantage resulting to navigation and commerce from the practice of marine insurance. Without the aid that it affords, comparatively few individuals would be found disposed to expose their property to the risk of long and hazardous voyages; but by its means insecurity is changed for security, and the capital of the merchant, whose ships are dispersed over every sea, and exposed to all the perils of the ocean, is as secure as that of the agriculturist. He can combine his measures and arrange his plans as if they could no longer be affected by accident. The chances of shipwreck, or of loss by unforseen occurrences, enter not into his calculations. He has purchased an exemption from the effects of such casualties; and applies himself to the prosecution of his business with that confidence and energy which nothing but a feeling of security can inspire. "Les chances de la navigation entravaient le commerce. Le système des assurances a paru; il a consulté les saisons; il a porté ses regards sur la mer; il a interrogé ce terrible élément; il en a jugé l'inconstance; il en a pressenti les orages: il a épié la politique: il a reconnu les ports et les côtes des deux mondes; il a tout soumis à des calculs savans, à des théories approximatives; et il a dit au commerçant habile, au navigateur intrépide: certes, il y a des désastres sur lesquels l'humanité ne peut que gémir; mais quant à votre fortune, allez, franchissez les mers, déployez votre activité et votre industrie; je me charge de vos risques. Alors, Messieurs, s'il est permis de le dire, les quatre parties du monde se sont rapprochées. — (*Code de Commerce, Exposé des Motifs*, liv. ii.)

Besides insuring against the perils of the sea, and losses arising from accidents caused by the operation of natural causes, it is common to insure against enemies, pirates, thieves, and even the fraud, or, as it is technically termed, *barratry*, of the master. The risk arising from these sources of casualty being extremely fluctuating and various, it is not easy to estimate it with any considerable degree of accuracy; and nothing more than a rough average can, in most cases, be looked for. In time of war, the fluctuations in the rates of insurance are particularly great: and the intelligence that an enemy's squadron, or even a single privateer, is cruising in the course which the ships bound to or returning from any given port usually follow, causes an instantaneous rise in the premium. The appointment of convoys for the protection of trade during war, necessarily tends, by

lessening the chances of capture, to lessen the premium on insurance. Still, however, the risk in such periods is, in most cases, very considerable; and as it is liable to change very suddenly, great caution is required on the part of the underwriters.

Provision may also be made, by means of insurance, against loss by fire, and almost all the casualties to which property on land is subject.

But, notwithstanding what has now been stated, it must be admitted, that the advantages derived from the practice of insuring against losses by sea and land are not altogether unmixed with evil. The security which it affords tends to relax that vigilant attention to the protection of property which the fear of its loss is sure otherwise to excite. This, however, is not its worst effect. The records of our courts, and the experience of all who are largely engaged in the business of insurance, too clearly prove that ships have been repeatedly sunk, and houses burned, in order to defraud the insurers. In despite, however, of the temptation to inattention and fraud which is thus afforded, there can be no doubt that, on the whole, the practice is, in a public as well as private point of view, decidedly beneficial. The frauds that are occasionally committed raise, in some degree, the rate of insurance. Still it is exceedingly moderate; and it is most probable, that the precautions adopted by the insurance offices for the prevention of fire, especially in great towns, where it is most destructive, outweigh the chances of increased conflagration arising from the greater tendency to carelessness and crime.

The business of life insurance has been carried to a far greater extent in Great Britain than in any other country, and has been productive of the most beneficial effects. Life insurances are of various kinds. Individuals without any very near connections, and possessing only a limited fortune, are sometimes desirous, or are sometimes, from the necessity of their situation, obliged, annually to encroach on their capitals. But should the life of such persons be extended beyond the ordinary term of existence, they might be totally unprovided for in old age; and to secure themselves against this contingency, they pay to an insurance company the whole or a part of their capital, on condition of its guaranteeing them, as long as they live, a certain annuity, proportioned partly, of course, to the amount of the sum paid, and partly to their age when they buy the annuity.

But though sometimes serviceable to individuals, it may be questioned whether insurances of this sort are, in a public point of view, really advantageous. So far as their influence extends, its obvious tendency is to weaken the principle of accumulation; to stimulate individuals to consume their capitals during their own life, without thinking or caring about the interest of their successors. Were such a practice to become general, it would be productive of the most extensively ruinous consequences. The interest which most men take in the welfare of their families and friends affords, indeed, a pretty strong security against its becoming injuriously prevalent. There can, however, be little doubt that this selfish practice may be strengthened by adventitious means; such, for example, as the opening of government loans in the shape of life annuities, or in the still more objectionable form of tontines. But when no extrinsic stimulus of this sort is given to it, there do not seem to be any very good grounds for thinking that the sale of annuities by private individuals or associations can materially weaken the principle of accumulation.

Luckily, however, the species of insurance now referred to is but inconsiderable compared with that which has accumulation for its object. All professional persons, or those living on salaries or wages, such as lawyers, physicians, military and naval officers, clerks in public or private offices, &c., whose incomes must, of course, terminate with their lives, and a host of others, who are either not possessed of capital, or cannot dispose of their capital at pleasure, must naturally be desirous of providing, so far as they may be able, for the comfortable subsistence of their families in the event of their death. Take, for example, a physician or lawyer, without fortune, but making, perhaps, 1,000*l.* or 2,000*l.* a year by his business; and suppose that he marries and has a family: if this individual attain to the average duration of human life, he may accumulate such a fortune as will provide for the adequate support of his family at his death. But who can presume to say that such will be the case? — that he will not be one of the many exceptions to the general rule? — And suppose that he were hurried into an untimely grave, his family would necessarily be destitute. Now, it is against such calamitous contingencies that life insurance is intended chiefly to provide. An individual possessed of an income terminating at his death, agrees to pay a certain sum annually to an insurance office; and this office binds itself to pay to his family, at his death, a sum equivalent, under deduction of the expenses of management and the profits of the insurers, to what these annual contributions, accumulated at compound interest, would amount to, supposing the insured to reach the common and average term of human life. Though he were to die the day after the insurance has been effected, his family would be as amply provided for as it is likely they would be by his accumulations were his life of the ordinary duration. In all cases, indeed, in which those insured die before attaining to an average age, their gain is obvious. But even in those cases in which their lives

are prolonged beyond the ordinary term, they are not losers — they then merely pay for a security which they must otherwise have been without. During the whole period, from the time when they effect their insurances, down to the time when they arrive at the mean duration of human life, they are protected against the risk of dying without leaving their families sufficiently provided for; and the sum which they pay after having passed this mean term is nothing more than a fair compensation for the security they previously enjoyed. Of those who insure houses against fire, a very small proportion only have occasion to claim an indemnity for losses actually sustained; but the possession of a security against loss in the event of accident, is a sufficient motive to induce every prudent individual to insure his property. The case of life insurance is in no respect different. When established on a proper footing, the extra sums which those pay whose lives exceed the estimated duration is but the value of the previous security.

In order so to adjust the terms of an insurance that the party insuring may neither pay too much nor too little, it is necessary that the probability of his life failing in each subsequent year should be determined with as much accuracy as possible.

To ascertain this probability, various observations have been made in different countries and periods, showing, out of a given number of persons born in a particular country or place, how many complete each subsequent year and how many die in it, till the whole be extinct. The result of such observations, when collected and arranged in a tabular form, are called Tables of Mortality; being entitled, of course, to more or less confidence, according to the number and species of lives observed; the period when, and the care with which, the observations were made, &c. But, supposing these Tables to be formed with sufficient accuracy, the expectation of life at any age, or its mean duration after such age, may be readily learned from them; and hence, also, the value of an annuity, or an assurance on a life of any age. Thus, in the Table of Mortality for Carlisle, framed by Mr. Milne, of the Sun Life Office, and which is believed to represent the average law of mortality in England with very considerable accuracy, out of 10,000 persons, born together, 4,000 complete their 56th year; and it further appears, that the number of such persons who die in their 66th year is 124; so that the probability that a life now 56 years of age will terminate in the 10th year hence is $\frac{124}{4,000}$. But reckoning interest at 4 per cent., it appears (Table II. Interest and Annuities), that the present value of 100*l.* to be received 10 years hence is 67·556*l.*; consequently, if its receipt be made to depend upon the probability that a life now 56 years of age will fail in the 66th year, its present value will be reduced by that contingency to $\frac{124 \times 67{\cdot}566l.}{4,000} = 2{\cdot}094l.$, or 2*l.* 1*s.* 10½*d.* The present value of 100*l.* receivable upon the life of a party now 56 years of age terminating in the 57th or any subsequent year of his life, up to its extreme limit (which, according to the Carlisle Table, is the 105th year), being calculated in this way, the sum of the whole will be the present value of 100*l.* receivable whenever the life may fail, that is, of 100*l.* insured upon it, supposing no additions were made to it for the profits and expenses of the insurers.

More compendious processes are resorted to for calculating Tables of insurances at all ages; but the above statement sufficiently illustrates the principle on which they all depend. In practice, a life insurance is seldom made by the payment of a single sum when it is effected, but almost always by the payment of an *annual premium* during its continuance, the first being paid down at the commencement of the insurance.* If the Table of Mortality adopted by the insurers fairly represent the law of mortality prevailing among the insured, it follows that when a party insured does not attain to the average age according to the Table, the insurers will either lose by him, or realise less than their ordinary profit; and when, on the other hand, the life of an insured party is prolonged beyond the tabular average, the profits of the insurers are proportionally increased. But if their business be so extensive as to enable the law of average fully to apply, what they lose by premature death will be balanced by the payments received from those whose lives are prolonged beyond the mean duration of life for the ages at which they were respectively insured; so that the profits of the society will be wholly independent of chance.

The relief from anxiety afforded by life insurance very frequently contributes to prolong the life of the insured, at the same time that it materially augments the comfort and well-being of those dependent on him. It has, also, an obvious tendency to strengthen habits of accumulation. An individual who has insured a sum on his life, would forfeit all the advantages of the insurance, were he not to continue regularly to make his annual payments. It is not, therefore, optional with him to save a sum from his ordinary expenditure adequate for this purpose. He is compelled, under a heavy penalty, to do so; and having thus been led to contract a habit of saving to a certain extent, it is most probable that the habit will acquire additional strength, and that he will either insure an additional sum, or privately accumulate.

* For the method of calculating these annual premiums, see *post*, Interest and Annuities.

The practice of marine insurance, no doubt from the extraordinary hazard to which property at sea is exposed, seems to have long preceded insurances against fire and upon lives. We are ignorant of the precise period when it began to be introduced; but it appears most probable that it dates from the end of the fourteenth or the beginning of the fifteenth century. It has, however, been contended by Loccenius (*De Jure Maritimo*, lib. ii. c. 1.), Puffendorff (*Droit de la Nature et des Gens*, lib. v. c. 9.), and others, that the practice of marine insurance is of much higher antiquity, and that traces of it may be found in the history of the Punic wars. Livy mentions, that during the second of these contests, the contractors employed by the Romans to transport ammunition and provisions to Spain, stipulated that government should indemnify them against such losses as might be occasioned by the enemy, or by tempests, in the course of the voyage. — (*Impetratum fuit, ut quæ navibus imponerentur ad exercitum Hispaniensem deferenda, ab hostium tempestatisque vi, publico periculo essent.* — Hist. lib. xxiii. c. 49.) Malynes (*Lex Mercatoria*, 3d ed. p. 105.), founding on a passage in Suetonius ascribes the first introduction of insurance to the emperor Claudius, who, in a period of scarcity at Rome, to encourage the importation of corn, took upon himself all the loss or damage it might sustain in the voyage thither by storms and tempests. — (*Negotiatoribus certa lucra proposuit, suscepto in se damno, si cui quid per tempestates accidisset, et naves mercaturæ causâ, fabricantibus, magna commoda constituit.* — c. 18.) It is curious to observe that this stipulation gave occasion to the commission of acts of fraud, similar to those so frequent in modern times. Shipwrecks were pretended to have happened, that never took place; old shattered vessels, freighted with articles of little value, were purposely sunk, and the crew saved in boats: large sums being then demanded as a recompence for the loss. Some years after, the fraud was discovered, and some of the contfactors were prosecuted and punished. — (Lib. xxv. c. 3.) But none of these passages, nor a similar one in Cicero's letters — (*Ad Fam.* lib. ii. c. 17.), warrant the inferences that Loccenius, Malynes, and others have attempted to draw from them. Insurance is a contract between two parties; one of whom, on receiving a certain premium (*pretium periculi*), agrees to take upon himself the risk of any loss that may happen to the property of the other. In ancient no less than in modern times, every one must have been desirous to be exonerated from the chance of loss arising from the exposure of property to the perils of the sea. But though, in the cases referred to, the carriers were exempted from this chance, they were not exempted by a contract *propter aversionem periculi*, or by an insurance; but by their employers taking the risk upon themselves. And it is abundantly obvious that the object of the latter in doing this was not to profit, like an insurer, by dealing in risks, but to induce individuals the more readily to undertake the performance of an urgent public duty.

But with the exception of the instances now mentioned, nothing bearing the remotest resemblance to an insurance is to be met with till a comparatively recent period. If we might rely on a passage in one of the Flemish chroniclers, quoted by the learned M. Pardessus — (see his excellent work, *Collection des Loix Maritimes*, tome i. p. 356.), we should be warranted in concluding that insurances had been effected at Bruges so early as the end of the thirteenth century: for the chronicler states that, in 1311, the Earl of Flanders consented, on a requisition from the inhabitants, to establish a chamber of insurance at Bruges. M. Pardessus is not, however, inclined to think that this statement should be regarded as decisive. It is evident, from the manner in which the subject is mentioned, that the chronicler was not a contemporary; and no trace can be found, either in the archives of Bruges, or in any authentic publication, of any thing like the circumstance alluded to. The earliest extant Flemish law as to insurance is dated in 1537; and none of the early maritime codes of the North so much as alludes to this interesting subject.

Beckmann seems to have thought that the practice of insurance originated in Italy in the latter part of the fifteenth or the early part of the sixteenth century. — (*Hist. of Invent.* vol. i. art. *Insurance.*) But the learned Spanish antiquary, Don Antonio de Capmany, has given, in his very valuable publication on the History and Commerce of Barcelona (*Memorias Historicas sobre la Marina, &c. de Barcelona*, tomo ii. p. 383.), an ordinance relative to insurance, issued by the magistrates of that city in 1435; whereas the earliest Italian law on the subject is nearly a century later, being dated in 1523. It is, however, exceedingly unlikely, had insurance been as early practised in Italy as in Catalonia, that the former should have been so much behind the latter in subjecting it to any fixed rules; and it is still more unlikely that the practice should have escaped, as is the case, all mention by any previous Italian writer. We, therefore, agree entirely in Capmany's opinion, that, until some authentic evidence to the contrary be produced, Barcelona should be regarded as the birthplace of this most useful and beautiful application of the doctrine of chances. — (Tom. i. p. 237.)

A knowledge of the principles and practice of insurance was early brought into England. According to Malynes — (*Lex Mercat.* p. 105.), it was first practised amongst

us by the Lombards, who were established in London from a very remote epoch. It is probable it was introduced some time about the beginning of the sixteenth century; for it is mentioned in the statute 43 Eliz. c. 12., in which its utility is very clearly set forth, that it had been an *immemorial usage* among merchants, both English and foreign, when they made any great adventure, to procure insurance to be made on the ships or goods adventured. From this it may reasonably be supposed that insurance had been in use in England for at least a century previous. It appears from the same statute, that it had originally been usual to refer all disputes that arose with respect to insurances to the decision of "grave and discreet" merchants appointed by the Lord Mayor. But abuses having grown out of this practice, the statute authorised the Lord Chancellor to appoint a commission for the trial of insurance cases; and in the reign of Charles II. the powers of the commissioners were enlarged. But this court soon after fell into disuse; and, what is singular, no trace can now be discovered of any of its proceedings. — (*Marshall on Insurance*, Prelim. Disc. p. 26.)

Few questions as to insurance seem to have come before the courts at Westminster till after the middle of last century. The decisions of Lord Mansfield may, indeed, be said to have fixed, and in a considerable degree formed, the law upon this subject. His judgments were not bottomed on narrow views, or on the municipal regulations of England; but on those great principles of public justice and convenience which had been sanctioned and approved by universal experience. His deep and extensive information was acquired by consulting the most intelligent merchants, and the works of distinguished foreign jurists; and by carefully studying the famous French ordinance of 1681, the most admirably digested body of maritime law of which any country has ever had to boast. Hence the comprehensiveness and excellence of his Lordship's decisions, and the respect they have justly commanded in all countries.* In his hands the law of insurance became, in a far greater degree than any other department of English law, a branch of that national or public law, of which Cicero has beautifully said, "*Non erit alia, lex Romæ, alia Athenis, alia nunc, alia posthac, sed et omnes gentes et omni tempore una lex et sempiterna, et immortalis continebit, unusque erit communis quasi magister et imperator omnium Deus.*" — (*Fragm.* lib. iii. *de Republicâ.*)

Insurance against fire and upon lives is of much later origin than insurance against the perils of the sea. The former, however, has been known and carried on amongst us, to some extent at least, for nearly a century and a half. The Amicable Society, for insurance upon lives, was established by charter of Queen Anne, in 1706; the Royal Exchange and London Assurance Companies began to make insurances upon lives in the reign of George I.; and the Equitable Society was established in 1762. But the advantages of life insurance, and the principles on which the business should be conducted, were then very ill understood; and the practice can hardly be said to have obtained any firm footing amongst us, till the Equitable Society, by adopting the judicious suggestions of Dr. Price, began its career of prosperity about 1775. Notwithstanding the example of England, life insurance has made comparatively little progress on the Continent. It was, indeed, expressly forbidden by the French ordinance of 1681 (liv. iii. tit. 6. art. 10.); by the regulations as to insurance issued at Amsterdam in 1612 (art. 24.); and it is doubtful whether the practice be not inconsistent with the 334th art. of the *Code de Commerce*, though it be now extensively carried on in France. But we are inclined to think that the want of security, more than any positive regulations, has been the principal cause of the little progress of life insurance on the Continent. Of whatever disadvantages our large public debt may be productive, it is not to be doubted that the facilities it has afforded for making investments, and the punctuality with which the national engagements have been fulfilled, have been the principal causes of the extraordinary extent to which the business of life and even fire insurance has been carried in this country.

II. Insurance (Marine).

There are few persons who are not acquainted, in some degree, with fire and life insurances. The security which they afford to individuals and families is a luxury which nobody, in tolerably comfortable circumstances, is willing to be without. Hence the great increase, in our days, of companies professing to afford this security; and hence the knowledge, on the part of the public generally, of the nature and principles of the engagements into which these companies enter. But marine insurance is a subject which is of immediate interest only to merchants and ship owners; unless, indeed, we should refer to that small portion of the community, who have occasion to transport themselves beyond seas with capital and effects for purposes of colonisation, or to fill some official situation. Hence the comparative indifference, on the part of the public, as to this subject. The general principles, however, of all insurance are the same; and in treating of marine insurance, it will be necessary to notice little beyond such topics as are peculiar to that branch of the business.

Individual Insurers or Underwriters. — The first circumstance that cannot fail to strike the general inquirer into the practice of marine insurance in this country, is that, while all fire and life insurances are made at the risk of companies, which include within themselves the desirable requisites of security, wealth, and numbers, a large proportion of marine insurances is made at the risk of individuals.

Prohibition of Companies. — Till 1824, all firms and companies, with the exception of the 2 chartered

* See Emerigon's famous *Traité des Assurances*, tome ii. p. 67.

companies, the Royal Exchange and London, were prohibited by law from taking marine insurances. Towards the latter end of that year, the prohibition was removed, and the business of marine insurance was placed on the same legal footing as other descriptions of business. While the restriction lasted, the 2 chartered companies did so little business, that marine insurance might, in fact, be said to be wholly in the hands of individuals. These companies were so much higher in their premiums, and so much more exclusive in the risks they were willing to undertake, than their individual competitors, that even those merchants and ship owners, who would cheerfully have paid some trifling consideration to obtain the greater security of a company, were obliged to resort to individuals. And it was only when the repeal of this absurd restriction was proposed, that the companies showed, by defending it, that they set any value upon their privilege. The underwriters at Lloyd's joined them in this opposition; and pamphlets were written and speeches made, to demonstrate how much merchants and ship owners would suffer, were the law to allow them the free use of their discretion in insuring their property; and how much more conducive to their interests it was, that they should be forced up to Lloyd's, to pay premiums to individuals rather than companies. But these pamphlets and speeches are forgotten; and we should be sorry to wound the feelings of their authors, or to trespass on the patience of our readers, by referring to them more particularly.

Formation of Companies.—There are at present 5 marine insurance companies in London; viz., the two old chartered companies, the *Royal Exchange* and *London*; two established immediately upon the passing of the act of the year 1824, the *Alliance* and the *Indemnity Mutual*; the *Marine*, established in 1836. These companies number among their proprietors or shareholders some of the most eminent merchants and ship owners of the city of London, who have united for the double purpose of providing a more perfect security for their property, and of ascertaining whether the insurance business might not be made to yield a fair return to the capital employed in it.

It may be computed that these 5 companies draw to themselves more than half the marine insurance business effected in London; and as several similar companies have also been formed since 1824 in different parts of the kingdom, it may be inferred, when due allowance is made for the difficulties to be combated in breaking through established modes and habits of doing business, that the tendency in the public is practically to confirm what antecedent investigation would suggest,—that companies, while they must necessarily hold out better security, and greater liberality and punctuality in the settlement of claims, are capable of transacting a given amount of business with a saving both of labour and expense.

Mode of conducting Business.—We shall now give an account of the existing arrangements for conducting the business of marine insurance, as well by individuals as the companies in London.

Lloyd's.—The individual underwriters meet in a subscription room at Lloyd's. The joint affairs of the subscribers to these rooms are managed by a committee chosen by the subscribers. Agents (who are commonly styled Lloyd's agents) are appointed in all the principal ports of the world, who forward, regularly, to Lloyd's, accounts of the departures from and arrivals at their ports, as well as of losses and other casualties; and, in general, all such information as may be supposed of importance towards guiding the judgments of the underwriters. These accounts are regularly filed, and are accessible to all the subscribers. The principal arrivals and losses are, besides, posted in 2 books, placed in 2 conspicuous parts of the room; and also in another book, which is placed in an adjoining room, for the use of the public at large.

The rooms are open from 10 o'clock in the morning till 5 o'clock in the afternoon, but the most considerable part of the business is transacted between 1 and 4. Those merchants and ship owners who manage their own insurance business, procure blank policies at the government office, or of their stationers, which they fill up so as to meet the particular object in view, and submit them to those underwriters with whom they are connected; by whom they are subscribed or rejected. Each policy is handed about in this way until the amount required is complete. The form of the policy and of a subscription is subjoined to this article.

The premium is not paid to the underwriter in ready money, but is passed to account. Nor does the underwriter debit the account of the person to whom he subscribes a policy with the whole amount of the premium, but with the premium less 5 per cent. Whenever losses occur which more than absorb the premiums on any one account, the underwriter is called upon to pay the balance. But should the underwriter's account be what is called good, that is, should the premiums exceed the claims, he sends round, during the spring and summer, to collect from his various debtors either the balance of his last year's account, or money on account, according to his judgment; but, upon what he receives, he makes an allowance of 12 per cent. An underwriter, if prudent, therefore, before he consents to receive, will not only look to the goodness of his account, but to the probability of its continuing so.

Insurance Brokers.—Many merchants and shipowners do not transact their own insurance business. They give their orders for insurance to others, who undertake it for them, and are responsible for its proper management. These latter persons are called insurance brokers; and some of them manage the business of a number of principals. To them, likewise, are transmitted the orders for insurance from the outports and manufacturing towns. They charge the whole premium to their principals, and their profit consists in 5 per cent. upon the premium, 12 per cent. upon the money that they pay to the underwriters, and ½ per cent. that they deduct from all the claims which they recover from the underwriters. It is proper to remark, that this is the established or regular profit; but competition has occasioned numerous deviations from it by the brokers, many of whom consent to divide this profit with the principals who employ them. The insurance brokers are not unfrequently underwriters also; and as some insurances are considered far more lucrative than others to underwriters, and as the brokers have particular facilities, in some respects, of judging of the goodness of their own risks, so likewise have they an inducement to play into one another's hands, and they do so accordingly.—(See BROKERS.)

It will at once be seen, that the trouble of effecting insurances at Lloyd's is considerable; that a good deal of time must be consumed; and that merchants and ship owners, therefore, have great inducement to consign their insurance business to brokers. But where the business is transacted with a company, this inducement, if not destroyed altogether, is, at all events, very much diminished. Any party having property to insure, has merely to go to the manager of the company, and state the particulars of the risk to be insured; the premium, being agreed upon, the manager writes out a memorandum for the policy, which the party signs, and he is thus effectually insured. The companies procure the stamp and write out the policy, which is ready for delivery in 4 or 5 days. The companies, like the underwriters, charge the premium less 5 per cent. In other respects they vary. They allow 12 per cent. upon the profitable balance of each year's premiums with credit till March or June; or 10 per cent. for prompt payment.

Payment of Losses.—Losses are paid at all the offices promptly, and without deduction. A month's credit is allowed to the underwriters: and another month, and sometimes 2 months, are given to the broker, to collect from the underwriters, and pay over to his principals.

Clubs.—Besides the individual underwriters and companies above noticed, there are clubs or associations formed by ship owners, who agree, each entering his ships for a certain amount, to divide among themselves one another's losses. These clubs are institutions of long standing; but, since the alteration of the law in 1824, appear to be on the decline. Their formation originated in a twofold reason: 1st, that the underwriters charged premiums more than commensurate with the risk; and, 2ndly, that they did not afford adequate protection. To avoid the first of these two evils, instead of paying a fixed premium, they pay among themselves the actual losses of their several members as they occur; and to avoid the second, they lay down certain principles of settlement in accordance with their views of indemnity. Each member of one of these clubs gives his power of attorney to the selected manager: and this manager

issues a policy for each ship, which policy is subscribed by him as attorney for all the members, the premium inserted in the policy being understood to be nominal. These clubs are open to the leading objections that apply to individual underwriters; for the members are not collectively, but only individually, liable to those of their number who happen to sustain a loss; and the delay of settlement is such, that more than 12 months have been known to elapse before the payment of a loss has been obtained from all the members.

Rate of Premium. — But little need be said upon the circumstances that influence the rate of premium demanded by the insurers. It must be self-evident that premiums will vary according to the seasons, the quality of the vessel, the known character of the captain, the nature of the commodity, and the state of our political relations. All these, of course, are matters upon which each individual must exercise his own discretion, partly from general experience, and partly from particular information; exaggeration of risk, and consequent exorbitancy of premium for any length of time, being out of the question, where so many individual underwriters, in addition to the companies, are in competition with one another, and where the merchants have the means at hand of effecting their insurances abroad. We have already taken notice of the intelligence of which Lloyd's is the focus. In addition to this, there is a subscription register book for shipping maintained by the principal merchants, ship owners, and underwriters. This book professes to give an account of the tonnage, build, age, repairs, and quality of almost all the vessels that frequent our ports; and, although exceedingly defective in many respects, is a material assistance to the insurers, who have no means of ascertaining by their own observation the particulars of 1 in 100 of the ships they are called upon to insure.

Contract of Insurance.

Having thus given a general outline of the mode of transacting business between the insurers and insured, and the means used to enable both parties to come, as near as possible, to a due estimate of the risk to be insured against, our next step will be to explain the nature of the contract, and the bearing of its more important clauses.

It is unnecessary to state that the object of those who are engaged in commerce, or in moving articles of merchandise from one part of the world to another, is to *buy* at such a price that, after paying all the expenses of transport, the *sale* price may leave them a surplus in the shape of profit. If there were no such contrivance as insurance, merchants would be obliged to calculate upon the probability of the occasional loss of their property, and to regulate their transactions accordingly; but it must be obvious that enterprise, under such circumstances, would be very much crippled. Now, insurance, in as far as it approaches perfection in guaranteeing the merchant against all loss, except that of the market, substitutes a fixed charge for uncertain and contingent loss, and enables him to confine his attention exclusively to price and quality, and to charges of transport; in which latter, of course, the premium of insurance is included. As, however, in practice, insurance is by no means a perfect protection, either to the merchant or ship owner, against all loss that may occur *in transitu*, there is, even after insurance, some contingencies remaining to be taken into consideration: and we do not know that we can do better, by way of explaining the contract of insurance, than state, as briefly and succinctly as possible, what are the losses against which the merchant and ship owner are not protected by an insurance effected in this country.

1. *Acts of our own Government.* — All losses arising from the acts of our own government. Thus, if an embargo were laid on vessels about to sail for a particular quarter, and the merchant obliged to unload his goods; or if his goods were condemned to be destroyed in quarantine; or purposely destroyed at sea by some of our cruisers; no part of his loss would be made good by the insurer. The insurer in this country, although liable for the acts of foreign powers, is not liable for such acts directed against the property of their own subjects. Thus, if French property, insured in this country, were confiscated by the French government, the owner would have no remedy against his insurer.

2. *Breaches of the Revenue Laws.* — All losses arising from a breach of the revenue laws. It may be observed, that if the owner of the ship, by his act, expose the goods of the merchant to loss, the merchant so injured, although he cannot recover from his insurers, may claim from him. It may also be observed, that if the captain of the vessel, by his act, to which neither the owner of the ship nor the merchant is a party, expose the ship and cargo to loss, the insurers, in such case, are bound to make good the loss; the insurers being liable for all damage arising from illegal acts of the captain and crew, supposing the owner of the ship not to be accessory. The illegal acts of the captain and crew, contrary to the instructions and without the consent of the owners, are termed "barratry" in the policy. — (See Barratry.)

3. *Breaches of the Law of Nations.* — All losses arising from a breach of the law of nations. Thus, if any port is declared by a foreign power to be in a state of blockade, and such blockade is acknowledged by our government; and if a ship, in defiance of that notification, attempt to break the blockade, and is taken in the attempt; the insurer is not liable to the loss. It will often happen, when a port is under blockade, that the profit is so great upon goods introduced in defiance of the blockade, as to tempt adventurers to break it, and to enable them to afford a very high premium to insure against the risk. But as policies for such an object are not acknowledged in our courts of law, when effected, they are understood to be *policies of honour*. The same kind of policy is adopted by the underwriters, to protect foreign merchants who prefer insuring in this country against British capture.

4. *Consequences of Deviation.* — All losses subsequent to any deviation from the terms of the policy. Thus, if a merchant, in a policy on produce from the West Indies to London, warrant the ship to sail on or before the 1st of August, and the ship sail after that day and be lost, the insurer is exonerated. Or, if a merchant insure from London to Lisbon, and the ship call at Havre and is afterwards lost, the insurer is not liable. It will be understood, of course, that the owner of the ship is liable to the merchant for any breach of contract on his part, as well as that the insurer is liable for the barratry of the master; a deviation on the part of the master, not intended for the benefit of the owner, and contrary to his instructions, being considered barratry. Should the owner of the goods neglect to describe accurately the voyage for which he wishes to be insured, the loss would be a consequence of his own negligence.

There is a doctrine connected with barratry which it will here be proper to notice. A captain, owner or part owner of the ship in which he sails, cannot commit an act of barratry. In other words, the insurers are not, in such a case, liable for an act of his which would otherwise be barratrous. The equity of this doctrine, as far as regards the interests of the captain himself, cannot be called in question; but it is difficult to understand why the merchant who ships goods on board such a captain's vessel should not be permitted to insure, among other risks, against the captain's illegal acts. We have heard that a clause has occasionally been introduced into policies to protect merchants against captain-owners, and we do not suppose that our courts of law would refuse to enforce such a clause. Indeed, we cannot discover any reason why every party, saving the captain, should not have the power of insuring against the consequences of illegal acts of the captain. We believe, that among the life offices which protect themselves from loss by suicide and the hands of justice, there are some which make a distinction in favour of those who merely hold policies on the lives of others as a collateral security. The propriety of such a distinction must strike every body.

5. *Unseaworthiness.* — All losses arising from unseaworthiness. Unseaworthiness may be caused in various ways, such as want of repair, want of stores, want of provisions, want of nautical instruments, insufficiency of hands to navigate the vessel, or incompetency of the master. It might be supposed, at first sight, that insurance affords a much less perfect security than it really does, seeing on how many pleas it is possible for the insurer to dispute his liability; but when it is considered that the proof of unseaworthiness is thrown upon the defendant, and that the leaning of the courts is almost always in favour of the insured, it will be easy to suppose that no respectable insurers would ever plead unseaworthiness,

unless they could make out a case of more than ordinary strength and clearness. The degree of uneasiness felt by merchants and ship owners at their liability to be involved in loss by cases of unseaworthiness, may be guessed from the fact that although the Indemnity Assurance Company at one time precluded themselves from pleading unseaworthiness by a special clause in their policy, not only did they obtain no additional premium in consequence thereof, but they did not even obtain a preference over other companies and individuals at the same premium. At least, this fact must either be admitted as a proof of the absence of uneasiness on this head, or of that inveteracy of habit which seems to lead the great bulk of mankind always, if possible, to continue undeviatingly in those courses to which they are accustomed, even where the benefits to be derived from a deviation are undeniable.

6. *Protraction of the Voyage.* — All loss arising from unusual protraction of the voyage. Thus, if a ship meet with an accident in the Baltic, and the repairs detain the vessel till the close of the season, when the passage home is rendered impracticable by the ice till the opening of the ensuing season, no payment is made to the merchant, in mitigation of his loss from interest of money, loss of market (if the market fall), or deterioration in the quality of his goods (unless arising from actual sea damage); nor to the ship owner, in mitigation of his loss from the extra wages and maintenance of his crew. In most foreign countries the ship owner is remunerated by the insurers for the wages and maintenance of his crew while his ship is detained in consequence of any loss for the making good of which they are liable.

7. *Liability for doing Damage to other Vessels.*—All loss to which the ship owner is liable when his vessel does damage to others. According to our laws, the owner of every ship not in charge of a pilot, that does damage, by negligence of the master and crew, to any description of craft or vessel, is liable to make good the same to the extent of the value of his own ship and freight: for beyond this he is not liable. The common policy in use among the underwriters at Lloyd's and the companies does not protect the ship owner from this loss. But the clubs or associations before mentioned almost universally take this risk. Indeed, this is one of the purposes which gave rise to their formation. But even they limit their liability to the amount of the policy; so that if a ship insured with them were to run down another, and to sink herself in the collision, the owner would only receive the value of his own vessel from the club, and still be liable to the owner of the other vessel. A custom has gained ground of late years, both among the underwriters at Lloyds, and the Insurance Companies, to admit their liability by a clause in their policies for 3-4ths of the loss which the owner of the vessel insured with them may sustain from damage done by his vessel to those of others. If such a case as the one just supposed should occur, the insured would receive by virtue of this clause, the value of his own vessel and 3-4ths of the loss to be made good by him to the owner of the other vessel.

8. *Average Clause.* — The next description of loss of which we shall treat, against which the insured are not protected, is described in the following clause of the policy: — "Corn, fish, salt, seed, flour, and fruit, are warranted free from average, unless general, or the ship be stranded; sugar, tobacco, hemp, flax, hides, and skins are warranted free from average under 5 per cent., unless general, or the ship be stranded; and all other goods, also the ship and freight, are warranted free from average under 3 per cent., unless general, or the ship be stranded."

The language employed in this clause, being technical, requires explanation, to render it intelligible to the general reader. Average is a name applied to certain descriptions of loss, to which the merchant and ship owner are liable. There are two kinds of average, general and particular.

General Average comprehends all loss arising out of a voluntary sacrifice of a part of either vessel or cargo, made by the captain for the benefit of the whole. Thus, if a captain throw part of his cargo overboard, cut from an anchor and cable, or cut away his masts; the loss so sustained, being voluntarily submitted to for the benefit of the whole, is distributed over the value of the whole ship and cargo, and is called "general average."

Particular Average comprehends all loss occasioned to ship, freight, and cargo, which is not of so serious a nature as to debar them from reaching their port of destination, and when the damage to the ship is not so extensive as to render her unworthy of repair. Losses where the goods are saved, but in such a state as to be unfit to forward to their port of destination, and where the ship is rendered unfit to repair, are called "partial or salvage loss." The leading distinction, between particular average and salvage loss is, that, in the first, the property insured remains the property of the assured — the damage sustained, or part thereof, as the case may be, and as will be hereafter explained, being made good by the insurer; and in the second, the property insured is abandoned to the insurer, and the value insured claimed from him, he retaining the property so abandoned, or its value.

Particular Average on Goods. — A few cases illustrative of the method of stating a claim for particular average will best explain the nature of this description of loss, and will at the same time show the reader what the practical distinction is between particular average and salvage loss.

The property insured we shall suppose to be *a ton of hemp*, the cost of which at Petersburg is 30*l.*, for which sum it is insured from Petersburg to London, and that the duty, freight, and charges to which the merchant is subject on landing at London are 10*l.* We shall likewise suppose that the hemp, on its arrival, is so damaged as not to be worth more than half what it would have fetched had it been sound. The insurer would then be called upon to make good to the insured 15*l.*, or 50 per cent. upon the sum insured. But it does not follow that this payment of 15*l.* would indemnify the merchant, or that it would not more than indemnify him, for the loss sustained.

	£ s.	£ s.
If the hemp upon arrival in this country would have fetched in a sound state	50 0	
Less duty, freight, and charges	10 0	
		40 0
But in its damaged state is only worth	25 0	
Less duty, freight, and charges	10 0	
		15 0
The merchant's loss by the damage is		£25 0

Whereas he only receives from the insurer 15*l.* Upon the principle of a salvage loss he would also receive 15*l.*

	£ s.	£ s.
If the hemp would have fetched in a sound state	20 0	
Less duty, freight, and charges	10 0	
		10 0
But in its damaged state is only worth	10 0	
Less duty, freight, and charges	10 0	
The merchant's loss by the damage is		£10 0

Whereas he receives from the insurer 15*l.* Upon the ciple of a salvage loss he would receive 50*l.*

	£ s.	£
If the hemp would have fetched in a sound state	30 0	
Less duty, freight, and charges	10 0	
But in its damaged state is only worth	0 0	
Less duty, freight, and charges	10 0	
		5 0
The merchant's loss by the damage is		£15 0

And he receives from the insurer 15*l.* Upon the princip of a salvage loss he would receive 25*l.*

It will be observed that the merchant's loss by the damage of his goods varies with the state of the market. It may also be observed, that in general the merchant will not receive from the insurer the whole amount of the loss that he sustains. Whenever his market is a profitable one (and that it must usually be so will be obvious to every body), whenever, indeed, his market is not a decidedly losing one, his policy does not afford him a complete protection.

The argument in favour of this mode of settling claims for particular average — and it should be observed that the subject has been discussed, and the principle acknowledged in the courts of law —

is, that the insurer's liability is to be guided by the amount upon which he has received a premium or consideration; that he is not to be affected by the rise or fall of markets; but that the *gross* market price of the *sound*, and the *gross* market price of the *damaged* goods, are to be the test by which the rate of damage upon the amount insured is to be adjusted; the insurer being liable, besides, for all the extra charges arising out of the damage.

In the first case stated, the merchant's loss by damage is 25*l.* upon 40*l.*, or 62½ per cent.; in the second, 10*l.* upon 10*l.* or 100 per cent.; in the third, 15*l.* upon 20*l.* or 75 per cent. If the duty, freight, and charges were diminished in proportion to the diminished value of the goods, the loss in each case would be 50 per cent. upon the nett price, as it is 50 per cent. upon the gross price. As far as the duty is concerned, government, upon some articles, reduces it in proportion to the diminution in the value of the goods; and if the freight were reduced in a similar manner, the merchant would always be indemnified for his loss by the insurer. But the practice with regard to freight in this country admits of no such arrangement; freight being paid according to the quantity delivered.

To make the principle upon which claims for particular average are adjusted, and its bearing, still clearer, we shall illustrate it by a few more cases. Suppose two packages to be insured at cost price — a cask of rice and a cask of sugar — each weighing 10 cwt.; the cost of each at the port of shipment 10*l.*, the freight of each 10*s.* per cwt. at the port of delivery, both articles free from duty, and to arrive at a market where no more than the cost price is realised; assuming that both packages are damaged 50 per cent. — the rice by loss of quality, the sugar by loss of weight — the statement will be as follows: —

	£ s.	£ s.
10 cwt. of rice, had it arrived sound, would have produced	15 0	
Less freight on 10 cwt. at 10*s.* per cwt.	5 0	
		10 0
But being damaged, did only produce	7 10	
Less freight on 10 cwt. at 10*s.* per cwt.	5 0	
		2 10
Merchant's loss		£7 10

	£ s.	£ s.
10 cwt. of sugar, if sound, would have produced	15 0	
Less freight on 10 cwt. at 10*s.* per cwt.	5 0	
		10 0
The barrel, being damaged, did only weigh 5 cwt., and produce	7 10	
Less freight on 5 cwt. at 10*s.* per cwt.	2 10	
		5 0
Merchant's loss		£5 0

In each case the merchant is entitled to recover from his insurer 5*l.*, or 50 per cent., upon 10*l.*, the sum insured, which, although an indemnity to him for his loss on the sugar, is far from being so for his loss upon the rice. If the merchant would contrive so to shape his contract with the ship owner for freight, as to reduce the freight in proportion to the depreciation in the value of the damaged commodity, he would be completely protected. The ship owner might on his side protect himself by insurance from loss by reduction of quality, as he now does from loss by reduction of quantity. But we have already more than once adverted to the difficulty of breaking in upon established practices. The merchants go on from year to year complaining of the losses to which they are subjected from this awkward contrivance, while no steps are taken to improve it. To show that the principle is equitable as between the merchant and his insurer, we subjoin one more statement, where the damage is taken at 100 per cent.

	£ s.	£ s.
10 cwt. of rice, if sound, would have produced	15 0	
Less freight on 10 cwt. at 10*s.* per cwt.	5 0	
		10 0
Being totally spoiled, did produce nothing. The merchant being still liable for the freight		5 0
Making his loss		£15 0

He receives 10*l.* only from the insurer.

	£ s.	£ s.
10 cwt. of sugar, if sound, would have produced	15 0	
Less freight on 10 cwt. at 10*s.* per cwt.	5 0	
		10 0
The barrel being washed out produces nothing. The merchant, however, not being liable to pay freight		
His loss is only		£10 0

Which he recovers from the insurer.

It will be observed, that in each case the insurer pays 10*l.*, or the full sum upon which he receives the premium.

When whole cargoes, or parcels of goods of considerable value, are insured, the clause in the policy which protects the insurer from particular average under a certain percentage is often partially set aside. Thus, if a cargo of 500 hogsheads of sugar, valued at 10,000*l.* were damaged to the extent of 460*l.*, the merchant, supposing the protecting clause to remain in force, would recover nothing from the insurer, the loss not amounting to 5 per cent. The additional written clause, by which it is the practice to modify the printed clause, is as follows: — "Particular average, payable upon each 10 hhds. sugar, 10 casks and 50 bags coffee, and 10 bags cotton, following numbers, and upon each package of manufactured goods, chest of indigo, bag of wool or silk, the same as if separately insured." Such clauses may be, and are, introduced *ad libitum* by mutual consent of insurer and insured, the premium or consideration being arranged accordingly.

The protecting clause is considered, on the other hand, by the insurers, exceedingly unsatisfactory in some respects; and they, as occasion requires, insist upon additional protection. Thus, saltpetre, hides, cocoa, and tin plates, are generally warranted free from particular average, unless the ship be stranded; and upon tobacco, it is customary for the insurers to make themselves liable only to such part of the particular average as exceeds 5 per cent., throwing 5 per cent. upon the merchant.

Particular Average on Freight. — The clause, as far as it affects "freight," calls for no particular comment. Particular average upon freight can only arise, according to prevailing practice, from loss of weight; and whenever the loss of weight amounts to 3 per cent. or upwards, the ship owner is entitled to recover from his insurer. The ship owner, upon the arrival of the ship at its port of destination, is entitled to hold the goods as security until the freight is paid. If the owner of the goods should prove insolvent, and the goods should be entirely spoiled by sea damage during the voyage, and the ship owner thus lose his freight, he has no claim upon the insurer; because, although his collateral security is destroyed by a peril of the sea, his right to receive freight remains unimpaired, and it is against the loss or impairing of this right that the insurer protects him.

Particular Average on Ships. — Particular average upon ships is a subject somewhat more beset with difficulties. There is scarcely a ship that makes a voyage of any length, that does not sustain some damage. The clause in the policy warranting the ship free from particular average under 3 per cent., unless stranded, protects the insurer from the constant recurrence of petty claims; but in addition to this, it is the practice to class the damage that a ship sustains in the prosecution of her voyage under two heads: ordinary damage, or wear and tear; and extraordinary damage, or particular average. The splitting of sails, the breaking of anchors and cables, the upsetting of windlasses, are losses that come under the first head. The carrying away of masts and bulwarks, damage to the copper sheathing and hull from striking on rocks, come under the second.

When a ship sustains damage, if she be on her first voyage, the whole expense of the repairs is made good by the insurers. But if she be not on her first voyage, it is the established custom that the insurer pays no more than 2-3ds of the repairs, the owner of the vessel having, as it is thought, an equivalent for the 1-3d which falls upon him, in the substitution of new work for old. Where the nature of the damage is such as to require that the copper should be stripped off the ship's bottom, the insurer pays the difference between the price of the old and the new copper on the weight of the old copper stripped off; the excess in weight of the new over the old copper is paid for by the ship owner; and the labour of stripping and replacing the copper is paid for on the principle already mentioned. In any general

rule of this kind, it must be obvious that the ship owner will sometimes gain and sometimes lose by an accident. As soon as the ship owner, or his captain, learns that his vessel has met with an accident, or as soon after as possible, he summons regular surveyors to examine his vessel and report all defects, discriminating between those defects that have arisen from perils of the sea, and those from wear and tear. The first only are made good by the insurer, together with all charges, such as surveyors' fees, dock dues, &c., caused by the necessity of undergoing repair. It has been already observed, that when a ship is obliged, in the progress of her voyage, to put into port for the purpose of repair, although the owner of the ship be subjected to great expense for the wages and maintenance of his crew during the detention, he can recover no part of this expense from the insurer; the doctrine being, that the owner of the ship is bound to navigate his vessel, and that the insurer does not undertake to guarantee that the voyage shall be completed within any specific time. Such is the doctrine, at least, in this country, and the practice is founded upon it; but in all other countries the doctrine and practice are the reverse. For in them allowance is made to the ship owner for the wages and maintenance of the crew during the whole period that the ship is under repair. Where a vessel sustains damage and undergoes repair in the progress of her voyage, and is subsequently lost, the insurer is liable both for the particular average and a total loss. Or the owner of the ship may, if he please, insure the amount expended in repair; and then, in the event of subsequent loss, the insurer is liable for the total loss only; but in the event of subsequent safe arrival, the average is augmented by the charge of insurance.

The operation of the clause warranting the ship free from average under 3 per cent., unless general, or the ship be stranded, may now be clearly seen. If a ship be insured and valued at 10,000*l.*, and the repairs of the vessel do not, after all the deductions above referred to, amount to 3 per cent., there is no claim upon the insurer, unless the vessel shall have been stranded.—(See AVERAGE.)

Stranding.—The term stranded is not well chosen, admitting of more than one construction; and the clause of which it forms a part is imperfectly conceived. And in settlements of accounts, when differences arise, the parties who discuss them are more apt to strive for that interpretation of terms and clauses which is favourable to their interests, than for that which is best adapted for general purposes. It is commonly understood that merely striking the ground and coming off is not a stranding; it being necessary, in order to fall within that term, that the ship should remain on the ground or rock, as it may happen, and that efforts should be made to float her. Striking on an anchor and leaking dangerously is not a stranding. We shall only adduce two illustrations, for the purpose of showing how ill adapted this clause is as a means to an end. Corn and other such articles are warranted free from particular average, unless the ship be stranded, because the insurers, considering these articles to be peculiarly susceptible of damage, will not consent to take that risk, except on some extraordinary occasion. A ship, laden with corn, makes a very stormy passage from the Baltic to London, and damages the whole of her cargo. Upon arrival off our coast she is stranded, but got off without straining or sustaining any damage. The insurer is held to be liable for the damage to the corn, under the clause of the policy. On another occasion, after a very favourable passage to our coast, a ship strikes upon a shoal, but is not stranded, sustaining, however, so much damage that she arrives at London with 6 feet water in her hold, and her cargo almost wholly spoiled. The insurer is held not to be liable under the clause of the policy.

General Average.—The insurer is bound to make good all general average without exception, however trifling the account. General average is treated as though altogether unconnected with particular average; and damage to the goods not amounting to 3 per cent. is not payable by the insurer, although there may be also a general average, and the general and particular average together may amount to more than 3 or 5 per cent. General average is a charge which must be paid by the merchant and ship owner, even if uninsured; although, when insured, he transfers, as it were, in virtue of his insurance, the charge from himself to his insurer. All the elements that can by possibility enter into general average may be classed under four heads:—1. Sacrifice of part of the ship and stores; 2. Sacrifice of part of the cargo and freight; 3. Remuneration of services required for general preservation; 4. Expense of raising money to replace what has been sacrificed, and to remunerate services.

1. When any part of the ship is sacrificed for the general benefit, the owner is entitled to receive (deducting, of course, his share of contribution) the amount of his outlay in the replacing of such sacrifice; allowance being made, on the principle stated above, where old works and materials are replaced with new. The deduction of 1-3d, however, does not invariably apply. For instance, 1-6th only is taken off the price of an iron cable that is slipped from for the general benefit, because iron cables are calculated to last for a great number of years; and no reduction is ever made from the price of anchors. The charge of replacing the loss may amount to considerably more than the value lost, computing the value at the place where the ship was originally fitted. Thus, the cost of replacing an anchor and cable slipped from in the Downs, is frequently double the value of the anchor and cable at London. But whatever the charge may be, such charge forms the basis of settlement.

2. Sacrifice of the cargo and freight takes place in jettison, or where part of the cargo is flung overboard to lighten the vessel. Upon arrival in port, after such jettison, the owner of the goods jettisoned is entitled to receive (deducting his share of contribution) what the goods would have produced nett to him, supposing them to have arrived sound; and the owner of the ship is entitled to receive (deducting his share of contribution) the freight to which he would have been entitled upon the safe delivery of the goods.

3. Remuneration of services and other charges. When a ship loses her anchors and cables, very large sums are frequently awarded to boatmen who venture off to her with new ones at the imminent hazard of their lives. A ship disabled at sea is towed into port by another, and remuneration for such service is awarded according to the value saved, the detention occasioned, and the loss sustained. The ship rendering the service may be laden with fish or fruit, that may be totally spoiled by the detention, or may be in ballast. A ship captured by the enemy may be re-captured by a man of war or armed merchant vessel; here, again, salvage is awarded according to the circumstances of the case. All these charges are general average; that is to say, must be distributed over ship, freight, and cargo. When a ship, with her cargo, is driven on shore, the expense of attempting to get her off is general average. If she cannot be got off without discharging, the expense of discharging is general average; but the expense of getting the ship off after the cargo has been taken out falls exclusively upon the ship. The warehousing of the cargo, and other expenses incurred for its preservation, are charges exclusively upon the cargo. The expense of reloading is borne by the freight. When a ship puts into port in distress, the pilotage inwards is general average; the pilotage outwards is a charge upon the freight. This distribution of charges has settled into a tolerably well established practice; and upon this principle claims are settled at the offices, and at Lloyd's.

4. The money required to meet the above charges is sometimes attainable without expense. If the accident happen near home, and the ship owner be respectable, he advances the money and recovers from the various parties concerned so soon as the accounts can be made up: or if the accident happen in a foreign port, where the owner of the ship is well known, the captain's bill upon him will sometimes be received in payment of the charges incurred. But where such facilities do not exist, the captain is empowered to pledge his ship, freight, and cargo, as security to any one he may prevail upon to supply the necessary funds. This pledge is termed a bottomry bond. By it the captain admits the receipt of the money; consents to the payment of a premium (which varies with the distance of the port of destination, the risk of the voyage, the respectability of the owner and the necessities of the captain); and assigns the ship, freight, and cargo, as security for the repayment of the money advanced and the stipulated premium. Should the captain consider the bottomry premium demanded of him exorbitant, or should he deem it preferable in other respects, he may sell a portion of the cargo for the purpose of raising such

money as he may stand in need of towards the prosecution of his voyage. The expense of raising the requisite funds, whether by commission, by bottomry premium, or by loss on the sale of the cargo, is charged to those parties for whose interest the money is required. Thus, if a ship, having struck upon a rock, puts into port in distress, and is obliged to unload to repair; supposing the particular average upon the ship to amount to 500*l.*; the general average, consisting of assistance into port and expense of unloading, 200*l.*; particular charges on freight, consisting of expense of reloading and pilotage outwards, 100*l.*; and particular charges on cargo, consisting of warehouse rent and repair of packages, 200*l.*; and the expense of raising money should be 20 per cent.; — these sums would be severally increased by this addition, and would be raised to 600*l.*, 240*l.*, 120*l.*, and 240*l.* — (See BOTTOMRY.)

It still remains to be inquired in what proportion the general average is to be paid by the different owners of the cargo, and the owner of ship and freight. Almost all general averages are adjusted at the ship's port of destination, and the values of the ship and cargo are taken at what they would produce in their actual state upon arrival, and the freight according to what is actually receivable, less the wages of the captain and crew; the general average being distributed in proportion to these values. Should the cargo be altogether worthless, it cannot be made to contribute; and should the wages of the crew exceed the freight, then the freight is not liable to contribute. In case of jettison, the party whose property has been sacrificed for the general benefit receives indemnity on the same principle; the value to which he is entitled being what his property would have produced *nett*, supposing it to have been sold on the arrival of the vessel — the same value serving for the basis of his proportion of contribution. Some few cases occur where the general average is adjusted at the port of departure. Thus, if a ship, outward bound to the British colonies, cut from an anchor and cable in the Downs, or incur other general average on our own coast, the insurances being principally effected in this country, it is the custom to adjust it on the spot, by which means both delay and expense are avoided. On these occasions, the values at the port of shipment are taken as the basis of contribution. A total loss, subsequently to a general average, does not exonerate the insurer from his prior liability; and although it is customary with the ship owner, or his agent, specifically to insure the money expended in average, for the purpose of protecting the insurer against any greater liability than 100 per cent., he is not absolutely obliged to do so. When the average funds are raised by bottomry, the party advancing them takes the ship, freight, and cargo, as security, and charges a premium to cover the risk of the ship's non-arrival at her port of destination. And thus, on such an occasion, a subsequent total loss relieves the insurer from all liability to average.

The laws and customs by which averages are adjusted vary in different countries; but the insurer in this country is only liable for the averages adjusted according to our laws. The merchant, however, whose goods arrive at a foreign port, is obliged to submit to the laws of that port. He may thus be a considerable loser; paying general average according to one law, and receiving from his insurer according to another. And he never can be a gainer, because, before he is entitled to recover from his insurer, he must prove that he has paid to the owner of the ship. This is one of the many inconveniences to which mercantile men are exposed, which cannot be entirely removed without, what it may be hoped will gradually take place, an assimilation of the commercial laws of different countries. A partial remedy for this grievance has been found in the introduction of a clause, into policies when the ship is bound to a foreign port, to this effect: general average to be paid according to the foreign statement.

Proof of Loss.—The policy of insurance is the instrument upon which the merchant and ship owner claim indemnification for all losses that are not specially excepted." The proof that the loss has been sustained must also be exhibited; such as the title to the vessel and cargo, and the evidence of the captain and crew to establish the circumstances out of which the claim arises. If A. were to insure his vessel for the space of 12 months, and at the expiration of 6 months were to sell his ship to B.; A.'s interest in the vessel having ceased, so also does his insurer's liability, unless the policy be sold with the ship; and B., if he wish to be protected, must make a new insurance, or purchase A.'s policy. Proof of ownership, therefore, is an essential preliminary to the recovery of a claim. In general practice, no difficulty arises from this, because the fact of ownership is sufficiently notorious. The bill of ading is, in most cases, satisfactory proof that the cargo was on board, as well as of the amount of freight.

Valued and open Policies. — If an insurance for 2,000*l.* be effected upon 100 hhds. of sugar, valued at 20*l.* per hhd., the bill of lading, showing that the vessel had 100 hhds. on board, establishes the interest at 2,000*l.*, and the policy is termed a valued policy. But if an insurance for 2,000*l.* be effected on 100 hhds. of sugar, and nothing be expressed as to value, the bill of lading only establishes that 100 hhds. are on board, without establishing the amount of interest. The production of the invoice, showing the cost of the goods, is necessary to that end, the policy being termed an open one.

Return of Premium for short Interest. — In a valued policy, when the whole of the property insured does not appear to have been shipped, the difference between the quantity insured and the quantity shipped is termed short interest. Thus, if 2,000*l.* be insured upon 100 hhds. of sugar, valued at 20*l.* per hhd., and 80 hhds. only be shipped; as the insurer's liability does not extend beyond 1,600*l.*, so he is obliged to return the premium upon 400*l.* to which no risk attaches. This return of premium is called a return for short interest.

For Over-Insurance. — In an open policy, where the value shipped is not equal to the value insured, the difference is termed over-insurance. If a merchant, A., make an insurance for 5,000*l.* upon goods, without specifying any value, from Calcutta to London, the premium being 60*s.* and the stamp duty 4*s.* per cent., the amount of interest that attaches to the policy is so fixed, that he is neither to gain nor lose by the transaction in the event of the vessel's loss, supposing his insurance to be sufficient. To entitle him to recover a profit, the profit to be insured must be stipulated in the policy. The expense of insurance upon 100*l.* being 3*l.* 4*s.*, it is clear that every 100*l.* insurance covers 96*l.* 16*s.* original cost; that is to say, protects the merchant from loss to that extent in case of the loss of the vessel. If, then, we assume the invoice of the goods shipped to be 40,000 rupees, or, at the exchange of 2*s.* per rupee, 4,000*l.*, the interest attaching to the policy is ascertained as follows: If 96*l.* 16*s.* cost is insured by 100*l.* insurance, what will the 4,000*l.* cost be insured by? Answer, 4,132*l.* Under such circumstances, although a policy exists for 5000*l.*, the insured is not able to prove interest for more than 4,132*l.*; and consequently, the insured being entitled to recover no more than that sum in case of loss, the insurer is called upon to make a return of premium for over-insurance upon 868*l.*

Although we have treated separately of returns for short interest and over-insurance, we should observe that these terms in practice are used indiscriminately; and, indeed, we cannot say that we perceive much advantage in making the distinction, or preserving the distinctive appellations.

It sometimes happens that the property expected in a vessel is not all insured at one time or in one policy. But this makes no difference in the principle of settlement according to our law: although, according to the laws of most other countries, the policies take precedence of one another according to their dates, the whole short interest falling upon the policy or policies last effected. The foreign law, in this instance, appears to us the more equitable and reasonable of the two; and that our reason for thinking so may be intelligible, and thus gain assent or meet with refutation, we shall state a case of short interest upon a number of policies, such as not unfrequently appears. A merchant, A., orders his correspondent at Calcutta to ship for his account a quantity of sugar, not exceeding 1,000 tons, at a price not exceeding 20*l.* per ton. In due time he receives a letter from his correspondent acknowledging the receipt of his order, and expressing confident hopes of being able to purchase the quantity, or the greater part of it, at the limits prescribed, and promising to advise as he proceeds. A., on receipt of this letter, say on the 1st of January, makes a provisional insurance for 5,000*l.* upon sugar valued at 20*l.* per ton. Continuing without further advices, and fearing lest his correspondent's letter should have miscarried, and that he might have property afloat uninsured, on the 1st of February, 1st of March, and 1st of April, he effects similar

insurances, thus covering the whole 1,000 tons. He subsequently receives advice that his correspondent had not been able to purchase more than half the quantity ordered, at his limit, and he recovers from his insurers half the premium upon each policy. Now, it was not at all improbable that he might have received advice from his correspondent, as he expected, much sooner. And if he had received advice in the middle of February, of the shipment of 500 tons, and that the ship which contained them was totally lost in the river Hooghly, the insurers upon the two first policies would have been liable for a total loss. And it appears to us a defective arrangement, by which a party, who is at one time exposed to a total loss, should at another be compelled to return half his premium. It is true that the merchant may, if he please, insert in his policies a clause by which the policies shall be made to succeed one another; but we should say that the law, in insurance cases, as in the disposal of the property of deceased persons, ought to be the best general disposition, leaving to individuals the right of modification according to particular circumstances.

Return for Double Insurance.—Besides returns for short interest and over-insurance, there are returns for double insurance. They are, in fact, to all intents and purposes, the same thing. Double insurance exists where the party, through forgetfulness, makes an insurance upon his property twice over; or where the shippers and consignees of goods, when uncertain of one another's intentions, effect each an insurance upon them; or where the captain of a vessel in foreign parts, fearing lest his advices should not reach his owner, effects an insurance upon it, and the owner at the same time, acting with equal caution, effects one also. The observations already made upon returns for short interest, and upon the difference between our laws and those of other countries, apply with equal force here.

We have now gone over all the principal topics connected with marine assurance. Those who peruse this article with ordinary attention will, we hope, gain a tolerably clear insight into the principles and practice of the business. But a perfectly familiar acquaintance with it can only be acquired by those who are daily conversant with its details.

Duty on Policies of Marine Insurance.—This is regulated by the act of 1844, 7 Vict. c. 21.

	£	s.	d.
For every policy of assurance or insurance, or other instrument, whereby any insurance shall be made upon any vessel, or upon goods, or other property on board any vessel, or upon the freight of any vessel, or upon any other interest relating to any vessel which may lawfully be insured for any voyage whatever, the following duties, where the whole sum insured shall not exceed 100*l.*, and where the whole sum insured shall exceed 100*l.*, then for every 100*l.*, and also for any fractional part of 100*l.*, whereof the same shall consist; viz.—			
Where the premium or consideration for such insurance shall not exceed the rate of 10*s.* per cent on the sum insured - - - -	0	0	3
And where the same shall exceed 10*s.* per cent, and not exceed 20*s.* - - - -	0	0	6
20*s.* and not exceeding 30*s.* - -	0	1	0
30*s.* and not exceeding 40*s.* - -	0	2	0
40*s.* and not exceeding 50*s.* - -	0	3	0
50*s.* - - - -	0	4	0
But if the separate interests of 2 or more persons be insured by one policy or instrument, then the said respective duties, as the case may require, shall be charged thereon in respect of each fractional part of 100*l.*, as well as in respect of every full sum of 100*l.*, which shall be thereby insured upon any separate and distinct interest.			
And for every policy of assurance or insurance, or other instrument whereby any such insurance shall be made for any certain term or period of time, the following rates for every 100*l.*, and also for any fractional part of 100*l.*, whereof the same shall consist, viz.—			
Where any such insurance shall be made for any period not exceeding 6 calendar months -	0	2	6
Exceeding 6 calendar months -	0	4	0
And for every policy of assurance or insurance, or other instrument, whereby any insurance, commonly called a *mutual insurance*, shall be made, or whereby divers persons shall insure or agree to insure one another without any premium or pecuniary consideration from any loss, damage, or misfortune that may happen to any vessel, or any goods, or property on board of any vessel, or the freight of any vessel, or any other interest relating to any vessel which may lawfully be insured upon any voyage whatever, and not for any period of time.			
For every 100*l.*, and also for each fractional part of 100*l.*, thereby insured to any person or persons -	0	2	6

If any person shall become an assurer upon any insurance in respect whereof any duty is by this act made payable, or shall subscribe or underwrite, or otherwise sign or make or enter into any contract, agreement, or memorandum of any such insurance, or shall receive or contract for any premium or consideration for any such insurance, or shall receive or charge or take credit in account for any such premium or consideration, or any sum of money for any such premium or consideration as aforesaid, or shall wilfully or knowingly take upon himself any risk, or render himself liable to pay, or shall pay, or allow or agree to pay, or allow in account or otherwise, any sum of money upon any loss, peril, or contingency relative to any such insurance, unless such shall be written on vellum, parchment, or paper duly stamped, or if any person be concerned in any fraudulent contrivance or device, or shall be guilty of any wilful act, neglect, or omission with intent to evade the duties payable under this act on policies of insurance, or whereby any such duties shall be evaded, every person so offending shall for every such offence forfeit 100*l.*: provided, that nothing herein shall extend to subject any member, officer, or servant of the London Assurance or Royal Exchange Assurance Corporations respectively to any of the penalties by this act imposed, for his making any agreement to insure by any label, slip, or memorandum in writing upon unstamped paper; provided that in every such case the day on which such agreement shall be made shall be truly expressed in words at length on such label, slip, or memorandum, and a policy of insurance according to such agreement shall be made out in due form on vellum, parchment, or paper duly stamped, and which shall be duly executed within 3 office days from the time of making such agreement.

This duty was reduced in 1833, and again in 1844, and is now less than half what it was formerly. This reduction must, of course, be beneficial. But the tax is altogether wrong in principle, and should be repealed altogether. Its obvious tendency is to discourage the coasting trade, by imposing a duty on goods carried by sea, from which those carried by land and canals are exempted. But the influence of the tax on vessels engaged in the foreign or colonial trade is still more objectionable. It is immaterial to a merchant sending a ship to sea, whether he insure her in London, Amsterdam, or Hamburg; and as policies executed in the last two cities are either wholly exempted from duties, or subject to such as are merely nominal, the effect of the duty is to transfer to the Continent a considerable part of the business of marine insurance, that would otherwise be transacted in London. It is plain, therefore, that this duty operates to drive a valuable branch of business from amongst us; and though it had no such effect, still it is sufficiently clear that a tax on providence, or on the endeavour to guarantee the safety of property at sea, is not one that ought to exist in any country, and least of all in so commercial a country as England.*

Form of a Policy of Insurance executed at Lloyd's.

S. G.

£800.

In the Name of God, Amen. Charles Brown and Co., as well in their own names as for and in the name and names of all and every other person or persons to whom the same doth, may, or shall appertain, in part or in all, doth make assurance, and cause themselves and them and every of them to be insured, lost or not lost, at and from Petersburg to any port or ports in the United Kingdom, upon any kind of goods and merchandises, and also upon the body, tackle, apparel, ordnance, munition, artillery, boat, and other furniture, of and in the good ship or vessel called the Swift, whereof is master, under God, for this present voyage, Bright, or whoever else shall go for master in the said ship, or by whatsoever other name or names the said ship, or the master thereof, is or shall be named or called; beginning the adventure upon the said goods and merchandises from the loading thereof on board the said ship
upon the said ship, &c.

and so shall continue and endure during her abode there, upon the said ship, &c. And further, until the said ship, with all her ordnance, tackle, apparel, &c. and goods and merchandises whatsoever, shall be arrived at her final port of discharge (as above), upon the said ship, &c., until she hath moored at anchor twenty-four hours in good safety; and upon the goods and merchandises, until the same be there discharged and safely landed. And it shall be lawful for the said ship, &c. in this voyage, to proceed and sail to, and touch, and stay at any ports or places whatsoever, *without* prejudice to this insurance. The said ship, &c. *goods and merchandises*, &c. for so much as con-

* This very valuable article (on Marine Insurance) has been, as the reader will easily perceive, furnished by a gentleman thoroughly conversant with the principles and details of the business.

cerns the assured, by agreement between the assured and assurers in this policy, are and shall be valued at eight hundred pounds, being on the captain's one fourth share of said ship, said one fourth share valued at that sum. Touching the adventures and perils which we the assurers are contented to bear, and do take upon us in this voyage: they are of the seas, men-of-war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprisals, takings at sea, arrests, restraints, and detainments of all kings, princes, and people, of what nation, condition, or quality soever, barratry of the master and mariners, and of all other perils, losses, and misfortunes, that have or shall come to the hurt, detriment, or damage of the said goods and merchandises and ship, &c. or any part thereof; offences against the revenue of the United Kingdom of Great Britain or Ireland excepted. And in case of any loss or misfortune, it shall be lawful for the assured, their factors, servants, and assignees, to sue, labour, and travel for, in, and about the defence, safeguard, and recovery of the said goods and merchandises and ship, &c. or any part thereof, without prejudice to this insurance; to the charges whereof we the assurers will contribute, each one according to the rate and quantity of his sum herein assured. And it is agreed by us, the insurers, that this writing, or policy of insurance, shall be of as much force and effect as the surest writing or policy of assurance heretofore made in Lombard Street, or in the Royal Exchange, or elsewhere in London. And so we the assurers are contented, and do hereby promise and bind ourselves, each one for his own part, our heirs, executors, and goods to the assured, their executors, administrators, and assigns, for the true performance of the premises, confessing ourselves paid the consideration due unto us for this assurance by the assured, at and after the rate of five guineas per cent., to return one pound per cent. if the voyage end on the east coast of England.

In Witness whereof, we, the assurers, have subscribed our names and sums assured in London.

N. B. — Corn, fish, salt, fruit, flour, and seeds, are warranted free from average, unless general, or the ship be stranded.—Sugar, tobacco, hemp, flax, hides, and skins are warranted free from average under five pounds per cent.: and all other goods, also the ship and freight, are warranted free from average under three pounds per cent., unless general, or the ship be stranded.

£900. Joseph White, Five hundred pounds. 1st of Sept. 1855.

£300. Thomas Black by George Green, Three hundred pounds. 1st of Sept. 1855.

Policy by the Indemnity Mutual Marine Assurance Company. Established 1824.

£5,000. Whereas William Grey hath represented to us whose hands and seals are hereunto subscribed and affixed, and who are two of the directors of the Indemnity Mutual Marine Assurance Company, that he is interested in, or duly authorised as owner, agent, or otherwise, to make the assurance hereinafter mentioned and described, with the Indemnity Mutual Marine Assurance Company and hath covenanted or otherwise obliged himself to pay forthwith for the use of the said Company, at the office of the said Company, the sum of sixty-two pounds ten shillings as a premium or consideration, at and after the rate of twenty-five shillings per cent. for such assurance. Now this Policy of Assurance witnesseth, that in consideration of the premises and of the said sum of sixty-two pounds ten shillings, We do, for ourselves and each of us, covenant and agree with the said William Grey, his executors, administrators, and assigns, that the capital stock and funds of the said Company, shall, according to the provisions of the deed of settlement of the said Company, and the resolutions entered into at two extraordinary general courts of the said Company held on the twenty-ninth day of August, and the twentieth day of September, one thousand eight hundred and twenty-seven, be subject and liable to pay and make good, and shall be applied to pay and make good all such losses and damages herein-after expressed as may happen to the subject matter of this policy, and may attach to this policy in respect of the sum of five thousand pounds hereby assured, which assurance is hereby declared to be upon

Stamp £6. 5s. C 1/ 250. 250 hhds. of sugar valued at 20*l.* each, average payable upon each 10 hhds. following landing numbers, the same as if separately insured, laden or to be laden on board the ship or vessel called the Nelly, whereof Turner is at present master, or whoever shall go for master of the said ship or vessel, lost or not lost, at and from Grenada to London, including the risk of craft to and from the vessel, warranted to sail on or before the 1st of August, 1855. And We do covenant and agree, that the assurance aforesaid shall commence upon the said ship, at and from Grenada, and until she hath moored at anchor twenty-four hours in good safety; and upon the freight and goods or merchandise on board thereof, from the loading of the said goods or merchandise on board the said ship or vessel at London, and until the said goods or merchandise be discharged and safely landed at.

And that it shall be lawful for the said ship or vessel to proceed and sail to, and touch, and stay at any ports or places whatsoever, in the course of her said voyage, for all necessary purposes, without prejudice to this assurance. And touching the adventures and perils which the capital stock and funds of the said Company are made liable unto, or are intended to be made liable unto, by this assurance, they are, of the seas, men-of-war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprisals, takings at sea, arrests, restraints, and detainments of all kings, princes, and people, of what nation, condition, or quality soever; barratry of the master and mariners, and of all other perils, losses, and misfortunes, that have or shall come to the hurt, detriment, or damage of the aforesaid subject matter of this assurance, or any part thereof. And in case of any loss or misfortune, it shall be lawful to the assured, their factors, servants, and assigns, to sue, labour, and travel for, in, and about the defence, safeguard, and recovery of the aforesaid subject matter of this assurance, or any part thereof, without prejudice to this assurance, the charges whereof the capital stock and funds of the said Company shall bear in proportion to the sum hereby assured. And it is declared and agreed, that corn, fish, salt, fruit, flour and seed, shall be and are warranted free from average unless general, or the ship be stranded; and that sugar, tobacco, hemp, flax, hides, and skins, shall be and are warranted free from average under five pounds per centum; that all other goods, also the ship and freight, shall be and are warranted free from average under three pounds per centum, unless general, or the ship be stranded. Provided Nevertheless, that the capital stock and funds of the said Company shall alone be liable, according to the provisions of the deed of settlement, and the resolutions above-mentioned, to answer and make good all claims and demands whatsoever, under or by virtue of this policy; and that no proprietor of the said Company, his or her heirs, executors or administrators, shall be in anywise subject or liable to any claims or demands, nor be in anywise charged by reason of this policy beyond the amount of his or her share or shares in the capital stock of the said Company, it being one of the original or fundamental principles of the said Company, that the responsibility of the individual proprietors shall, in all cases, be limited to their respective shares in the said capital stock.

In Witness whereof, We have hereunto set our hands and seals in London, the tenth day of January, 1855.

Sealed and delivered in the presence of E. F.

A. B. (L. S.)
C. D. (L. S.)

III. Insurance (Fire).

Insurance against fire is a contract of indemnity, by which the insurer, in consideration of a certain premium received by him, either in a gross sum or by annual payments, undertakes to indemnify the insured against all loss or damage he may sustain in his houses or other buildings, stock, goods, and merchandise, by fire, during a specified period.

Insurances against fire are almost invariably made by Joint Stock Companies, of which there are one or more in all the considerable towns, with few exceptions, throughout the empire. Of these, the *Sun*, *Phœnix*, &c. insure at their own risk and for their own profit: but there are others, which are called mutual insurance offices, such as the Norwich Union, County, Westminster, &c., in which every person insured becomes a member or proprietor, and participates in the profit or loss of the concern.

The conditions on which the different offices insure are contained in their *proposals*, which are printed on the back of every policy; and it is in most instances expressly conditioned, that they undertake to pay the loss, not exceeding the sum insured, "*according to the exact tenor of their printed proposals.*"

Nothing can be recovered from the insurers, in the event of loss, unless the party insuring had an interest or property in the thing insured at the time when the insurance was effected, and when the loss happened. It often occurs that one office will not insure to the full amount required by an individual who has a large property; and in such case the party, to cover his whole interest, is obliged to insure at different offices. But, in order to prevent the frauds that might be practised by insuring the full value in various offices, there is, in the proposals issued by all the companies, an article which declares, that persons insuring must give notice of any other insurance made elsewhere upon the same houses or goods, that the same may be specified and allowed by indorsement on the policy, in order that each office may bear its rateable proportion of any loss that may happen: and unless such notice be given of each insurance to the office where another insurance is made on the same effects, the insurance made without such notice will be void.

Any trustee, mortgagee, reversioner, factor, or agent, has sufficient interest in the goods under his custody, to effect a policy of insurance, provided the nature of such interest be distinctly specified at the time of executing such policy.

Most of the offices stipulate in their proposals against making good any loss occasioned by "invasion," "foreign enemy," "civil commotion," &c.; and under this condition the Sun Fire Office was exonerated from the loss occasioned by the disgraceful proceedings of the mob in 1780.

The risk commences in general from the time the proposal is *accepted* by the office, unless there be some other time specified.

Policies of insurance may be effected for any period. If for a year (which is most customary) or for a term of years by a single payment, it is usual for the office, by way of indulgence, to allow fifteen days after each year, or term of years, for the payment of the premium for the next period in succession; and provided the premium be paid within that time, the insured is considered within the protection of the office.

A policy of insurance is not in its nature assignable, nor can it be transferred without the *express consent* of the office. When, however, any person dies, his interest remains in his executors or administrators respectively, who succeed or become entitled to the property, provided such representatives respectively procure their right to be indorsed on the policy.

(For further details, see *Marshall on Insurance*, book iv.; *Park on Insurance*, c. 23.)

Insurances are generally divided into *common*, *hazardous*, and *doubly hazardous*. The distinguishing characteristics of these may be learned from the subjoined proposals of the Sun Fire Office. The charge for insuring property of the first description is now usually 1*s.* 6*d.* per cent., the second 2*s.* 6*d.*, and the third 4*s.* 6*d.* These charges are exclusive of the duty payable to government of 3*s.* per cent. on the amount of the policy. There is also a stamp duty of 1*s.* on each policy, which is borne by the office.

We subjoin a copy of a policy of insurance on a house valued at 1000*l.* and furniture, plate, hooks, &c. in the same, valued also at 1000*l.*, executed by the Sun Fire Office, and of the proposals and conditions endorsed on the same.

The latter correspond in most particulars with those issued by the other offices.

No. ——

Whereas A. B. Esq. of No. —— Street, has paid the sum stated in the margin of this policy to the Society of the Sun Fire Office in London, and has agreed to pay, or cause to be paid to them, at their said office, the sum of one pound and sixteen shillings on the 29th of September yearly, during the continuance of this policy, for insurance from loss or damage by fire, on

	£
His now dwelling-house and offices, all communicating, situate as aforesaid, brick	1000
Household goods, wearing apparel, printed books, and plate therein only	760
Musical instruments therein only	40
Pictures and prints therein only	90
China and glass therein only	110
	£2000

Now, know ye, That from the date of these presents, and so long as the said assured shall duly pay, or cause to be paid, the said sum at the times and place aforesaid; and the trustees or acting members of the said Society for the time being shall agree to accept the same; the stock and fund of the said Society shall be subject and liable to pay to the said assured, his executors, administrators, and assigns, all such damage and loss which the said assured shall suffer by fire, not exceeding upon each head of insurance, the sum or sums above-mentioned, amounting in the whole to no more than two thousand pounds, according to the exact tenor of their printed proposals, endorsed on this policy, and of an act of parliament of the 55th of George the Third, for charging a duty on persons whose property shall be insured against loss by fire. In Witness whereof, we (three of the trustees or acting members for the said Society) have hereunto set our hands and seals, the 1st day of November, 1854.

Signed and sealed (being stamped according to act of parliament) in the presence of G. H.

N.B.—The interest in this policy may be transferred by indorsement, made and entered at the office, if the trustees or acting members approve thereof, but not otherwise.

(INDORSEMENT ON THE POLICY.)

SUN FIRE OFFICE.

This office insures against loss or damage by fire, in Great Britain and Ireland, and also in foreign countries, all descriptions of buildings, including mills and manufactories, and goods, wares, and merchandise, in the same; ships in harbour, or in dock; craft on navigable rivers and canals, and the goods laden on the same; wagons travelling the roads, and their contents; and farming stock of all descriptions, upon the following terms and conditions:—

Common Insurances.

1. Buildings covered with slates, tiles, or metals, and built on all sides with brick or stone, or separated by party-walls of brick or stone, and wherein no hazardous trade or manufacture is carried on, or hazardous goods deposited.

2. Goods in buildings as above described, such as household goods, plate, jewels in private use, apparel, and printed books; liquors in private use, merchandise, stock and utensils in trade, not hazardous.

At 1*s.* 6*d.* per cent. per annum, with certain exceptions.

Hazardous Insurances.

1. Buildings of timber or plaster, or not wholly separated by partition-walls of brick or stone, or not covered with slates, tiles, or metals; and buildings falling under the description of common insurance, but in which hazardous goods are deposited or some hazardous trade or manufacture is carried on.

2. Ships and craft, with their contents (lime barges, with their contents, alone excepted).

At 2*s.* 6*d.* per cent. per annum, with certain exceptions.

Doubly Hazardous Insurances.

1. Buildings. — All thatched buildings having chimneys, or communicating with, or adjoining to, buildings having one, although no hazardous trade shall be carried on, nor hazardous goods deposited therein: and all hazardous buildings in which hazardous goods are deposited, or hazardous trades carried on.

2. Goods. — All hazardous goods deposited in hazardous buildings, and in thatched buildings having no chimney, nor adjoining to any building having a chimney.

At 4*s.* 6*d.* per cent. per annum, with certain exceptions.

Agricultural produce, farming stock, and implements and utensils of husbandry, on any farm, may be insured, without the average clause, exempt from duty, provided it be insured to a fair value. This office will not be subject to loss on goods or utensils damaged or destroyed whilst undergoing any process in which the application of fire-heat is necessary, nor will the office be liable for loss on hay, corn, seeds, or other property, occasioned by its own natural heating, but the loss on any property in consequence, (except that which, by its own natural heating, has been the cause of the fire), will be made good; as well as losses from lightning, where the buildings, or other effects insured, have been actually set on fire thereby.

Insurances may also be made by special agreement on the following risks, and on others of a similar description, not included in the 2d and 3d heads of insurances, viz. on mills of all kinds, and the stock and utensils in them; also on buildings, containing kiln, steam-engine, stove, or oven, used in the process of any manufacture, and the stock therein; sugar refiners, sea biscuit bakers, distillers, varnish makers, chemists' laboratories, theatres, coach painters, colour manufacturers, varnishers, musical instrument makers, refiners of saltpetre, spermaceti, wax, and oil, barge and boat builders, carpenters, cabinet makers, coach makers, coopers, cork burners, floor-cloth painters, japanners, lampblack makers, letter-press printers, machine makers, melters of tallow and of rough fat, candle makers, cart-grease makers, oilmen, soap-boilers, rope and sail makers, ship chandlers, hemp and flax dressers, oil leather dressers, medals, curiosities, pictures, prints, drawings, statuary work, spinners of cotton, flax, lint, and wool, throughout all the operations attending the manufacturing of these materials, from the raw state into thread for the weaver, and such other risks as, by reason of the nature of the trade, the narrowness of the situation, or other dangerous circumstances, may increase the hazard thereof: all which special hazards must be inserted in the policy, to render the same valid and in force.

N. B. — Gunpowder, and buildings in which it is made, cannot be insured on any terms; neither does this office insure writings of any kind, books of accounts, ready money, bonds, bills, or any other securities for money.

N. B. — By an act of the 55th of Geo. 3. a duty of 3*s.* per annum is to be levied on every 100*l.* of property insured against fire; but by an act of the 3d & 4th Will. 4. agricultural produce, farming stock, and implements and utensils of husbandry, are exempt from duty.

N. B.—Insurances may be made for more years than one by a single payment, and in such cases there will be a discount allowed on the premium and duty for every year except the first.

N. B. — Rent may be insured by a special agreement for a term not exceeding 1 year, the amount being specified in the policy. Persons insured in this office are not liable for any calls to make good losses.

CONDITIONS.

Art. I.—Any person desirous of effecting insurances upon buildings or goods must furnish the office, or its agents, with a particular description thereof, and of the process of manufacture, if any such process be carried on therein; and if there be any omission or misrepresentation in describing the building or goods, or process of manufacture, whereby the same may be charged at a different rate of premium than they otherwise would be, this office will not be responsible in case of any loss or damage. And if any alteration be made in the state of the buildings or goods, or process of manufacture, after such insurance shall have been effected, then the insured shall give due notice thereof, in writing, to the office or its agents, or in default of such notice, such insurance shall become void, and no benefit be derived therefrom.

Art. II.—All policies shall be signed and sealed by three or more trustees or acting members; and no receipts are to be taken for any premiums of insurance, but such as are printed and issued from the office, and signed by one of its clerks or agents.

Art. III.—Houses, buildings, and goods in trust, and merchandise on commission (except as aforesaid), may be insured, provided the same are declared in the policy to be in trust or on commission, but not otherwise.

Art. IV.—On bespeaking policies, all persons shall pay the premium to the next quarter day, and from thence for one year more at least, or shall make a deposit for the same, and shall, as long as the managers agree to accept the same, make all future payments annually at the said office, within fifteen days after the day limited by their respective policies, upon forfeiture of the benefit thereof.

Art. V.—Any number of houses and out-houses, and household goods, printed books, wearing apparel, plate, prints, jewels and trinkets in private use, stock in trade, goods in trust, or in commission, may be insured in one policy.

Art. VI. — Persons insured by this office shall receive no benefit from their policies, if the same houses, or goods, &c. are insured in any other office, unless such insurance, and the amount thereof, be first specified and allowed by indorsement on the policy, in which case this office will pay its rateable proportion on any loss or damage.

Art. VII. — When any person dies, the policy and interest therein shall continue to the heir, executor, or administrator, respectively, to whom the right of the property insured shall belong, provided, before any new payment be made, such heir, executor, or administrator do procure his or her right to be indorsed on the policy at the said office, or the premium to be paid in the name of the said heir, executor, or administrator.

Art. VIII. — Persons changing their habitations or warehouses may preserve the benefit of their policies, if the nature and circumstance of such policy be not altered; but such insurance will be of no force till such removal or alteration is allowed at the office, by indorsement on the policy.

Art. IX.— No loss or damage will be paid on fire happening by any invasion, foreign enemy, riot, civil commotion, or any military or usurped power whatever.

Art. X. — Persons insured sustaining any loss or damage by fire are forthwith to give notice thereof at the office; and, as soon as possible afterwards, deliver in as particular an account of their loss or damage as the nature of the case will admit of, and make proof of the same by their solemn declaration, according to the form practised in the said office, and by their books of accounts, or such other proper vouchers as shall be reasonably required, until the production of which, the loss money shall not be payable. And if there appear any fraud or false-swearing, or that the fire shall have happened by the procurement, or wilful act, means, or contrivance of the insured or claimants, he, she, or they shall be excluded from all benefit from their policies. And, in case any difference shall arise between the office and the insured, touching any loss or damage, such difference shall be submitted to the judgment and determination of arbitrators, indifferently chosen, whose award in writing shall be conclusive and binding on all parties, and in every case of loss the company reserves the right of reinstatement in preference to the payment of claims, if it should judge the former course to be more expedient; but when any loss is settled and adjusted, the insured will receive immediate payment for the same, without any deduction or discount.

Insurance of Mills, Factories, &c.— The principal insurance offices agreed, in 1842, upon certain rates for the insurance of cotton, woollen, flax, and other mills and factories. We subjoin a table of the rates for cotton mills; but the others are too voluminous, and embrace too many particulars to be given in this place. The rates for woollen mills may, however, be considered as varying from 8*s.* to 10*s.* per cent. and upwards; and those for flax mills 12*s.* per cent. and upwards, subject to a discount of 15 per cent. thereon.

Rates for Cotton Mills. (England.)

	Not Fire-proof.		
	Class I. Not spinning lower than 80's.	Class II. Not spinning lower than 34's.	Class III. Spinning lower than 34's.
Cotton Mills conforming to the following description, viz.			
1. Built of brick or *stone*, and covered with slate, tile, or metal			
2. In one tenure only			
3. Heated by steam			
4. The boiler and fire-place being *outside* the mill; or in a fire-proof compartment within the mill, but separated therefrom by an *iron* door			
5. Lighted by gas			
6. No internal communication by hoist, spout, well-hole, or otherwise through the floors			
7. Working single time only (viz. during the hours from 5 A.M. to 8 P.M. only, or by one set of adult hands only each day)			
8. No process previous to carding (except mixing by hand only) being performed within the mill			
Or if the processes previous to carding are performed in a detached building			
Or if in a building *separate* from the mill, but communicating by an *external fire-proof gangway* of not less than 10 feet in length, with an iron door at each end thereof, no window in the mill overlooking the blowing room, &c.			
Or if in a building adjoining and communicating only by holes of not more than sufficient size to admit the shafts, straps, and steam and gas pipes—no window in the mill overlooking the blowing room, &c., nor any window or opening in the blowing-room walls so as to endanger the mill	9*s.*	11*s.*	14*s.*
Or if in a building adjoining and communicating by holes of not more than sufficient size to admit the shafts, straps, and steam and gas pipes—no window in the *mill* overlooking the blowing-room, &c., nor any window or opening in the blowing-room walls, so as to endanger the mill—and communicating by an *external fire-proof gangway* of not less than 10 feet in length, with an iron door at each end thereof			
Or if in a building communicating by a gangway (not fire-proof) exceeding 21 feet in length, with an iron door at each end thereof			
Or if in a *fire-proof* building nearer than 10 feet to the mill, having a blank wall towards the mill and no communication therewith			
Or if in a *fire-proof* building adjoining to the mill, and communicating with it by a stone staircase, having a wrought-iron door only, set in stone or metal, and by aperture for shaft and steam-pipe as aforesaid			
9. Not spinning waste other than that produced by the occupier of the mill			
10. Not containing more than six floors in height, including basement and attics			
Staircases, whether of stone or wood, are allowed without charge.			
Mills not conforming to the above description will be charged in addition to the above, viz.			
As to No. 2. If in the occupation of two tenants	3*s.*	4*s.*	5*s.*
Mem.—When a mill is occupied by two or more tenants carrying on the same processes or others of equal hazard, these additional rates will apply; but it shall be at the discretion of each office to charge such extra rate for plurality of tenure as it may think proper, *in those cases only* where the additional trade or process carried on is of a less degree of hazard than that charged for under this tariff.			
As to No. 3. If heated otherwise than by steam	Special.	Special.	Special.
As to No. 4. If the boiler or fireplace is *within* the mill, except in a fire-proof compartment as above described	1*s.*	1*s.*	1*s.*
As to No. 5. If lighted otherwise than by gas	2*s.*	3*s.*	4*s.*
As to No. 6. If having therein any hoist, well-hole, spout, or other communication through the floors of the mill	1*s.*	1*s.*	2*s.*
As to No. 7. If working more than single time	1*s.*	3*s.*	3*s.*
Mem.—Any mill which may be worked between the hours of 8 in the evening and 5 in the morning, or by more than one set of adult hands each day, will be liable to the charge for "working more than single time."			
As to No. 8. If any of the processes previous to carding be performed			
In a fire-proof building adjoining to the mill, and communicating by wrought-iron doors set in stone or metal, and by apertures for shaft and steam-pipe as aforesaid	2*s.*	4*s.*	6*s.*
In a fire-proof room, *within the mill*, communicating by wrought-iron doors and apertures for shafts and steam-pipe as aforesaid	3*s.*	6*s.*	7*s.*
Not according to one or other of the above descriptions	5*s.*	7*s.*	9*s.*
As to No. 9. If spinning bought flyings or strippings	Special.	1*s.*	1*s.*
If spinning other bought waste	Special.	Special.	Special.
The additional rates under "As to No. 9." will only apply to those mills which are subject to any charge for preparatory processes, and to blowing houses.			
As to No. 10. If containing more than six floors in height, including basement and attics	1*s.*	1*s.*	1*s.*
Mem.—The assured may have permission, on payment of 1*s.* per cent. extra, to spin *occasionally, and upon not more than four mules or frames* at any one time, for the purpose of making up an order, yarns of lower numbers than 34 hanks (*or* 80 *as the case may be*), provided *the same preparation of cotton only* be used as is required for the ordinary production of the mill.			

Fire-proof Mills.—Each floor (building and contents) to be rated as mills of ordinary construction according to the numbers spun and the processes performed therein. If *weaving only* be done on a floor of a fire-proof mill, that floor to be charged 7*s.* 6*d.* per cent. per annum. If insured in one sum with the average clause, special. *N.B.* In fire-proof mills with a sum insured on each floor, the extra charge for height will only apply to the stories above six. Mills are denominated fire-proof in the construction of which no timber is used, except in the roof. If any part of the mill has a wooden flooring, that story, and the one below it, will be charged the highest rate applicable to either.

Spinning Mills, in which *no roving*, nor any process preparatory thereto is carried on,—class 1., 7*s.* 6*d.*; class 2., 9*s.*; class 3., 10*s.* 6*d.*; subject to such of the above-mentioned additions as apply thereto.

Blowing-houses, &c.—Buildings in which any processes preparatory to carding is carried on, to be charged the maximum

rate according to the number of hanks to the pound to be spun from the cotton prepared in them.

Cotton mills having more than two tenants, or otherwise not included in the above several classifications, will be considered special.

Sheds.—Sheds used as cotton mills, having only a ground floor, class 1., 7*s.* 6*d.*; class 2., 9*s.*; class 3., 10*s.* 6*d.*: with the additional rates above given for ordinary mills.

Power-loom Factories and Sheds.—Detached, brick-built and tiled or slated, heated by steam, in single tenure, 6*s.* per cent. per annum. If adjoining to, but not communicating with a cotton mill, special, but not less than 7*s.* 6*d.* per cent. per annum. If communicating with a cotton mill, the same rate as the mill.

No return of premium will be allowed on account of the working of a mill being suspended during intermediate portions of the term for which the insurance is effected.

The above rates are to be applied to all existing insurances as they become due, as well as to new orders.

Discounts.—The following discounts will be allowed upon the rates charged under this tariff:—On cotton mills, 1st class, not spinning lower than 80's, 20 per cent.; 2nd and 3rd classes, 15 per cent.; on power-loom factories, 15 per cent.

Amount of Property insured. Duty.—Insurance against fire, though practised in France, Holland, and some other countries, is not general any where except in Great Britain. It has been known amongst us for a century and a half, and is now very widely extended. It appears from the official accounts, that the *gross* duty received on policies of insurance against fire in the United Kingdom, in 1852, amounted to 1,162,913*l.*, which, as the duty is 3*s.* per cent., shows that the property insured was valued at the immense sum of 775,275,000*l.* But notwithstanding the magnitude of this sum, it is still true that most buildings are not insured up to their full value; even in towns, many are not insured at all; and in the country it is far from being customary to insure farm buildings or barn-yards. It is difficult to imagine that this can be owing to any thing other than the exorbitance of the duty. On common risks the duty is no less than 200 per cent. upon the premium; or, in other words, if a person pay to an insurance office 15*s.* for insuring 1,000*l.* worth of property, he must at the same time pay a duty of 30*s.* to government! On hazardous and doubly hazardous risks, the duty varies from about 120 to 75 and 80 per cent. upon the premium. Such a duty is in the last degree oppressive and impolitic. There cannot, in fact, be the slightest doubt that, were it reduced, as it ought to be, to *one third* its present amount, the business of insurance would be very much extended; and as it could not be extended without an increase of security and without lessening the injurious consequences arising from the casualties to which property is exposed, the reduction of the duty would be productive of the best consequences in a public point of view; while the increase of business would prevent the revenue from being materially diminished.

During the session of 1833, the duty on the insurance of farming stock was repealed. But the relief thence arising is immaterial; and the repeal is, besides, highly objectionable in point of principle, inasmuch as there is no ground whatever for exempting farming stock from duty in preference to any other description of stock. A duty on

insurance is not, in itself, objectionable. We do not wish to see it repealed, but to have it effectually reduced. Were it fixed at 1s. per cent., it would hardly be felt as a burden; while the revenue would suffer little or nothing from the measure.

* One Quarter. † Two Quarters. ‡ Three Quarters.

No fewer than 69 fire offices, chiefly those of recent formation, have discontinued their fire insurance business.

IV. Insurance (Life).

That part of the business of life insurance which consists of granting annuities upon lives, is treated of under Interest and Annuities; so that we have only to treat, in this place, of the insurance of sums payable at the death of the insurers or their nominees.

Suppose an individual of a given age wishes to insure 100*l.* payable at his death, the single premium, or the series of annual premiums, he ought to pay an office for such insurance, must plainly depend on the expectation of life of such individual, and on the rate of interest or nett profit which the insurers may make by investing the premiums.

With respect to the first of these conditions, or the *expectation of life*, it is usual in estimating it to have recourse to Tables framed from the mortality observed to take place in particular cities or districts, as in Northampton, Carlisle, &c.—(See Interest and Annuities.) But though the actual decrement and expectation of life among an average population, at every year of their lives, were accurately determined, it is doubted whether it would form a fair basis for an insurance office to proceed upon. The general opinion seems to be, that insured lives are decidedly above the average; for insurance offices invariably profess to act on the principle of rejecting bad lives or of making them pay a proportional increase of premium; and it may besides, it is said, be fairly presumed that persons insuring their lives are of a superior class, and are not, generally speaking, engaged in those manual and laborious occupations that are esteemed most injurious to health. But, on the other hand, the friends of parties whose lives are supposed to be bad, and the parties themselves, are most anxious they should be insured. It is also far from being an uncommon practice, for certain individuals to prevail on persons whom they happen to know, or believe to be bad lives, to insure; and then to get a legal assignment of the policy in their favour, on their giving the "men of straw" a bonus for their share in the fraud. At all events, there can be no question that large numbers of such lives are perpetually offered for insurance; and every individual conversant with the business knows that, in despite of all precautions, policies are very frequently effected upon them. Mr. Milne, on whose judgment every reliance may be placed, states distinctly that "all the caution and selection which the

offices in general can exercise, is necessary to keep the lives insured up to the average goodness of the bulk of the population."—(*Ency. Brit.* new ed. art. *Annuities.*) Since the competition among the different offices became so very keen as it has been of late years, there are but few lives so bad that they will not be taken by one office or another; and we doubt, were the results of their experience made public, whether it would be found that there is much foundation for the opinion as to the superiority of insured lives.

With respect to the second condition in valuing an insurance, or the rate at which the interest of money may be estimated, it is impossible to arrive at any thing like accurate conclusions. At an average, perhaps, transactions in life insurance may extend over a period of 30 years from the time when they are entered into; and in such a lengthened term the greatest changes may take place in the rate of profit and the rate of interest. Mr. Finlaison, of the National Debt Office, appears to think that $4\frac{1}{2}$ per cent. may be taken as the true average rate in this country; and that $4\frac{1}{4}$ is a rate at which no loss need be apprehended. – (*Parl. Paper*, No. 284. Sess. 1829.). But this is not a point on which (as Mr. Finlaison seems to suppose) previous experience can be safely depended upon in forming engagements for the future; and were this the proper place for entering upon such discussions, we think we could assign pretty solid grounds for concluding that no institution, intended to last for the next half century, would be warranted in reckoning upon realising more than 3 per cent. upon its investments. We should look upon this as the *maximum*, and of course could expect nothing but ruin to fall upon any institution founded upon the hypothesis of realising $4\frac{1}{4}$ per cent. of interest. At the same time, we would not be understood as laying any undue stress upon this opinion; and are ready to admit that there must always be more of conjecture than of certainty in such conclusions.

Security being the principal object to be aimed at by every insurance office established on sound principles, they would not act wisely, if they did not calculate their premiums considerably higher than may appear necessary to those who look only at what has taken place during the last 30 or 40 years. Societies contracting prospective engagements that may extend for half a century or more are exposed to innumerable unforeseen contingencies; and they would be highly censurable, and altogether unworthy of the public confidence, were they so to conduct their affairs, that they might be liable to serious embarrassments from fluctuations in the rate of interest, or an increase of sickness, or any other cause. The success that has hitherto attended the Equitable, and some of the long-established offices, must not be taken as any criterion of what may befall them and others during the next 100 years. Mr. Morgan, the late able actuary of the Equitable, in his account of the rise and progress of that institution, published in 1828, has satisfactorily shown that its peculiar prosperity has been in a very great degree owing to circumstances which cannot possibly occur again. The premium, for example, charged by the Society, so late as 1771, for insuring 100*l.* on the life of a person aged 30, was 4*l.* 1*s.* $5\frac{1}{2}$*d.*, whereas it is now only 2*l.* 13*s.* 4*d.*; and there was a corresponding difference in the premiums for other ages. —(p. 36.) But the excessive magnitude of the premiums was not the only extraordinary source of profit enjoyed by this Society in the earlier part of its career. We learn from the same unquestionable authority, that *half the insurances made during the first twenty-five years of the Society's existence were abandoned by the insurers*, in many cases, after the premiums upon them had been paid for a considerable number of years, *without any valuable consideration being given for them by the Society!*—(p. 38.) So copious a source of profit was alone adequate to enrich any society; but such things rarely occur now,—people are become too familiar with life insurance, and sales of policies are of too frequent occurrence, to allow any office to realise any thing considerable in this way. Now, we ask, can any one who takes these facts into view, and couples them with the frugal and cautious management which has hitherto always distinguished the Equitable Society, be surprised at its success? and can any thing be more absurd than to appeal to its experience in casting the horoscope of the societies that have sprung into existence within the last few years? But, independently of these considerations, there are other circumstances sufficient to account for the great success of some of the old offices. Since the close of the American war, a very decided diminution has taken place in the rate of mortality; the public tranquillity has neither been disturbed by foreign invasion nor intestine commotion; cholera excepted, we have not been once visited by any epidemic disorder; and the investments in the funds, during the war made at from 50 to 60, may now be realised at from 80 to 90. We do not to presume to say that circumstances may not be even more advantageous for the insurance offices during the next half century; but we should not, certainly, think very highly of the prudence of those who proceeded to insure on such an assumption. Security, we take leave again to repeat, is, in life insurance, the paramount consideration. It is, we believe, admitted on all hands, that the premiums were at one time too high; but we doubt whether the

tendency at present be not to sink them too low. A great relaxation has taken place, even in the most respectable offices, as to the selection of lives. And the advertisements daily appearing in the newspapers, and the practices known to be resorted to in different quarters to procure business, ought to make every prudent individual consider well what he is about before he decides upon the office with which he is to insure. Attractive statements, unless where they emanate from individuals of unquestionable character and science, ought not to go for much. Life insurance is one of the most deceptive of businesses; and offices may for a long time have all the appearance of prosperity, which are, notwithstanding, established on a very insecure foundation. If a man insure a house or a ship with a society, or an individual, of whose credit he gets doubtful, he will forthwith insure somewhere else. But life insurance is quite a different affair. The bargain is one that is not to be finally concluded for, perhaps, 50 years; and any inability on the part of an establishment in extensive business to make good its engagements, would be productive of a degree of misery not easy to be imagined.

Life insurance companies are divided into three classes. The first class consists of joint stock companies, who undertake to pay *fixed* sums upon the death of the individuals insuring with them; the profits made by such companies being wholly divided among the proprietors. The second class are also joint stock companies, with proprietary bodies; but instead of undertaking, like the former, to pay certain specified sums upon the death of the insured, they allow the latter to participate, to a certain extent, along with the proprietors, in the profits made by the business. The mode in which this sort of *mixed* companies allot the profits granted to the insured is not the same in all; and in some, the principle on which the allotment is made is not disclosed. The Rock, Sun, Royal Exchange, Globe, Alliance, Guardian, Atlas, &c. belong to this mixed class. The third species of company is that which is formed on the basis of mutual insurance. In this sort of company there is no proprietary body distinct from the insured; the latter share among themselves the whole profits of the concern, after deducting the expenses of management. The Equitable Society, the Amicable, the Norwich Life, &c. belong to this class.

The advantage to a person insuring in any one office as compared with another, must plainly depend on a comparison between the premiums demanded, the conditions of the policy, and, above all, the security which it holds out. It may appear, on a superficial view, as if the mutual insurance companies would be in all respects the most eligible to deal with, inasmuch as they have no proprietors to draw away any share of the profits from the insured. It is doubtful, however, whether this advantage be not more than balanced by disadvantages incident to such establishments. Every one being a partner in the concern, has not only his own life insured, but is part insurer of the lives of all the other members, and may in this capacity, should the affairs of the society get into disorder, incur some very serious responsibilities. The management, too, of such societies, is very apt to get into the hands of a junto, and to be conducted without the greater number of those interested knowing any thing of the matter. There is, also, considerable difficulty, in constituting such societies, in distinguishing clearly between the rights of old and new members; for supposing a society to be prosperous, it is but reasonable that those who have belonged to it while it has accumulated a large fund, should object to new entrants participating in this advantage. But the affairs of a society conducted in this way, or making distinctions in the rights of the members during a long series of years, could hardly fail of becoming at last exceedingly complicated; nor is it, indeed, at all improbable that the conflicting claims of the parties in some of the societies of this sort now in existence, may ultimately have to be adjusted in the courts of law, or by an act of the legislature.

Supposing the premiums demanded by the societies which retain the whole profits to themselves, to be fairly proportioned to the values insured, we should be inclined to think that they are, on the whole, the most advisable to insure in. The subscribed capital of such associations as the Royal Exchange, Sun, Globe, Scottish Union, &c., and the wealth of the partners (which is all liable, except in the case of the chartered companies, to the claims of the insured,) afford unquestionable security. Individuals dealing with them know exactly what they are about. They know the precise premiums they will have to pay, and the exact amount of the sums that will be paid to their assignees in the event of their death. They incur no responsibility of any kind whatever. For, unless some very unprecedented and unlooked-for change should take place in the condition of the country, they may reckon with certainty on the terms of the policy being fulfilled to the letter.

But, as already observed, every thing depends, in matters of this sort, on a comparison of the premium with the advantages to be realised. And where the premiums are believed, either through carelessness, or intentionally, in order to provide for the safety of the establishment, to be a little too high, it may be more expedient, perhaps, to deal with a mixed company. The subscribed capital and fortunes of the proprietary body

afford a guarantee on which the public may depend in dealing with any *respectable* company of this sort; while by receiving a share of the profits, the insured gain by the flourishing condition of the association, and it is of less consequence to them though the premiums should be too high.

It should, however, be borne in mind, that an individual insuring with a mixed company, on condition of his getting a proportion of the profits, becomes a *partner of such company;* and being so, incurs responsibilities. In dealing with such associations as the Alliance, the Rock, and a few others, this responsibility can hardly be said to amount to any thing. But there are companies of this class in the field, and holding out very tempting baits to the unwary, those insured in which may find, at some future period, that this responsibility is by no means a light matter.

A highly respectable company of this mixed class, with a large subscribed capital,—the Guardian,—inserts in all its policies the following condition, viz.—"That the responsibility of the individual members shall, in all cases, be limited to their respective shares." It may be doubted whether this condition be good in law; but if it be, it materially affects the security afforded by the company, which otherwise would justly claim a place in the very first class of offices. As no one attempts to secure himself against a contingency which he is satisfied cannot happen, the existence of a condition of this sort implies a doubt, on the part of the proprietary body, of the perfect solidity of the establishment. Such a doubt may be, and we believe really is, very ill-founded; but the public will, most likely, be inclined to think that the proprietors ought to know better than any one else. The Albion Assurance Company also inserts in its policies a condition to the same effect.

The allotment of profit to the insured made by the mixed companies, is sometimes effected by a diminution of the premiums, and sometimes by increasing the sum in the policy; and individuals should, in dealing with such societies, select, other things being equal, the association with which to insure, according as they wish to insure a large sum, or to get the premiums reduced.

We subjoin, from Mr. Babbage's work on *Life Assurance**, the following statement of the terms of the various mixed companies, as to the division of the profits with the insured. They are, for the most part, exceedingly vague. We also subjoin an account of the conditions, in respect of profits, under which new entrants are admitted into the Equitable.

Alliance.—At the periods of participation of the Company in the profits of its concerns, every policy for the whole term of life, which shall have paid 5 entire annual premiums, shall, if the allowance be made in reduction of annual premium, be entitled to such reduction from the original charge as shall, then, and from time to time, be declared; but if the allowance be in addition to the amount assured, that addition shall also be continually declared from time to time.

Persons assuring their own lives have the option of declaring at the time of effecting the assurance, whether they will participate in the profits by an addition to their policy, or by a reduction of premium.

Atlas.—Persons assuring for the whole term of life for 100*l.* and upwards, in Great Britain and Ireland respectively, will be entitled, at the end of every 5th year, to participate in the surplus premiums, to be then ascertained by actual valuation.

Asylum.—The directors have power to divide such portion of the profits quinquennially as may not imprudently check the growth of the funds intended for the benefit of the assured.

Crown.—Two thirds of such profits as shall periodically be declared divisible, will be apportioned amongst assurers for the whole term of life, and may be applied to the reduction of the future annual premiums, or to the increase of the sum assured, as may be desired.

Economic.—At present 3-4ths of the savings and profits divided amongst the assured entitled to participate therein, by additions to their policies, proportioned to their respective contributions, and in order to afford them the immediate benefit of such additions, interest thereon applied annually in reduction of their premiums.

Equitable.—That in case any prospective addition shall hereafter be ordered to be made to the claims upon policies of assurance in this Society, such order shall not take effect with respect to any policy granted after the 31st of December, 1816, until the assurances existing in the Society prior in number and date to such policy, and if of the same date, prior in the number thereof, shall be reduced to 5,000; but as soon as such reduction shall have been ascertained, in manner hereinafter mentioned, the said policy shall be within the effect and operation of the order for such addition, as to the payments made thereon subsequent to such ascertained reduction; so that if such order should be made to take effect generally from the 1st of January, 1820, for the space of 10 years then next following, a policy effected in the year 1817 shall not be within the operation of such order, until the assurances existing prior to the number and date of the policy, as aforesaid, shall have been reduced to 5,000; but such policy shall be within the operation thereof from the time when the reduction shall have been ascertained, in manner hereinafter mentioned, as to the payments made thereon subsequent to such ascertained reduction. And the like as to other cases. And this by-law shall be considered as a part of every such order, and shall be virtually incorporated therein, although the same may not be thereby expressly referred to.

That in case any retrospective addition shall hereafter be ordered to be made to claims upon policies of assurance in this Society, such order shall not take effect with respect to any policy granted after the 31st of December, 1816, until the assurances existing prior in number and date, and if of the same date, prior in the number thereof, shall be reduced to 5,000; but when the said reduction shall have been ascertained in manner hereinafter mentioned, such policy shall be within the effect and operation, and entitled to the benefit of such order, with respect to every payment made thereon subsequent to such ascertained reduction; so that if such order shall be made to take effect generally as to payments made before the 1st of January, 1820, a policy effected in the year 1817 shall not be within the effect and operation thereof, unless the life assured shall exist, and the payments continue to be made, until the assurances existing in the Society prior to the number and date of the policy, as aforesaid, shall be reduced to 5,000; but as soon as such reduction shall have been ascertained, in manner hereinafter mentioned, such policy shall be within the effect and operation of such order for the several payments made thereon as aforesaid. And the like as to other cases. And this by-law shall be considered as a part of every such order, and be virtually incorporated therein, although the same may not be thereby expressly referred to.

That an inquiry be made on the 1st of April in every year in order to ascertain the number of assurances made and existing in the Society; and when it shall have been ascertained by such inquiry that the assurances existing prior to the 1st of January, 1817, were, on the 31st of December immediately preceding such inquiry, reduced below the number of 5,000, the actuary do report the same to the court of directors, who shall communicate such report to the quarterly general court, to be holden in the June following; and that as many of such policies as had been made subsequent to the 31st of December, 1816, and which were existing in the Society on the 31st of December immediately preceding such inquiry, be added, according to the priority in their dates and numbers, and if of the same date, according to the priority in their numbers, to those above mentioned, as shall be sufficient to complete the number to 5,000; and that the persons holding the policies so added shall be considered thenceforward as entitled to such additions as shall be thereafter made in respect of all the payments made subsequent to such ascertained reduction, and, under the same restrictions, to the same privileges of attending at the general courts, and of being eligible to the office of director.

That after the vacant numbers in the assurances existing in the Society on the 1st of January, 1817, shall have been filled up agreeably to the foregoing order, the actuary, on the 1st of

* This work of Mr. Babbage contains a good deal of useful information, intermixed, however, with not a few errors and mis-statements. It was most ably reviewed in the 90th Number of the *Edinburgh Review*.

April in every succeeding year, do ascertain the vacancies which have taken place in the preceding year in the policies constituting the 5,000 mentioned in the 5th resolution, and report the same to the court of directors, who shall communicate such report to the quarterly general court in the month of June following; and that as many policies shall be added, according to the priority of their dates and numbers, and if of the same date, according to the priority in their numbers, as shall be sufficient to complete the number to 5,000; and that the persons holding those policies shall thenceforward be considered as entitled to such additions as shall be thereafter made in respect of all payments made subsequent to the 31st of the preceding December, and, under the same restrictions to the same privileges of attending the general courts, and being eligible to the office of director.

Provided that nothing hereby ordered shall be construed to authorise an addition to the sum assured by any policy, upon which policy the number of payments required in that respect by the present by-laws of the Society shall not have been made.

N. B. — Those by-laws require that 6 annual payments at the least shall have been made before any addition to a claim can take place; and when such payments shall have been made, the party will be qualified to be received, in his turn, into the number of persons entitled to additions as aforesaid.

European. — The profits derived by this Company are distributed amongst the several persons connected with the establishment, according to the contingency or certainty of their contract.

Life insurers derive an immediate benefit by the reduction of the premiums generally taken, with the prospect of a liberal addition to their policies, or a further reduction of the premium, in 10 years.

Guardian. — Persons assured for the whole term of life will be entitled at the end of every 5 years to participate in the profits of the Company, after a deduction of such sum per annum, for the guaranty of the capital, as the directors may think reasonable; the extent of which is, however, limited by the deed of settlement.

The share of the profits to be so allowed to the insured may either be added to the amount of their respective policies, or the value thereof be applied in reduction of the premiums hereafter to be payable on such policies, provided such option be declared in writing within 3 calendar months next after the dividend shall have been declared; but if such option be not declared, such share of profits will be added to the amount of policies.

Hope. — The business of this office has been transferred to the Imperial.

Imperial. — Upon every policy effected for the whole term of life, the assured will participate in the profits of the Company, by having periodical additions made to the sums insured to the amount of 2-3d parts of such clear gains and profits.

Law Life. — At stated periods, the surplus of the fund arising from the premiums of assurance, and their accumulation beyond what may be thought necessary to answer the expected claims upon the Society, will be ascertained; and as large a portion of the savings as may be deemed consistent with the security of the institution, will be divided between the proprietors and the assured in the following manner: — 1-5th will be transferred to the proprietors' guaranty fund; and reversionary sums, equivalent to the remaining 4-5ths, will be added to the policies of those who shall have been 3 years assured for the whole term of life.

London Life Association. — The distinguishing principle of this Society is, that the benefits resulting from its transactions shall be enjoyed by the members during life, so as to render life assurance as easy to the assured as a due regard to security will admit.

Medical and Clerical. — Persons assured for the whole term of life will be entitled to share with the original proprietors the general profits of the business, in proportion to the amount of their respective assurances.

Norwich Union. — The whole of the surplus premiums is added at stated periods to the policies of the members, in proportion to the sums they have respectively contributed.

Palladium. — A general investigation of the affairs of the Society is to take place every 7th year, when 4-5ths of the declared profits of the life department will be appropriated by way of bonus or addition, to be placed to the credit of the policies then in force for the whole term of life, upon the most equitable principles of division.

Rock. — That the said bonus shall be short of the actual surplus profits at the time of making the same, by the sum of 5,000*l.* at least.

That the bonus so declared shall be divided into 3 equal parts.

That one of the said parts shall be added to and consolidated with the subscription capital stock. (This is the proprietors' fund.)

That the remaining 2-3ds be allotted to the policies in the manner described in the deed.

That the sum to which any person assured by the Company may become entitled under any such distribution, shall be paid by the Company without interest, at the time when the sum assured by the policy shall become payable, and not before.

Union. — Those who assure with this Company will participate with the proprietors in the profits of the establishment, which will be added every 7 years to the respective policies.

United Empire. — Persons effecting assurances for the whole continuance of life will, at the end of the first 5 years, and of every subsequent 5 years, be entitled to participate in whatever nett surplus profits it may be declared by the directors expedient to divide.

Two-fifths of the aforesaid profits will be divided amongst the said assured, in proportion to the premiums they may respectively have paid, and will, at their option, be either added to the amount of their policies, or applied in reduction of their future premiums.

University. — As it is intended that the capital advanced shall be repaid to the shareholder, with a bonus of 100*l.* per cent., 1-10th of the profits, when ascertained by a valuation of all existing risks, will every 5 years be applied to form a fund for that purpose.

The remaining 9-10ths of the profits to be divided between the assured and the shareholder, in the proportion of 8 parts to the former and 1 to the latter.

The profit or bonus to the assured to be given either by a diminution of the rate of premium, or by an increase of the amount of policy, at the option of the party.

Westminster. — By a regulation taking effect from the 9th of May, 1832, this Society makes a positive addition of 10 per cent. every 10th year to all sums insured on single lives, for the whole term of life, by policies issued after that date; but it no longer grants any new policies.

In order to hinder the growth of gambling transactions upon life insurance, it was judiciously enacted, by stat. 14 Geo. 3. c. 48., that

No insurance shall be made by any person or persons, bodies politic or corporate, on the life or lives of any person or persons, or any other event or events whatsoever, where the person or persons, for whose use or benefit, or on whose account, such policy or policies shall be made, *shall have no interest*, or by way of gaining or wagering; and that every insurance made contrary to the true intent and meaning of this act, shall be null and void to all intents and purposes whatsoever. — Sect. 1.

It shall not be lawful to make any policy or policies on the life or lives of any person or persons, or other event or events, *without inserting in such policy or policies, the name or names of the person or persons interested therein, or for what use, benefit, or on whose account such policy is so made or underwrote.* — Sect. 2.

In all cases where the insured has an interest in such life or lives, event or events, no greater sum shall be recovered or received from the insurer or insurers, than the amount or value of the interest of the insured in such life or lives, or other event or events. — Sect. 3.

A creditor has an insurable interest in the life of his debtor; but it was decided, in a case which arose out of a policy on the life of the late Mr. Pitt, that if, after the death of a debtor whose life is insured by a creditor, and before any action is brought on the policy, the debt be paid, no action will lie.

All insurance offices either insert in their policies or refer in them to a declaration signed by the insured, setting forth his age, or the age of the party upon whom he is making an insurance; whether he has or has not had the small-pox, gout, &c.; "that he is not afflicted with any disorder that tends to the shortening of life;" that this declaration is to be the basis of the contract between him and the society; and that, if there be any untrue averment in it, all the monies paid to the society upon account of the insurance shall be forfeited to them. — (See Form, *post.*)

The condition as to the party not being afflicted with any disorder that tends to the shortening of life is vague, and has given rise to a good deal of discussion. But it is now settled that this condition is sufficiently complied with, if the insured be in a reasonably good state of health; and although he may be afflicted with some disease, yet if it can be shown that this disease does not tend to shorten life, and was not, in fact, the cause of the party's death, the insurer will not be exonerated: "Such a warranty," said Lord Mansfield, "can never mean, that a man has not in him the seeds of some disorder. We are all born with the seeds of mortality in us. The only question is, whether the insured was in a *reasonably good state of health*, and such a life as ought to be insured on common terms."—(See *Marshall on Insurance*, book iii.; *Park on Insurance*, c. 22.)

Policies of life insurance must be on stamped paper, the duty being as follows: — viz.

When the sum insured shall not exceed 500*l.*, for every 50*l.*, and any fractional part of 50*l.*, 6*d.*

Exceeding 500*l.* and not exceeding 1000*l.*, for every 100*l.* and any fractional part of 100*l.*, 1*s.*

Exceeding 1000*l.*, for every 1000*l.* and any fractional part of 1000*l.*, 10*s.*

We subjoin a statement of the terms and conditions on which the Sun Life Assurance Society transacts business, and a copy of one of its policies upon the life of a person aged 30, insuring his own life for 1000*l*. The conditions of most of the other societies are similar, and may be learned by any one, on applying either at the head offices in town, or at their agents' in the country. The premiums demanded by the principal offices are exhibited in the Table, page 759.

Sun Life.—An assurance for a term of years, or for the whole continuance of life, is a contract on the part of the office to continue the assurance during that term, on the payment of a certain annual premium, but the assured may drop it, whenever the end is answered for which the assurance was made.

The person whose life is proposed for assurance, is required to appear either before the managers at the office in London, or before an agent in the country; in default of which the non-appearance fine must be paid when the assurance is effected; which, when the term is 1 year, is 10*s.* for every 100*l.* assured. When the term exceeds 1 year, but does not exceed 7 years, it is 15*s.* for every 100*l.* And when the term exceeds 7 years, the fine is 1 per cent.

Reference to be made to 2 persons of repute, to ascertain the identity of the person appearing.

Any premium remaining unpaid more than 15 days after the time stipulated in the policy, such policy becomes void; but the defaulter producing satisfactory proof to the managers, of the health of the person on whose life the assurance was made, and paying the said premium within 3 calendar months, together with the additional sum of 10*s.* upon every 100*l.* assured by such policy, then such policy is revived, and continues in force.

Conditions of Assurance made by Persons on their own lives.

The assurance to be void if the person whose life is assured shall depart beyond the limits of Europe; shall die upon the seas except (not being a seafaring person by occupation) in passing during peace from any part of Europe to any other part of Europe; or shall enter into or engage in any military or naval service whatsoever, other than in the militia or in any yeomanry or volunteer corps acting within the United Kingdom of Great Britain and Ireland, without the previous consent of the society; or shall not be, at the time the assurance is made, in good health; or shall die by suicide, duelling, or the hands of justice, so far as respects such person, but shall remain in force so far as any other person or persons shall then have a *bonâ fide* interest therein, acquired three months previously to such decease by assignment, or legal or equitable lien, upon due proof of the value of such interest being made to the satisfaction of the managers, according to the claimant's debt or purchase money, with interest, and premiums paid by him; and if any person assured upon his own life, and who shall have been so for at least five years, shall die by his own hands, and not *felo de se*, the managers shall be at liberty, if they shall think proper, to pay for the benefit of his family, any sum not exceeding what the society would have paid for the purchase of his interest in the policy, if it had been surrendered to the society the day previous to his decease, provided the interest in such assurance shall then be in the assured, or in any trustee or trustees for him, or for his wife, or children.

N. B.—The above conditions apply equally to all policies of the society now in force.

Conditions of Assurance made by Persons on the lives of others.

The party on whose behalf the assurance is made, must be interested in the life of the other to the full amount assured thereon.

The assurance to be void, if the person whose life is assured shall depart beyond the limits of Europe; shall die upon the seas except (not being a seafaring person by occupation) in passing during peace from any part of Europe to any other part of Europe, or shall enter into or engage in any military or naval service whatsoever, other than in the militia or in any yeomanry or volunteer corps acting within the United Kingdom of Great Britain and Ireland without the previous consent of the society; or shall not be, at the time the assurance is made, in good health.

All claims are paid within 3 months after certificates (according to the required forms) of the death and burial of the deceased are approved by the managers.

No assurance can take place until the first payment is made.

Form of a Proposal for Assurance.

Name, and rank or profession, of the life to be assured.
Present residence.
Place of birth.
Date of birth.
Age next birth-day.
Sum.
Term.
Name and addition { of the usual medical attendant of the person whose life is proposed to be assured. / of a friend or acquaintance who knows well his habits of life.
Have you ever had gout or asthma, or any fit or fits?
Have you ever been afflicted with rupture?
Have you ever exhibited any symptom of consumption of the lungs?
Have any of your near relations died of consumption of the lungs, or other pulmonary disease?
Are you afflicted with any disorder tending to shorten life?
Are you afflicted with disease or disorder of any kind?
What is the state of your health generally?
Have you had the small-pox or the cow-pox?
Whether the person whose life is proposed to be assured, intends to appear at the office?
In whose name or behalf the policy is desired?
Date of proposal.
Annual Notices to be sent to

Form of Declaration to be made and signed by or on behalf of a Person who proposes to make an Assurance on the Life of another.

I
now resident at
in the county of being
desirous of assuring with the Sun Life Assurance Society, the sum of £ on the life of
born in the parish of
in the county of on the
day of in the year
and now resident at in the county of
Do declare, that I have an interest in the life of the said to the full amount of the said sum of £ ; that to the best of my knowledge and belief the age of the said does not exceed years; that he has had the * that he had the gout, asthma, rupture, nor any fit or fits, that he is sober and temperate in h habits of life, and that he is not afflicted with any disorder tending to shorten life; and this declaration is to be the basis of the Contract between me and the said Society; and if there be any untrue averment therein, all monies which shall have been paid to the Society upon account of the assurance made in consequence thereof, shall be forfeited. Dated the day of 18 .

* Insert small-pox or cow-pox, as the case may require.

**Policy by the Sun Life Assurance Society for* 1,000*l.*, *on the Life of A.B., aged Thirty, insuring his own Life.*

No.——

SUN LIFE ASSURANCE SOCIETY.

THIS POLICY OF ASSURANCE WITNESSETH, that, whereas A. B., Esq., of —— Square, London, being desirous of making an assurance upon his own life for the whole duration thereof, and having subscribed, or caused to be subscribed, and delivered into this office, a declaration setting forth his ordinary and present state of health, wherein it is declared that the age of the said A. B. did not then exceed 30 years; and having paid to the managers for the Sun Life Assurance Society, at their office, in the city of London, the sum of twenty-four pounds eleven shillings and eight-pence sterling, as a consideration for the assurance of the sum under-mentioned for *one year*, from the twentieth day of January, 1843.

NOW KNOW ALL MEN BY THESE PRESENTS, that in case the said assured shall happen to die at any time within the term of *one year*, as above set forth, the stock and funds of this Society shall be subject and liable to pay and make good to the executors, administrators, or assigns of the said assured, within three months after the demise of the said assured shall have been duly certified to the managers aforesaid, at their said office, the sum of one thousand pounds sterling, of lawful money of Great Britain, with such additions or additions as the managers for the said Society may from time to time make thereto, under the powers vested in them by an Act of Parliament made and passed in the Seventh Year of King William IV. cap. 47.

It is hereby agreed, that this policy may continue in force from *year* to *year*, until the expiration of the term first above-mentioned, provided that the said assured shall duly pay, or cause to be paid, to the managers, at their said office, on or before the nineteenth day of October next ensuing, the sum of twenty-four pounds eleven shillings and eight-pence sterling, and the like sum annually, on or before the day aforesaid; which annual payments shall be accepted, at every such period, as a full consideration for such assurance.

And it is hereby further agreed, that the assurance by this policy shall be extended during peace, to the risk of the above-named A. B., Esq. dying upon the sea in passing between any one part of Europe to any other part of Europe.

PROVIDED NEVERTHELESS, that should the said assured, within the term for which this policy is granted, depart beyond the limits of Europe, die upon the seas (except as above stated), or engage in any military or naval service whatsoever, other than in the militia or in any yeomanry or volunteer corps acting within the United Kingdom of Great Britain and Ireland; or should the assurance have been

obtained through any misrepresentation of the age, state of health, or description of the said assured; or should the said assured die by duelling, suicide, or the hands of justice; then this policy, and every thing appertaining thereto, shall cease, be void, and of none effect, so far as respects the said assured, but in case the said assured die by suicide, duelling, or the hands of justice, this policy shall remain in force so far as any other person or persons shall then have a *bonâ fide* interest therein, acquired three months previously to such decease by assignment, or by legal or equitable lien, upon due proof of the value of such interest being made to the satisfaction of the managers according to the claimant's debt or purchase money, with interest, and premiums paid by him. And if the said assured shall have been so for at least five years, and shall die by own hands, and not *felo de se*, the managers shall be at liberty, if they shall think proper, to pay for the benefit of family, any sum not exceeding what the society would have paid for the purchase of interest in the policy if it had been surrendered to the society the day previous to decease, provided such interest shall then be in the assured, or in any trustee or trustees for .

In WITNESS WHEREOF, we, three of the managers for the said Society, have hereunto set our hands and seals, this day of 18 .

N.B. This Society is in no case bound by notice of any Assignment of this Policy, unless the same be delivered in writing at their Office in Threadneedle-Street, London.

Signed, Sealed, and Delivered,
being first duly Stamped,
in the presence of
Their own Lives.

The following are the premiums demanded by the Sun Life Assurance Society, for insurances on joint lives and survivorships.

Joint Lives.—A Table of Annual Premiums payable during the joint Continuance of Two Lives, for assuring One Hundred Pounds, to be paid as soon as either of the Two shall drop.

From the specimens of premiums in the two preceding Tables, the reader will easily judge of the proportional premiums for any combination of two ages not inserted in them.

Instead of a gross sum payable at the decease of A. provided B. be then living, a reversionary annuity on the remainder of the life of B. after the decease of A. may be insured by the payment of an annual premium during the joint continuance of the two lives; which annual premium may be learnt by application at the office.

TABLE OF PREMIUMS.

The following tabular statement shows the premiums demanded by the principal Life Insurance Societies for insuring 100*l.* at every different age from 15 to 60, for the whole term of life.

Equitable Assurance Society.—The following is the

*Declaration required to be made and signed in the Office, by or on the Behalf of a Person * who proposes to make an Assurance on his or her own Life.*

I

being desirous of becoming a member of the Society for Equitable Assurances on Lives and Survivorships, and intending to make assurance in the Sum of

upon and for the continuance of my own life, and having perused and considered that * clause of the deed of settlement of the said Society which requires a declaration in writing of the age, state of health, and other circumstances attending the person whose life shall be proposed to be assured, do hereby declare and set forth, that my age does not exceed ; that I have had the small-pox ; and have had the gout; and that I am not afflicted with any disorder which tends to the shortening of life; and I do hereby agree that this declaration be the basis of the contract between the said Society and me, and that if any untrue averment is contained in this declaration, all monies which shall have been paid to the Society upon account of the assurance made in consequence thereof, shall be forfeited. Dated the day of in the year of our Lord .

* *The Clause which is referred to in the Declaration.*

That every person desirous of making assurance with the Society, shall sign or execute a declaration in writing (in the presence of one credible witness, who shall attest the same), setting forth the age, state of health, profession, occupation, and other circumstances attending the person or persons whose life or lives shall be proposed to be assured; which declaration shall be the basis of the contract between the said Society and the person desiring to make assurance with them; in which declaration if any artful, false, or fraudulent representation shall be used, and the same shall at any time thereafter be discovered, from thenceforth the sums which shall have been paid to the Society on account of any assurance so fraudulently obtained, shall be forfeited to the use of the Society; and all claims to be made on that behalf shall cease, determine, and be void, to all intents and purposes whatsoever.

Form of a Proposal to be presented to a Weekly Court of Directors.

Name and profession of the life to be assured.
Place and date of birth.
Place of residence.
Age. Sum. Term.
By whom made.
To give reference to two † persons of good repute, (one, if possible, of the medical profession,) to ascertain the present and general state of health of the life to be assured.
If had the small-pox. If vaccinated.
If afflicted with the gout. If ever ruptured.

† Parties who do not appear before the Court of Directors are required to give a reference to 3 persons for an account of the present and general state of their health.

A Table of Annual Premiums payable during the Continuance of Two Joint Lives for assuring One Hundred Pounds, to be paid when either of the Lives shall drop.

An addition of 22 per cent., *computed upon the premium*, is charged upon military persons; and an addition of *eleven per cent.* on officers on half-pay, officers in the militia, fencibles, and the like levies; also on persons not having had the small-pox, or having had the gout.

Persons preferring the payment of a gross sum or single premium upon an assurance for any certain term, are chargeable in a due proportion to the annual premium for such term.

Every person making any assurance with the Society, pays 5*s.* in the name of entrance money; and if the sum assured exceeds 100*l.*, the entrance money is charged after the rate of 5*s.* for every 100*l.* But if the person upon whose life an assurance is proposed, does not appear before the directors, the entrance money is charged after the rate of 1*l.* for every 100*l.*

The following are the premiums demanded by the Equitable Society for insuring 100*l.*, or an equivalent annuity on the contingency of one life's surviving the other: —

Ages.		Premium.	Annuity equivalent to 100*l.* to be paid from the Death of the Life assured, during the Remainder of the other Life.

It is stated by Mr. Morgan, in his Account of the Equitable Society already referred to, that the number of insurances in that institution for terms of years does not much exceed the *one hundredth part* of those for the whole period of life; and that the business of the office at present is almost wholly confined to the assurance of persons on *their own lives*—those on the lives of *others*, whether for terms or for continuance, being, in consequence of the commission money allowed to agents and attorneys, engrossed by the new offices.—(*Account of the Equitable Society*, p. 53.)

INTEREST AND ANNUITIES. Interest is the sum paid by the borrower of a sum of money, or of any sort of valuable produce, to the lender, for its use.

The rate of interest, supposing the security for and facility of re-possessing the principal, or sum lent, to be equal, must obviously depend on what may be made by the employment of capital in industrious undertakings, or on the rate of profit. Where profits are high, as in the United States, interest is also high; and where they are comparatively low, as in Holland and England, interest is proportionally low. In fact, the rate of interest is nothing more than the *nett* profit on capital: whatever returns are obtained by the borrower, beyond the interest he has agreed to pay, really accrue to him on account of risk, trouble, or skill, or of advantages of situation and connection.

But besides fluctuations in the rate of interest caused by the varying productiveness of industry, the rate of interest on each particular loan must, of course, vary according to the supposed solvency of the borrowers, or the degree of risk supposed to be incurred by the lender, of either not recovering payment at all, or not recovering it at the stipulated term. No person of sound mind would lend on the personal security of an individual of doubtful character and solvency, and on mortgage over a valuable estate, at the same rate of interest. Wherever there is risk, it must be compensated to the lender by a higher premium or interest.

And yet, obvious as this principle may appear, all governments have interfered with the adjustment of the terms of loans: some to prohibit interest altogether, and others to fix certain rates which it should be deemed legal to charge, and illegal to exceed. The prejudice against taking interest seems to have principally originated in a mistaken view of some enactments of the Mosaical law—(see *Michaelis on the Laws of Moses*, vol. ii. pp. 327—353. Eng. ed.), and a statement of Aristotle, to the effect that, as money did not produce money, no return could be equitably claimed by the lender! But whatever may have been the origin of this prejudice, it was formerly universal in Christendom; and is still supported by law in all Mohammedan countries. The famous reformer, Calvin, was one of the first who saw and exposed the absurdity of such notions—(see an extract from one of his epistles *in Principles of Political Economy*, by the author of this work, 3d ed. p. 520.); and the abuses caused by the prohibition, and the growing conviction of its impolicy, soon after led to its relaxation. In 1554, a statute was passed authorising lenders to charge 10 per cent. interest. In 1624, the legal rate was reduced to 8 per cent.; and in the reign of Queen Anne it was further reduced to 5 per cent., at which it still continues. It is enacted, by the statute (12 Ann. c. 16.) making this reduction, that "all persons who shall receive, by means of any corrupt bargain, loan, exchange, chevizance, or interest of any wares, merchandise, or other thing whatever, or by any deceitful way or means, or by any covin, engine, or deceitful conveyance for the forbearing or giving day of payment, for one whole year for their money or other thing, above the sum of 5*l.* for 100*l.* for a year, shall forfeit for every such offence, the *treble* value of the monies, or other things, so lent, bargained," &c.

It is needless to waste the reader's time by entering into any lengthened arguments to show the inexpediency and mischievous effect of such interferences. This has been done over and over again. It is plainly in no respect more desirable to limit the rate of interest, than it would be to limit the rate of insurance, or the prices of commodities. And though it were desirable, it cannot be accomplished. The real effect of all legislative enactments having such an object in view, is to increase, not diminish, the rate of interest. When the rate fixed by law is less than the market or customary rate, lenders and borrowers are obliged to resort to circuitous devices to evade the law; and as these devices are always attended with more or less trouble and risk, the rate of interest is proportionally enhanced. During the late war it was not uncommon for a person to be paying 10 or 12 per cent. for a loan, which, had there been no usury laws, he might have got for 6 or 7 per cent. Neither was it by any means uncommon, when the rate fixed by law was more than the market rate, for borrowers to be obliged to pay more than they really stipulated for. It is singular that an enactment which contradicted the most obvious principles, and had been repeatedly condemned by committees of the legislature, should have been allowed to preserve a place in the statute book, for so long a period; but at length it was substantially repealed by the act 2 & 3 Victoria, c. 37., which exempts bills of exchange not having more than 12 months to run, and contracts for loans of money above 10*l.*, from its operation.

Distinction of Simple and Compound Interest.—When a loan is made, it is usual to stipulate that the interest upon it should be regularly paid at the end of every year, half year, &c. A loan of this sort is said to be at simple interest. It is of the essence of such loan, that no part of the interest accruing upon it should be added to the principal to form a new principal; and though payment of the interest were not made when it becomes due, the lender would not be entitled to charge interest upon such unpaid interest. Thus, suppose 100*l.* were lent at simple interest at 5 per cent., payable at the end of each year;

the lender would, at the end of 3 or 4 years, supposing him to have received no previous payments, be entitled to 15*l.* or 20*l.*, and no more.

Sometimes, however, money or capital is invested so that the interest is not paid at the periods when it becomes due, but is progressively added to the principal; so that at every term a new principal is formed, consisting of the original principal, and the successive accumulations of interest upon interest. Money invested in this way is said to be placed at *compound interest*.

It appears not unreasonable, that when a borrower does not pay the interest he has contracted for, at the period when it is due, he should pay interest upon such interest. This, however, is not allowed by the law of England; nor is it allowed to make a loan at compound interest. But this rule is often evaded, by taking a new obligation for the principal with the interest included, when the latter becomes due. Investments at compound interest are also very frequent. Thus, if an individual buy into the funds, and regularly buy fresh stock with the dividends, the capital will increase at compound interest; and so in any similar case.

Calculation of Interest. — Interest is estimated at so much per cent. per annum, or by dividing the principal into 100 equal parts, and specifying how many of these parts are paid yearly for its use. Thus, 5 per cent., or 5 parts out of 100, means that 5*l.* are paid for the use of 100*l.* for a year, 10*l.* for the use of 200*l.*, and 2*l.* 10*s.* for the use of 50*l.* for the same period, and so on.

Suppose, now, that it is required to find the interest of 210*l.* 13*s.* for $3\frac{1}{4}$ years at 4 per cent. simple interest. In this case we must first divide the principal, 210*l.* 13*s.* into 100 parts, 4 of which will be the interest for 1 year; and this being multiplied by $3\frac{1}{4}$ will give the interest for $3\frac{1}{4}$ years. But instead of first dividing by 100, and then multiplying by 4, the result will be the same, and the process more expeditious, if we first multiply by 4, and then divide by 100. Thus,—

£	s.					
210	13	principal				
	4	rate per cent.				
		£	s.	d.		
1,00) 8,12	12 (	8	8	$6\frac{1}{2}$		1 year's interest.
20				3[1]		
8,52		25	5	$6\frac{3}{4}$		3 years' interest.
12		4	4	3		$\frac{1}{4}$ a year's interest.
6,24		£29	9	$9\frac{3}{4}$		$3\frac{1}{4}$ years' interest.
4						
96						

It is almost superfluous to observe, that the same result would have been obtained by multiplying the product of the principal and rate by the number of years, and then dividing by 100.

Hence, to find the interest of any sum at any rate per cent. for a year, multiply the sum by the rate per cent., and divide the product by 100.

To find the interest of any sum for a number of years, multiply its interest for one year by the number of years; or, without calculating its interest for one year, multiply the principal by the rate per cent. and that product by the number of years, and divide the last product by 100.

When the interest of any sum is required for a number of days, they must be treated as fractional parts of a year; that is, we must multiply the interest of a year by them, and divide by 365.

Suppose that it is required to find the interest of 210*l.* for 4 years 7 months and 25 days, at $4\frac{1}{2}$ per cent.—

Principal -	£210	Interest for 4 years	= £37·8000
Rate per cent. -	$4\frac{1}{2}$	6 months = $\frac{1}{2}$ of 1 year	= 4·7250
	840	1 month = $\frac{1}{6}$ of 6 months	= ·7875
	105	25 days	= ·6472
Interest for 1 year	£9·45 × 4 = £37·80 do. for 4 years.		£43·9597 = £43 19*s.* 2$\frac{1}{4}$*d.*

The interest for 25 days is $\frac{9{\cdot}45 \times 25}{365} = {\cdot}6472$; that is, it is equal to the interest for a year multiplied by the fraction $\frac{25}{365}$.

Division by 100 is performed by cutting off two figures to the right.

Many attempts have been made to contrive more expeditious processes than the above for calculating interest. The following is the best: —

Suppose it were required to find the interest upon 172*l.* for 107 days at 5 per cent.

This forms what is called in arithmetical books a double rule of three question, and would be stated as follows: —

£ Days. £ £ Days.
100 × 365 : 5 :: 172 × 107 : 2*l.* 10*s.* 4$\frac{1}{2}$*d.*, the interest required.

Hence, to find the interest of any sum for any number of days at any rate per cent., multiply the sum by the number of days, and the product by the rate, and divide by 36,500 (365×100); the quotient is the interest required.

When the rate is 5 per cent., or 1-20th of the principal, all that is required is to divide the product of the sum multiplied by the days by 7,300 (365, the days in a year, multiplied by 20).

Five per cent. interest being found by this extremely simple process, it is usual in practice to calculate 4 per cent. interest by deducting 1-5th; 3 per cent. by deducting 2-5ths; $2\frac{1}{2}$ per cent. by dividing by 2; 2 per cent. by taking the half of 4, and so on.

In calculating interest upon accounts current, it is requisite to state the number of days between each receipt, or payment, and the date (commonly the 31st of December) to which the account current is made up. Thus, 172*l.* paid on the 15th of September, bearing interest to the 31st of December, 107 days. The amount of such interest may, then, be calculated as now explained, or by the aid of Tables. The reader will find, in the article BOOKKEEPING (p. 155.) an example of interest on an account current computed as above, without referring to Tables.

The 30th of June is, after the 31st of December, the most usual date to which accounts current are made up, and interest calculated. In West India houses, the 30th of April is the common date, because at that season the old crop of produce is generally sold off, and the new begins to arrive.

It is of great importance, in calculating interest on accounts current, to be able readily to find the number of days from any day in any one month to any day in any other month. This may be done with the utmost ease by means of the annexed Table. (See next page.)

By this Table may be readily ascertained the number of days from any given day in the year to another. For instance, from the 1st of January to the 14th of August (first and last days included), there are 226 days. To find the number, look down the column headed January, to Number 14, and then look along in a parallel line to the column headed August, you find 226, the number required.

To find the number of days between any other two given days, when they are both after the 1st of January, the number opposite the 1st day must, of course, be deducted from that opposite to the second. Thus, to find the number of days between the 13th of March and the 19th of August, deduct from 231, the number in the Table opposite to 19 and under August, 72, the number opposite to 13 and under March, and the remainder, 159, is the number required, last day included.

In leap years, *one* must be added to the number after the 28th of February.

For the mode of calculating discount, or of finding the present values of sums due at some future date, at simple interest, see DISCOUNT.

In counting-houses, Interest Tables are very frequently made use of. Such publications have, in consequence, become very numerous. Most of them have some peculiar recommendation; and are selected according to the object in view.

When interest, instead of being simple, is compound, the first year's or term's interest must be found

and being added to the original principal, makes the principal upon which interest is to be calculated for the second year or term; and the second year's or term's interest being added to this last principal, makes that upon which interest is to be calculated for the third year or term; and so on for any number of years.

But when the number of years is considerable, this process becomes exceedingly cumbersome and tedious, and to facilitate it Tables have been constructed, which are subjoined to this article.

The first of these tables (No. I.) represents the amount of 1*l.* accumulating at compound interest, at 3, 3½, 4, 4½, and 5 per cent. every year, from 1 year to 70 years, in pounds and decimals of a pound. Now, suppose that we wish to know how much 500*l.* will amount to in 7 years at 4 per cent. In the column marked 4 per cent. and opposite to 7 years, we find 1·315,932*l.*, which shows that 1*l.* will, if invested at 4 per cent. compound interest amount to 1·315,932 in 7 years; and consequently, 500*l.* will, in the same time, and at the same rate, amount to 500 × 1·315,932*l.* or 657·966*l.*; that is 657*l.* 19*s.* 4*d.*

For the same purpose of facilitating calculation, the present value of 1*l.* due any number of years hence, not exceeding 70, at 3, 3½, 4, 4½, and 5 per cent. compound interest, is given in the subjoined Table, No. II. The use of this Table is precisely similar to the one below. Let it, for example, be required to find the present worth of 560*l.* due 7 years hence, reckoning compound interest at 4 per cent. Opposite to 7 years, and under 4 per cent., we find ·75291,781*l.*, the present worth of 1*l.* due at the end of 7 years; and multiplying this sum by 500*l.*, the product, being 379·9589*l.*, or 379*l.* 19*s.* 2*d.*, is the answer required.

Table for ascertaining the Number of Days from any one Day in the Year to any other Day.

Annuities.

1. *Annuities certain.* — When a sum of money is to be paid yearly for a certain number of years, it is called an annuity. The annuities usually met with are either for a given number of years, which are called *annuities certain*; or they are to be paid so long as one or more individuals shall live, and are thence called *contingent annuities.*

By the amount of an annuity at any given time, is meant the sum to which it will then amount, supposing it to have been regularly improved at compound interest during the intervening period.

The present value of an annuity for any given period, is the sum of the present values of all the payments of that annuity.

Numbers III. and IV. of the subjoined Tables represent the amount and present value of an annuity of 1*l.* reckoning compound interest at 2½, 3, 3½, 4, 4½, 5, and 6 per cent. from 1 year to 70. They, as well as Nos. I. and II., are taken from "Tables of Interest, Discount, and Annuities, by John Smart, Gent. 4to. London, 1726." They are carried to 8 decimal places, and enjoy the highest character, both here and on the Continent, for accuracy and completeness. The original work is now become very scarce.

The uses of these Tables are numerous; and they are easily applied. Suppose, for example, it were required to tell the amount of an annuity of 50*l.* a year for 17 years at 4 per cent. compound interest.

Opposite to 17 (Table III.) in the column of years, and under 4 per cent., is 23·69751,239, being the amount of an annuity of 1*l.* for the given time at the given rate per cent.; and this multiplied by 50 gives 1184 8756195, or 1,184*l.* 17*s.* 6*d.*, the amount required.

Suppose, now, that it is required what sum one must pay down to receive an annuity of 50*l.* to continue for 17 years, compound interest at 4 per cent.?

Opposite to 17 years (Table IV.) and under 4 per cent. is 12·16566,886, the present value of an annuity of 1*l.* for the given time and at the given rate per cent.; and this multiplied by 50 gives 608·283443, or 608*l.* 5*s.* 8*d.*, the present value required.

When it is required to find the *time* which must elapse, in order that a given sum improved at a specified rate of compound interest may increase to some other given sum, divide the latter sum by the former, and look for the quotient, or the number nearest to it, in Table No. I. under the given rate per cent., and the years opposite to it are the answer. — Thus,

In what time will 523*l.* amount to 1,087*l.* 5*s.* 7*d.* at 5 per cent. compound interest?

Divide 1087·2794, &c. by 523, and the quotient will be 2·0789, &c., which under 5 per cent. in Table I. is opposite to 15 years, the time required.

If it had been required to find the time in which a given annuity, improved at a certain rate of compound interest, would have increased to some given sum, the question would have been answered by dividing, as above, the given sum by the annuity; and looking for the quotient (not in Table No. I., but) in Table No. III., under the given rate per cent., it would be found on a line with the time required. Thus,

A. owes 1,000*l.* and resolves to appropriate 10*l.* a year of his income to its discharge: in what time will the debt be extinguished, reckoning compound interest at 4 per cent.?

1,000 divided by 10 gives 100, the number in Table No. III. under 4 per cent., and nearest to this quotient is 99·8265, &c. opposite to 41 years, the required time. Had the rate of interest been 5 per cent., the debt would have been discharged in somewhat less than 37 years. This example is given by Dr. Price (*Annuities*, 6th ed. vol. ii. p. 289.); and on this principle the whole fabric of the sinking fund was constructed. Of the abstract truth of the principle there cannot, indeed, be a doubt. But every thing depends on the increasing sums annually produced being immediately invested on the same terms; and this, when the sum is large, and the period long, is altogether impracticable.

Let it next be required to find an annuity which, being increased at a given rate of compound interest during a given time, will amount to a specified sum: in this case we divide the specified sum by the amount of 1*l.* for the time and rate given, as found in Table III., and the quotient is the answer. — Thus,

What annuity will amount to 1,087*l.* 5*s.* 7*d.* in 15 years at 5 per cent. compound interest?

Opposite to 15 years in Table III., and under 5 per cent., is 21·5785, &c., the amount of 1*l.* for the given time and rate; and dividing 1087·2794, &c. by this sum, the quotient 50·387, &c., or 50*l.* 7*s.* 9*d.*, is the annuity required.

Deferred Annuities are those which do not commence till after a certain number of years; and *reversionary annuities*, such as depend upon the occurrence of some uncertain event, as the death of an individual, &c.

The present value of a deferred annuity is found by deducting, from the value of an annuity for the whole period, the value of an annuity to the term at which the reversionary annuity is to commence. — Thus,

What is the present value of an annuity of 50*l.* to continue for 25 years, commencing at 7 years from the present time, interest at 4 per cent.?

According to Table No. IV., the value of an annuity of 1*l.* for 25 years at 4 per cent. is 15·62207,995, and that of 1*l.* for 7 years is 6·00205,467, which being deducted from the other, leaves 9·62002,528, which multiplied by 50 gives 481*l.*, the answer required.

Supposing the annuity, instead of being for 25 years, had been a perpetuity, it would have been worth 1,250*l.*, from which deducting 300*l.* 2*s.*, the value of an annuity for 7 years at 4 per cent., there remains 949*l.* 18*s.*, the value of the reversion.

For a selection of problems that may be solved by Tables of annuities certain, see *Smart's Tables*, pp. 92—100.

2. *Life Annuities.* — After what has been stated in the article on INSURANCE (GENERAL PRINCIPLES OF), respecting Tables of mortality, it will be easy to see how the value of a life annuity is calculated. Supposing — to revert to the example given before (p. 739.) — that it were required to find the present value of 1*l.*, the receipt of which is dependent on the contingency of a person, now 56 years of age, being alive 10 years hence, taking the Carlisle Table of mortality, and interest at 4 per cent.: Now, according to that Table, of 10,000 persons born together, 4,000 attain to 56, and 2,894 to 66 years of age. The probability that a person, now 56 years, will be alive 10 years hence, is, consequently, $\frac{2,894}{4,000}$; and the present value of 1*l.*, to be received certain 10 years hence being 0·675564*l.*, it follows, that if its receipt be made to depend on a life 56 years of age, attaining to 66, its value will be reduced by that contingency to $\frac{2,894 \times 0{\cdot}675564l.}{4,000} = 0{\cdot}48877l.$, or 9*s.* 9¼*d.* If, then, we had to find the present value of an annuity of 1*l.* secured on the life of a person now 56, we should calculate in this way the present value of each of the 48 payments, which, according to the Carlisle Table, he might receive, and their sum would, of course, be the present value of the annuity.

This statement is enough to show the principle on which all calculations of annuities depend; and this also was, in fact, the method according to which they were calculated, till Mr. Simpson and M. Euler invented a shorter and easier process, deriving from the value of an annuity at any age, that of an annuity at the next younger age. There is a considerable discrepancy in the sums at which different authors, and different insurance offices, estimate the present value of life annuities payable to persons of the same age. This does not arise from any difference in the mode of calculating the annuities, but from differences in the Tables of mortality employed. These can only be accurate when they are deduced from multiplied and careful observations made, during a long series of years, on a large body of persons; or when the average numbers of the whole population, and of the deaths at every age, for a lengthened period, have been determined with the necessary care. It is to be regretted, that governments, who alone have the means of ascertaining the rate of mortality by observations made on a sufficiently large scale, have been singularly inattentive to their duty in this respect. And until a very few years since, when Mr. Finlaison was employed to calculate Tables of the value of annuities from the ages of the nominees in public tontines, and of individuals on whose lives government had granted annuities, all that had been done in this country to lay a solid foundation on which to construct the vast fabric of life insurance had been the work of a few private persons, who had, of course, but a limited number of observations to work upon.

The celebrated mathematician, Dr. Halley, was the first who calculated a Table of mortality, which he deduced from observations made at Breslaw, in Silesia. In 1724, M. De Moivre published the first edition of his tract on *Annuities on Lives*. In order to facilitate the calculation of their values, M. De Moivre assumed the annual decrements of life to be equal; that is, he supposed that out of 86 (the utmost limit of life on his hypothesis) persons born together, one would die every year till the whole were extinct. This assumption agreed pretty well with the true values between 30 and 70

years of age, as given in Dr. Halley's Table; but was very remote from the truth in the earlier and later periods. Mr. Thomas Simpson, in his work on *Annuities and Reversions*, originally published in 1742, gave a Table of mortality deduced from the London bills, and Tables founded upon it of the values of annuities. But at the period when this Table was calculated, the mortality in London was so much higher than in the rest of the country, that the values of the annuities given in it were far too small for general use. In 1746, M. Deparcieux published, in his *Essai sur les Probabilités de la Durée de la Vie Humaine*—a work distinguished by its perspicuity and neatness—Tables of mortality deduced from observations made on the mortuary registers of several religious houses, and on lists of the nominees in several tontines. In this work, separate Tables were first constructed for males and females, and the greater longevity of the latter rendered apparent. M. Deparcieux's Tables were a very great acquisition to the science; and are decidedly superior to some that are still extensively used. Dr. Price's famous work on *Annuities*, the first edition of which was published in 1770, contributed powerfully to direct the public attention to inquiries of this sort; and was, in this respect, of very great utility. Of the more recent works, the best are those of Mr. Baily and Mr. Milne, which, indeed, are both excellent. The latter, besides all that was previously known as to the history, theory, or practice of the science, contains much new and valuable matter; and to it we beg to refer such of our readers as wish to enter fully into the subject.

The Table on which Dr. Price laid the greatest stress, was calculated from the burial registers kept in the parish of All Saints in Northampton, containing little more than half the population of the town. There can be no doubt, however, as well from original defects in the construction of the Table, as from the improvement that has since taken place in the healthiness of the public, that the mortality represented in the Northampton Table is, and has long been, decidedly above the average rate of mortality in England. Mr. Morgan, indeed, the late learned actuary of the Equitable Society, contended that this is not the case, and that the Society's experience shows that the Northampton Table is still remarkably accurate. But the facts Mr. Morgan disclosed in his *View of the Rise and Progress of the Equitable Society* (p. 42.), published in 1828, are quite at variance with this opinion: for he there states, that the deaths of persons insured in the Equitable Society, from 50 to 60 years of age, during the 12 years previously to 1828, were 339; whereas, according to the Northampton Table, they should have been 545! And Mr. Milne has endeavoured to show (Art. *Annuities*, new ed. of *Ency. Brit.*) that the discrepancy is really much greater.

The only other Table used to any extent in England for the calculation of life annuities, is that framed by Mr. Milne from observations made by Dr. Heysham on the rate of mortality at Carlisle. It gives a decidedly lower rate of mortality than the Northampton Table; and there are good grounds for thinking that the mortality which it represents is not very different from the actual rate throughout most parts of England; though it cannot be supposed that a Table founded on so narrow a basis should give a perfectly fair view of the average mortality of the entire kingdom.

In life insurance, the first annual premium is always paid at the commencement of the assurance, and the others at the termination of each year so long as the party assured survives. Hence, at the beginning of the assurance, the whole of the annual premiums payable for it exceed the value of an equal annuity on the life by one year's purchase. And, therefore, when the value of an assurance in present money is given, to find the equivalent annual premium during the life, the whole present value must be divided by the number of years' purchase an annuity on the life is worth, increased by 1. Thus, for an assurance of 100*l.* on a life 40 years of age, an office, calculating by the Carlisle Table of mortality, and at 4 per cent. interest, requires 53·446*l.* in present money. Now, according to that Table and rate of interest, an annuity on a life just 40 years of age is worth 15·074 years' purchase, so that the equivalent annual premium is $\frac{53 \cdot 446l.}{15 \cdot 074 + 1} = 3 \cdot 325l.$, or 3*l.* 6*s.* 8*d.* The annual premium may, however, be derived directly from the value of an annuity on the life, without first calculating the total present value of the assurance. —(See Mr. Milne's *Treatise on Annuities*, or the art. *Annuities* in the new edition of the *Ency. Britannica.*)

In order to exhibit the foundations on which Tables of life annuities and insurance have been founded in this and other countries, we have given, in No. V. of the following Tables, the rate of mortality that has been observed to take place among 1,000 children born together, or the numbers alive at the end of each year, till the whole become extinct, in England, France, Sweden, &c., according to the most celebrated authorities.* The rate of mortality at Carlisle, represented in this Table, is less than that observed any

* The greater part of this Table was originally published by Dr. Hutton in his *Mathematical Dictionary*, art. *Life Annuities*. Mr. Baily inserted it with additions in his work on *Annuities*; and it was published, with the column for Carlisle added, in the *Report of the Committee of the House of Commons on Friendly Societies*.

where else: the rates which approach nearest to it are those deduced from the observations already referred to, of M. Deparcieux, and those of M. Kersseboom, on the nominees of life annuities in Holland.

In order to calculate from this Table the chance which a person of any given age has of attaining to any higher age, we have only to divide the number of persons alive at such higher age, given in that column of the Table selected to decide the question, by the number of persons alive at the given age, and the fraction resulting is the chance.

We have added, by way of supplement to this Table, Mr. Finlaison's Table (No. VI.) of the rate of mortality among 1,000 children born together, according to the decrement of life observed to take place among the nominees in government tontines and life annuities in this country, distinguishing males from females. The rate of mortality which this Table exhibits is decidedly less than that given in the Carlisle Table; but the lives in the latter are the average of the population, while those in the former are all picked. The nominees in tontines are uniformly chosen among the healthiest individuals; and none but those who consider their lives as good ever buy an annuity. Still, however, the Table is very curious; and it sets the superiority of female life in a very striking point of view.

Tables VII. and VIII. give the *expectation of life*, according to the mortality observed at Northampton and Carlisle; the former by Dr. Price, and the latter by Mr. Milne.

The next Table, No. IX., extracted from the *Second Report of the Committee of the House of Commons on Friendly Societies*, gives a comparative view of the results of some of the most celebrated Tables of mortality, in relation to the rate of mortality, the expectation of life, the value of an annuity, &c. The coincidence between the results deduced from M. Deparcieux's Table, and that for Carlisle, is very striking. And to render the information on these subjects laid before the reader as complete as the nature of this work will admit, we have given Tables (Nos. X.—XV.) of the value of an annuity of 1*l.* on a single life, at every age, and at 3, 4, 5, 6, 7, and 8 per cent., according to the Northampton and Carlisle Tables; we have also given Tables of the value of an annuity of 1*l.* on 2 equal lives, and 2 lives differing by 5 years, at 3, 4, 5, and 6 per cent., according to the same Tables. It is but seldom, therefore, that our readers will require to resort to any other work for the means of solving the questions that usually occur in practice with regard to annuities; and there are not many works in which they will find so good a collection of Tables. —We subjoin one or two examples of the mode of using the Tables of life annuities.

Suppose it were required, what ought a person, aged 45, to give, to secure an annuity of 50*l.* a year for life, interest at 4 per cent., according to the Carlisle Table?

In Table No. XI., under 4 per cent., and opposite 45, is 14·104, the value of an annuity of 1*l.*, which being multiplied by 50, gives 705·2, or 705*l.* 4*s.*, the value required. According to the Northampton Table, the annuity would only have been worth 614*l.* 3*s.*

The value of an annuity on 2 lives of the same age, or on 2 lives differing by 5 years, may be found in precisely the same way.

Some questions in *reversionary* life annuities admit of an equally easy solution. Thus, suppose it is required to find the present value of A.'s interest in an estate worth 100*l.* a year, falling to him at the death of B., aged 40, interest 4 per cent. according to the Carlisle Table?

The value of the perpetuity of 100*l.* a year, interest 4 per cent., is 2,500*l.*; and the value of an annuity of 100*l.* on a person aged 40, interest at 4 per cent., is 1,507*l.* 8*s.*, which deducted from 2,500*l.* leaves 992*l.* 12*s.*, the present value required.

A person, aged 30, wishes to purchase an annuity of 50*l.* for his wife, aged 25, provided she survive him; what ought he to pay for it, interest at 4 per cent. according to the Carlisle Table?

The value of an annuity of 1*l.* on a life aged 30 is 16·852*l.*; from which subtracting the value of an annuity of 1*l.* on 2 joint lives of 25 and 30, 14·339, the difference, 2·513 × 50 = 125·650, or 125*l.* 13*s.*, the sum required.

For the solution of the more complex cases of survivorship, which do not often occur in practice, recourse may be had to the directions in Mr. Milne's *Treatise on Annuities*, and other works of that description. To attempt explaining them here would lead us into details quite inconsistent with the objects of this work.

TABLES OF INTEREST AND ANNUITIES.

I. Table showing the AMOUNT of £1 improved at Compound Interest, at 2½, 3, 3½, 4, 4½, 5, and 6 per Cent., at the End of every Year, from 1 to 70.

Years.	2½ per Cent.	3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

IV. Table showing the PRESENT VALUE OF AN ANNUITY of 1*l.* per Annum, to continue for any given Number of Years, from 1 to 70, reckoning Compound Interest at 2½, 3, 3½, 4, 4½, 5, and 6 per Cent

Years.	2½ per Cent.	3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

IX. Table giving a COMPARATIVE VIEW of the Results of the undermentioned Tables of Mortality, in relation to the following Particulars.

	By Dr. Price's Table, founded on the Register of Births and Burials at Northampton.	By the First Swedish Tables, as published by Dr. Price; for both Sexes.	By Mr. Deparcieux's Table, founded on the Mortality in the French Tontines, prior to 1745.	By Mr. Milne's Table, founded on the Mortality observed at Carlisle.	By Mr. Griffith Davies's Table, founded on the Experience of the Equitable Life Insurance Office.	By Mr. Finlaison's Table, founded on the Experience of the Government Life Annuities.	
						According to his *First* Investigation, as mentioned in his Evidence in 1825.	According to his *Second* Investigation, as mentioned in his Evidence in 1827.
						Mean of both Sexes.	*Mean of both Sexes.*
Of 100,000 persons aged 25 there would be alive at the age of 65 - -	34,286	43,137	51,033	51,335	49,330	53,470	53,950
Of 100,000 persons aged 65, there would be alive at the age of 80 - -	28,738	23,704	29,837	31,577	37,267	38,655	37,355
Expectation of life at the age of 25 - years	30·85	34·58	37·17	37·86	37·45	38·35	38·52
Expectation of life at the age of 65 - years	10·88	10·10	11·25	11·79	12·35	12·81	12·50
Value of an annuity on a life aged 25, interest being at 4 per cent. -	£15·438	£16·839	£17·420	£17·645	£17·494	£17·534	£17·634
Value of an annuity on a life aged 65, interest being at 4 per cent. -	£7·761	£7·328	£8·039	£8·307	£8·635	£8·896	£8·751
Value of a deferred annuity commencing at 65, to a life now aged 25, interest at 4 per cent. -	£0·55424	£0·65842	£0·85452	£0·88823	£0·88723	£0·99078	£0·98334

Note.—In all the Tables above mentioned, it is to be observed that the mortality is deduced from an equal, or nearly equal, number of each sex; with the single exception of Mr. Davies's Table, founded on the experience of the Equitable, in which office, from the practical objects of life insurance, it is evident the male sex must have composed the vast majority of lives subjected to mortality. But as it is agreed on all hands that the duration of life among females exceeds that of males, it follows that the results of Mr. Davies's Table fall materially short of what they would have been, if the facts on which he has reasoned had comprehended an equal number of each sex. The Tables have not, in all cases, been computed at 4½ per cent., the rate allowed by government.

The Northampton Table (No. VII.), by under-rating the duration of life, was a very advantageous guide for the insurance offices to go by in insuring lives; but to whatever extent it might be beneficial to them in this respect, it became equally injurious when they adopted it as a guide in selling annuities. And yet, singular as it may seem, some of the insurance offices granted annuities on the *same* terms that they insured lives; not perceiving that, if they gained by the latter transaction, they must obviously lose by the former. Government also continued for a lengthened period to sell annuities according to the Northampton Tables, and without making any distinction between male and female lives! A glance at the Tables of M. Deparcieux ought to have satisfied them that they were proceeding on entirely false principles. But, in despite even of the admonitions of some of the most skilful mathematicians, this system was persevered in till within these few years! We understand that the loss thence arising to the public may be moderately estimated at 2,000,000*l.* sterling. Nor will this appear a large sum to those who recollect that, supposing interest to be 4 per cent., there is a difference of no less than 91*l.* 1*s.* in the value of an annuity of 50*l.* for life, to a person aged 45, between the Northampton and Carlisle Tables.

INVOICE, an account of goods or merchandise sent by merchants to their correspondents at home or abroad, in which the peculiar marks of each package, with other particulars, are set forth. — (See example, *antè*, p. 157.)

IONIAN ISLANDS, the name given to the islands of Corfu, Paxo, Santa Maura, Ithaca, Cephalonia, Zante, Cerigo, and their dependent islets. With the exception of Cerigo, which lies opposite to the south-eastern extremity of the Morea, the rest lie pretty contiguous, along the western coasts of Epirus and Greece; the most northerly point of Corfu being in lat. 39° 48′ 15″ N., and the most southerly point of Zante (Cape Kieri, on which there is a light-house) being in lat. 37° 38′ 35″ N. Kapsali, the port of Cerigo, is in lat. 36° 7′ 30″ N., lon. 23° E.

The area and population of the different islands may be estimated as follows: —

Islands.	Area in Square Miles 15 to a degree.	Population in 1852.
Corfu	10·76	79,581
Cephalonia	16·20	70,870
Zante	5·60	41,992
Santa Maura	4·25	18,966
Ithaca and Calamos	3·32	11,264
Cerigo and Cerigotto	4·50	12,836
Paxo and Antipaxo	1·90	5,111
Totals	47·12*	240,620

* This is equal to 1001·3 English square miles of 69·15 to the degree.

Soil and Climate. — These are very various — Zante is the most fruitful. It consists principally of an extensive plain, occupied by plantations of currants, and having an air of luxuriant fertility and richness. Its climate is comparatively equal and fine, but it is very subject to earthquakes. Corfu and Cephalonia are more rugged and less fruitful than Zante; and the former from its vicinity to the snowy mountains of Epirus, and the latter from the Black Mountain (the Mount Ænos of antiquity) in its interior, are exposed in winter to great and sudden variations of temperature; the frost sometimes damaging to a great extent the oranges and vines of these islands and those of Santa Maura. The latter is, in the hot season, exceedingly unhealthy, — a consequence of the vapours arising from the marshes and the shallow seas to the N. E. Cerigo is rocky and sterile; it is subject to continued gales, and the currents seldom permit its waters to remain unruffled.

History, Government, &c. — These islands have undergone many vicissitudes. Corfu, the ancient Corcyra, was famous in antiquity for its naval power, and for the contest between it and its mother state Corinth, which eventually terminated in the Peloponnesian war. Ithaca, the kingdom of Ulysses; Cephalonia, sometimes called Dulichium, from the name of one of its cities; Zante, or Zacynthus; Santa Maura, known to the ancients by the names of Leucas or Leucadia, celebrated for its promontory, surmounted by a temple of Apollo, whence Sappho precipitated herself into the ocean; and Cerigo, or Cythera, the birth-place of Helen, and sacred to Venus; — have all acquired an immortality of renown. But, on comparing their present with their former state, we may well exclaim, —

Heu quantum hæc Niobe, Niobe distabat ab illâ!

After innumerable revolutions, they fell, about 360 years ago, under the dominion of Venice. Since the downfall of that republic, they have had several protectors, or rather masters, being successively under the dominion of the Russians, the French, and the English. By the treaty of Paris, in 1815, they were formed into a sort of semi-independent state. They enjoy an internal government of their own, under the protection of Great Britain; a Lord High Commissioner, appointed by the queen of England, having charge of the foreign relations, and of the internal, maritime, and sanitary police. Her Majesty's commander-in-chief has the custody of the fortresses, and the disposal of the forces. It is stipulated in the treaty of Paris, that the islands may be called upon for the pay and subsistence of 3,000 men, as well as for the repair of their fortresses occupied by the British troops. The executive government is vested in a president nominated by the commissioner, and a senate of 5 members, (1 for each of the larger islands of Corfu, Cephalonia, Zante, and Santa Maura, and 1 representing collectively the smaller ones of Ithaca, Cerigo, and Paxo, by each of which he is elected in rotation). The senators are elected at the commencement of every quinquennial parliament (subject to a negative from the commissioner) from a legislative chamber of 40 members, themselves elected by the constituencies of the different islands, for 5 years. The senate and legislative assembly, together with the commissioner, are thus the supreme authority: they are, when united, termed the Parliament, and, as such, pass, amend, and repeal laws, in the mode prescribed by the constitution of 1817. Besides the general government, there is in each island a local administration, composed of a regent, named by the senate, and from 2 to 5 municipal officers elected by their fellow citizens.

The State of Society in these islands is far from being good, and was formerly the most depraved imaginable. The people, when they were placed under the ægis of England, were at once lazy, ignorant, superstitious, cowardly, and bloodthirsty. Their vices may, we believe, be, in great degree ascribed to the government and religion established amongst them. The latter consisted of little more than a series of fasts and puerile observances; while the former was both weak and corrupt. The Venetians appointed to situations of power and emolument belonged mostly to noble and decayed families, and looked upon their offices merely as means by which they might repair their shattered fortunes. Hence the grossest corruption pervaded every department. There was no crime for which impunity might not be purchased. Justice, in fact, was openly bought and sold; and suits were decided, not according to the principles of law or equity, but by the irresistible influence of faction or of gold. In consequence, the islands became a prey to all the vices that afflict and degrade a corrupt and semi-barbarous society. Saudys, one of the best English travellers who ever visited the Levant, having touched at Zante in 1610, expresses himself with respect to the inhabitants as follows:—"In habite they imitate the Italians, but transcend them in

their revenges, and infinitely less civil. They will threaten to kill a merchant that will not buy their commodities; and make more conscience to breake a fast than commit a murther. He is weary of his life that hath a difference with any of them, and will walke abroad after daylight. But cowardice is joined with their crueltie, who dare doe nothing but sodainly upon advantage; and are ever privately armed. They are encouraged to villainies by the remissnesse of their laws. The labourers do go into the fields with swords and partizans, as if in an enemie's countrey; bringing home their oils and wines in hogskins, the inside turned out."—(p. 7. ed. 1637.)

If the Zantiotes did not deteriorate during the next 2 centuries, which, indeed, was hardly possible, they certainly did not improve. Dr. Holland, by whom they were visited in 1812, tells us that he heard, "on sure authority, that the number of assassinations in Zante has been more than 1 for each day of the year, though the population was only 40,000!"—(*Travels in the Ionian Isles, &c.* 4to ed. p. 23.)

Matters were, if not quite so bad, very little better in the other islands. In Cephalonia, the inhabitants were divided into factions, entertaining the most implacable animosities, and waging a war of extermination against each other. A little vigour on the part of their rulers would have served to suppress their murderous contests. But this was not an object they wished to attain: on the contrary, their selfish and crooked policy made them seek to strengthen their own power by fomenting the dissensions that prevailed amongst their subjects.—(*Bellin, Description du Golfe de Venise*, p. 165.) Considering the state of society at home, we need not wonder that the Cephalonians, who were distinguished among the islanders for activity and enterprise, were much addicted to emigration. The Venetians attempted to check its prevalence; but, as they neglected the only means by which it could be prevented,—the establishment of security and good order at home,—their efforts were wholly unsuccessful.

The islanders did not, however, satisfy themselves with attempting to stab and prey upon each other. They were much addicted to piracy, particularly the inhabitants of Santa Maura and Cerigo; and it has been alleged that the Venetian government participated in the profits of this public robbery, which, at all events, they took little pains to suppress.

A long series of years will be required to eradicate vices so deeply rooted, and to effect that thorough change in the habits and morals of the people that is so indispensable. The power and influence of the British government has already, however, had a very decided effect. Piracy has been suppressed; and assassination, though still bursting forth, especially in periods of political excitement, with renewed violence, is, speaking generally, a good deal less prevalent. A spirit of industry, sincerity, and fair dealing is beginning to manifest itself. The present generation of nobles possess a degree of information, and a knowledge of the true interests of their country; which, though not all that might be wished for, was, at least, unknown to their fathers. But there is, notwithstanding, a vast deal of intrigue and faction, which is kept alive and fostered by the contentions in their mock parliament. It is not easy to exaggerate the difficulties with which the successive British governors, from Sir Thomas Maitland down to Sir Henry Ward, have had to contend. They have been opposed by every means that feudal rancour, corruption, and pseudo-patriotism could throw in their way. Not that we mean to say they have always acted discreetly, or that the public expenditure has been as judicious and economical as it might have been. But they have, at all events, acted openly and in a straightforward manner; and with an earnest desire to maintain the public tranquillity, and to promote the prosperity of the commonwealth. And it may be hoped that the influence of our example, of the unbiassed execution of the law, and of the education now so generally diffused, may in the end accomplish the regeneration of the islanders.

Manufactures, &c.—These islands possess few manufactures properly so termed. The wives of the villani, or peasants, spin and weave a coarse kind of woollen cloth, sufficient in great part for the use of their families. A little soap is made at Corfu and Zante. The latter manufactures a considerable quantity of silk gros-de-Naples and handkerchiefs; the art of dyeing is, however, too little studied, and the establishments are on too small a scale. The peasantry, in general, are lazy, vain, delighting in display, and very superstitious. Those of Zante and Cephalonia are more industrious than the Corfiotes; in the first, particularly, their superior condition is probably to be ascribed, in part at least, to the nobles residing more on their estates in the country, and contributing, by their example, to stimulate industry. In Corfu, the taste for the city life, which prevailed in the time of the Venetian government, still operates to a great degree. The Corfiote proprietor resides but little in his villa; his land is neglected, while he continues in the practice of his forefathers, who preferred watching opportunities at the seat of a corrupt government, to improving their fortunes by the more legitimate means of honourable exertion and attention to their patrimony. In this respect, however, a material change for the better has taken place during the last 20 years.

Imports of Grain, &c.—Great part of the land is held under short tenures, on the *metayer system*, the tenant paying half the produce to the landlord. Owing to the nature of the soil, and the superior attention given to the culture of olives and currants, the staple products of the islands, most part of the grain and cattle required for their consumption is imported. The hard wheat of Odessa is preferred, and large sums are annually sent to the Black Sea in payment. The parliament, in March, 1833, repealed the duties on the introduction of corn; and the grain monopoly of Corfu, which had been established in favour of government, in order to provide against the possibility of a general or partial scarcity, was then also suffered to expire. These 2 sources of revenue, while they existed, did not probably produce less than 20,000*l.* annually.

Cattle.—They are similarly dependent upon Greece and Turkey for supplies of butcher's meat; a small number only of sheep and goats being bred in the islands. Oxen, whether for agriculture or the slaughter-house, are principally brought from Turkey. The beeves eaten by the troops are 6 weeks or 2 months walking down from the Danube, and the provinces that skirt it, to the shores of Epirus, where they remain in pasture until fit for the table.

Exports.—The staple exports from these islands are oil, currants, wine, soap, salt, and valonia. The first is produced in great abundance in Corfu and Paxo, and in a less quantity in Zante, Santa Maura, and Cephalonia. Corfu has, in fact, the appearance of a continuous olive wood; a consequence, partly, of the extraordinary encouragement formerly given to the culture of the plant by the Venetians. Although there is a harvest every year, the great crop is properly biennial; the tree generally reposing for a year after its effort. (In France and Piedmont the period of inactivity is of 2 and 3 years.) During 5 or 6 months, from October till April, the country, particularly in Corfu, presents an animated appearance, persons of all ages being busily employed in picking up the fruit. The average price may be about 1*l.* 11*s.* per barrel. Under the old Venetian system, the oil could only be carried to Trieste. It is charged with an *ad valorem* duty of 18 per cent., payable on the export. The quality might be much improved by a little more care in the manufacture, the trees being generally finer than in any other country.

Currants, originally introduced from the Morea, are grown in Zante, Cephalonia, and Ithaca, but principally in the first. The plant is a vine of small size and delicate nature, the cultivation of which requires much care. Six or 7 years elapse after a plantation has been made before it yields a crop. In the beginning of October, the earth about the roots of the plant is loosened, and gathered up in small heaps, away from the vine, which is pruned in March; after which the ground is again laid down smooth around the blight called the "brina," and rainy weather in harvest produces great mischief. The currants are gathered towards September, and after being carefully picked, are thrown singly upon a stone floor, exposed to the sun in the open air. The drying process may occupy a fortnight or longer, if the weather be not favourable. A heavy shower or thunder storm (no unfrequent occurrence at that season) not only interrupts it, but sometimes causes fermentation. The fruit is then only fit to be given to animals. Should it escape these risks, it is deposited in magazines called "*seraglie*," until a purchaser casts up.

The "*seragliente*," or warehouse keeper, delivers to the depositor a paper acknowledging the receipt for the quantity delivered, which passes currently in exchange from hand to hand till the time of export. Under the old Venetian government, the liberty of traffic in this produce was exceedingly restricted. In Zante 5 persons chosen out of the council of nobles assembled in presence of the *proveditore*, regulated what should be the price; and those who wished to purchase were under the necessity of describing to the government the quantity they desired. This system was called the "*collegetto*." The export duties consisted of an original duty of 9 per cent. *ad valorem*; a *dazio fisso*, or fixed duty of about 4*s*. 4*d*. per cwt.; and afterwards of a *novissimo*, or most recent duty, of 2*s*. 2*d*. per cwt. This latter was remitted in favour of vessels bringing salt fish, &c., from the northern ports (chiefly English, Danes, and Dutch): it was afterwards relaxed in favour of Russian vessels from Odessa, and abandoned altogether as vexatious and unproductive. The *proveditore* received in addition 2 per cent., and each of his 2 Venetian councillors 1 per cent.; so that the fruit, the original cost of which was about 9*s*. the cwt., stood the exporter in little less than 18*s*. or 19*s*. Even under British protection, the fruit, which some years before had fetched as much as 30*s*. or 32*s*. the cwt., but had declined in 1832 to 8*s*. the cwt., was burdened with the *dazio fisso* of 4*s*. 4*d*., and a duty of 6 per cent. *ad valorem*, being equivalent together, *at that price*, to an *ad valorem* duty of nearly 60 per cent: In the mean time the import duties in England were raised, in 1829, to the enormous amount of 44*s*. 4*d*. the cwt., which, at the same low price, made an *ad valorem* duty of 500 per cent. The consequences were rapidly visible; a decline took place in the culture of the plant, as well as in the circumstances of the proprietors, whose staple export and means of existence were almost annihilated. As the prices fell, and the distress became greater, the necessitous grower was obliged to borrow money at high interest from foreign merchants, or from the Jews, who were, consequently, able to dictate the price at which they would take his produce. A legislative enactment on a scale commensurate with the difficulties which it had to grapple with, was, after much deliberation, matured and adopted by the Ionian legislature in 1834. It commuted the duties upon currants for an *ad valorem* tax of 19½ per cent. (since reduced to 18 per cent.), being the same as that laid upon oil. The same act increased, in a small degree, the duties previously paid on the importation of coffee, tea, and sugar, and upon foreign wines, silks, and gloves, articles which, being chiefly consumed by the affluent, were more appropriately subjected to an increase of duty, to supply in part the defalcation of revenue consequent to the reduction of the currant duty The good effects of this enactment have been universally admitted. The duty on currants imported into the U. K. was reduced by Sir Robert Peel, in 1844, from 22*s*. 6*d*. to 15*s*. 9*d*. a cwt. (15*s*. +5 per cent.), and it is now 15*s*. Certainly, however, either the duty on currants should be reduced to 10*s*., the new duty on raisins, or the latter should be again raised to the level of the former. The fruits are so nearly allied, and may for most practical purposes be so conveniently substituted for each other, that it is manifestly unfair, and, in fact, unjust, to impose higher duties on the one than on the other.

Salt may be obtained in considerable quantities in Corfu, Zante, and Santa Maura, for exportation: the latter island alone produced it until the late act of parliament, which provided that government should let the salt pans in all the islands to those bidders who should offer, by sealed tenders, to supply it at the lowest rate to the consumer, paying at the same time the highest price to government. No export duty is charged upon it.

These statements show that heavy duties are levied upon the exportation of the staple products of the islands, — an objectionable system, and one which, if it is to be excused at all, can only be so by the peculiar circumstances under which they are placed. There is no land tax or impost on property in the Ionian Islands, such as exists in many other rude countries: and, supposing it were desirable to introduce such a tax, the complicated state of property in them, the feudal tenures under which it is held, and the variety of usages with respect to it, oppose all but invincible obstacles to its imposition on fair and equal principles. At the same time, too, a large amount of revenue is required to meet the expenses of the general and local governments, to maintain an efficient police, and to prevent smuggling and piracy. However, we cannot help thinking that some very material retrenchments might be made from the expenditure; and it is to this source, more, perhaps, than to any other, that the inhabitants must look for any real or effectual relief from their burdens.

The Duties on Exports from the Ionian Islands are regulated by acts dated 8th June, 1855, 26th April, 1837, and 29th May, 1847.

Oil and currants - - pay 18 per cent. *ad valorem*.
Wine (excepting that of the Cefalonia Wine Company) - — 6 — —
Soap - - - pay 8 per cent. *ad valorem*.
Valonia - - - — 6 — —
All other articles - - Free.

N. B. Oil shipped in vessels under Ionian colours for the purpose of being conveyed from one island to another of the states pays only 7 per cent. *ad valorem*.

Account of the Revenue of the Ionian Islands in 1851 and 1852, specifying the different Items, and the Amount of each.

Duties,	Revenue in 1851.	Revenue in 1852.

Ports. — The principal ports in the Ionian republic are Corfu and Zante, in the islands of the same names, and Argostoli in Cephalonia. The city and port of Corfu lie on the east side of the island, on the canal or channel between it and the opposite continent, which is here about 5 miles wide. The citadel, which projects into the sea, is furnished with a light-house, 240 feet high; the latter being in lat. 39° 37′ N., lon. 19° 56′ E. The town is but indifferently built. Population about 18,000, exclusive of the military. The fortifications are very strong, both towards the sea and the land. The canal has deep water throughout; its navigation, which is a little difficult, has been much facilitated by the erection of a light-house on the rock of Tignoso in the northern entrance, where the channel is less than a mile in width; and by the mooring of a floating light off Point Leschimo, in the s uthern entrance. Ships anchor between the small but well fortified island of Vido and the city, in from 12 to 17 fathoms water.

The port, or rather gulph, of Argostoli in Cephalonia, lies on the south-west side of the island. Cape Aji, forming its south-western extremity, is in lat. 38° 8′ 40″ N., lon. 20° 23′ 30″ E. Cape San Nicolo, forming the other extremity, is about 4¾ miles from Cape Aji; and between them, within about 1½ mile of the latter, is the small islet of Guardiani, on which is a light-house. From this island the gulph stretches N. ¼ W., from 7 to 8 miles inland. The town of Argostoli lies on the west side of a haven on the east side of the gulph formed by Point Statura. The situation is low and rather unhealthy. Population about 5,000. Its appearance and police, particularly the latter, have have been much improved since its occupation by the English. There is deep water and good anchorage ground in most parts of the gulph. The best entrance is between Cape San Nicolo and Guardiani, keeping rather more than a mile to the eastward of the latter, on account of a reef that extends N. E. and S.W. from it nearly that distance.

The port and city of Zante are situated on the eastern side of the island, in lat. 37° 47′ N. lon. 20° 54′ 42″ E. The city, the largest in the Ionian islands, extends along the shore for nearly 1½ mile, but it is no where above 300 yards in breadth, except where it ascends the hill on which the citadel is erected. The style of building is chiefly Italian; and the interior of the city displays every where great neatness, and even a certain degree of magnificence. Population estimated by Dr. Burgess at about 20,000. It has a mole or jetty of considerable utility, at the extremity of which a light-house is erected; and a lazaretto, situated a little to the south-west. The harbour is capacious. Ships anchor opposite the town at from 500 to 1,000 yards' distance, in from 12 to 15 fathoms, availing themselves of the protection of the mole when the wind is from the N. E. When our troops took possession of Zante, in 1810, the fortifications were found to be in very bad repair; but immense sums have since been expended upon their improvement and extension.

Trade with England. — This is but of very limited extent. During the year 1850 we imported from the Ionian Islands 138,202 cwt. currants, 305,970 gallons olive oil, and 7,324 qrs. Indian corn. The imports of currants fluctuate with the crop, and are sometimes much larger. The real or declared value of the articles of British produce and manufacture exported to them in 1852, amounted to only 138,642*l.*

The total value of the imports from all countries in 1852 was estimated at 585,283*l.* and that of the exports at 182,372*l.* But a considerable part of the imports is not destined for the consumption of the islands, but is sent thither merely as to a convenient *entrepôt*, being intended for the supply of the contiguous provinces of Greece and Turkey. The amount of exports depends materially on the circumstance whether the year be one in which there is, or is not, a crop of olives, and on the goodness of the currant crops.

In 1852, 566,817 tons shipping entered the ports of the Ionian Islands, of which 27,916 were English. The others were Ionian, Greek, Turkish, &c.

Money. —Accounts are kept in sterling money, or in Spanish dollars and oboli, 100 oboli being = 1 doll. = 4*s.* 4*d.*: a doubloon = 1 dollar.—(*Tate's Cambist.*)

Weights. — English weights and measures are sometimes made use of, though with Italian denominations; but the following are most generally used.

The pound *peso grosso*, or great weight of 12 oz. = 7,384 grains Troy: 94·8 lbs. = 100 lbs. avoirdupois.

The pound *peso sottile*, or small weight used for precious metals and drugs, is 1-3d lighter than the foregoing; 12 oz. peso sottile corresponding to 8 oz. peso grosso.

The oke, used in the southern islands, weighs about 18,900 grains Troy, or 27/10 lbs. avoirdupois. The Levant cantar, or quintal, should contain 44 okes.

The migliajo (1,000 lbs.), for currants in Zante, is 1 per cent. lighter than for other articles.

Measures of Length.—

The Venetian foot is 12 onze = 13¾ inches English.

Passo = 5 Venetian feet.

Braccio, for cloths, &c. = 27 3/16 inches English.

Do. for silks. = 25 3/8

Land is measured by the *misura* or 1/8 of a moggio, or bacile

400 square *passi* being 1 misura, or bacile, about 3/10 of an acre English.

Vineyards are measured by the zappada; 3 zappade (a computed day's work) being 1 misura.

Fire-wood is measured by the square passo, usually, however, only 2 feet thick, this depending on the quality of the wood.

Stone is measured by the passo cubo.

Measures of Capacity.—

Corn.—Corfu and Paxo: Moggio of 8 misure, about 5 Winchester bushels.

Cephalonia: Bacile should contain 80 lbs. peso grosso, best quality wheat.

Santa Maura: Cado, of 8 crivelli, 4 = 3 mog.; 1 cado = 3⅔ bushels English.

Ithaca: 5 Bacile = 1 moggio.

Cerigo: Chilò, the measure of Constantinople, = 1 bushel English.

Wine.—Corfu and Paxo: 32 quartucci = 1 jar, and 4 jars = 1 barrel = 18 English wine gallons.

Cephalonia and Ithaca: 2 quartucci = 1 boccale; 12 boccali = 1 secchio; 6 secchio = 1 barrel = 18 English wine gallons.

Zante: 13 1/3 quartucci = 1 lire; 40 quartucci = 1 jar; 3 jars = 1 barrel = 17 5/8 English wine gallons.

Santa Maura: 22 quartucci = 1 stamno; 6 stamni = 1 barrel = 18 English wine gallons.

Cerigo 2 agosten = 1 boccia; 30 boccie = 1 barrel = 18 English wine gallons.

Oil.—Corfu and Paxo: 4 quartucci = 1 miltro; 6 miltri = 1 jar; 4 jars = 1 barrel = 18 English wine gallons.

Cephalonia: 9 pagliazzi = 1 barrel = 18 Eng. wine galls.

Zante: 9 lire, or 3 jars of 45 qu. each = 1 barrel = 17 5/8 English wine gallons.

Santa Maura: 7 stamni	= 1 barrel	= 18	Eng. wine galls.
Ithaca: 13 pagliazzi	= 1 —	= 18	—
Cerigo: 24 bozze	= 1 —	= 14 9/5	—

Salt. — Centinajo, about 4,000 lbs. Venetian peso grosso.

Lime.—Corfu, measure of 4 English cubic feet.

In compiling this article, we have consulted, besides the works referred to above, the *Voyage Historique, Pittoresque, &c.*, by Saint Sauveur,—a diffuse but valuable work. The account of Zante, in the last volume (tome iii. pp. 101—278.), is particularly good. We have also looked into the *Voyage en Grèce* of Scrofani, 3 tomes, Paris, 1801; the *Archives du Commerce*; the *Papers laid before the Finance Committee, &c.* But the most important part of the information we have been able to lay before the reader was derived from manuscript notes obligingly communicated by Earl Lovelace, who (when Lord King) was secretary to the British government in these islands.

IPECACUANHA (Fr. *Ipecacuanha*; Ger. *Amerikanische brechwurzel*; It. *Ipecoacanna*; Port. *Cipo de camaras, Ipecacuanha*; Sp. *Ipecacuana, Raiz de oro*), the root of a perennial plant (*Cephaëlis ipecacuanha*) growing in Brazil and other parts of South America. It is, from its colour, usually denominated *white, grey*, or *ash-coloured*, and *brown*. Little of the first variety is found in the shops. The grey and brown varieties are brought to this country in bales from Rio Janeiro. Both are in short, wrinkled, variously bent and contorted pieces, which break with a resinous fracture. The grey is about the thickness of a small quill, full of knots and deep circular fissures, that nearly reach down to a white, woody, vascular cord that runs through the heart of each piece; the external part is compact, brittle, and looks smooth: the brown is smaller, more wrinkled, of a blackish brown colour on the outside, and whitish within: the white is woody, and has no wrinkles. The entire root is inodorous; but the powder has a faint disagreeable odour. The taste is bitter, sub-acrid, and extremely nauseous. In choosing ipecacuanha, the larger roots, which are compact and break with a resinous fracture, having a whitish grey, somewhat semi-transparent, appearance in the outside of the cortical part, with a pale straw-coloured medullary fibre, are to be preferred. When pounded, ipecacuanha forms the mildest and safest emetic in the whole materia medica. Though probably employed in America from time immemorial, it was not introduced into Europe till the time of Louis XIV., when one Grenier, a French merchant, brought 150 lbs. of it from Spain, with which trials were made at the Hôtel Dieu. Helvetius first made known its use in dysentery, for which Louis XIV. munificently rewarded him by a douceur of 1,000*l.* sterling.—(*Thomson's Dispensatory; Thomson's Chemistry.*)

IRON (Dan. *Jern*; Du. *Yzer*; Fr. *Fer*; Ger. *Eisen*; It. *Ferro*; Lat. *Ferrum, Mars*; Pol. *Zelazo*; Por. *Ferro*; Rus. *Scheleso*; Sp. *Hierro*; Sw. *Jern*; Gr. Σίδηρος; Sans. *Loha*; Arab. *Hedeed*; Pers. *Ahun*), the most abundant and most useful of all the metals. It is of a bluish white colour; and, when polished, has a great deal of brilliancy. It has a styptic taste, and emits a smell when rubbed. Its hardness exceeds that of most other metals; and it may be rendered harder than most bodies by being converted into steel. Its specific gravity varies from 7·6 to 7·8. It is attracted by the magnet or loadstone, and is itself the substance which constitutes the loadstone. But when iron is perfectly pure, it retains the magnetic virtue for a very short time. It is malleable in every temperature, and its malleability increases in proportion as the temperature augments; but it cannot be hammered out nearly as thin as gold or silver, or even as copper. Its ductility is, however, more perfect; for it may be drawn out into wire as fine at least as a human hair. Its tenacity is such, that an iron wire 0·078 of an inch in diameter, is capable of supporting 549·25 lbs. avoirdupois without breaking.

Historical Notice.—Iron, though the most common, is the most difficult of all the metals to obtain in a state fit for use; and the discovery of the method of working it seems to have been posterior to the use of gold, silver, and copper. We are wholly ignorant of the steps by which men were led to practise the processes required to fuse it and render it malleable. It is certain, however, that it was prepared in ancient Egypt, and some other countries, at a very remote epoch; but it was very little used in Greece till after the Trojan war.—(See the admirable work of *M. Goguet* on the *Origin of Laws, Arts, &c.*, vol. i. p. 140.)

Species of Iron.—There are many varieties of iron, which artists distinguish by particular names; but all of them may be reduced under one or other of the 3 following classes: *cast* or *pig iron*, *wrought* or *soft iron*, and *steel*.

1. Cast or pig iron is the name given to this metal when first extracted from its ores. The ores from which iron is usually obtained are composed of oxide of iron and clay. The object of the manufacturer is to reduce the oxide to the metallic state, and to separate all the clay with which it is combined. This is effected by a peculiar process; and the iron, being exposed to a strong heat in furnaces, and melted, runs out into moulds prepared for its reception, and obtains the name of cast or pig iron.

The cast iron thus obtained is distinguished by manufacturers into different varieties, from its colour and other qualities. Of these the following are the most remarkable:—

a. White cast iron, which is extremely hard and brittle, and appears to be composed of a congeries of small crystals. It can neither be filed, bored, nor bent, and is very apt to break when suddenly heated or cooled

b. Grey or *mottled* cast iron, so called from the inequality of its colour. Its texture is granulated. It is much softer and less brittle than the last variety; and may be cut, bored, and turned on the lathe. Cannons are made of it.

c. Black cast iron is the most unequal in its texture, the most fusible, and least cohesive, of the three.

2. Wrought or soft iron is prepared from cast iron by a process termed a refinement or finery. The wrought iron manufactured in Sweden is reckoned the finest in the world.

3. Steel consists of pieces of wrought iron hardened by a peculiar process. The Swedish iron imported into this country is mostly used in the manufacture of steel. — (See STEEL.) — (*Thomson's Chemistry.*)

Uses of Iron. — To enumerate the various uses of iron would require a lengthened dissertation. No one who reflects for a moment on the subject, can doubt that its discovery and employment in the shape of tools and engines has been of the utmost importance to man; and has done more, perhaps, than any thing else, to accelerate his advance in the career of improvement. Locke has the following striking observations on this subject: — "Of what consequence the discovery of one natural body, and its properties, may be to human life, the whole great continent of America is a convincing instance: whose ignorance in useful arts, and want of the greatest part of the conveniences of life, in a country that abounded with all sorts of natural plenty, I think may be attributed to their ignorance of what was to be found in a very ordinary despicable stone — I mean the mineral of iron. And whatever we think of our parts or improvements in this part of the world, where knowledge and plenty seem to vie with each other, yet, to any one that will seriously reflect upon it, I suppose it will appear past doubt, that, were the use of iron lost among us, we should in a few ages be unavoidably reduced to the wants and ignorance of the ancient savage Americans, whose natural endowments and provisions came no way short of those of the most flourishing and polite nations; so that he who first made use of that one contemptible mineral, may be truly styled the father of arts and author of plenty." — (*Essay on the Understanding*, book iv. c. 12.)

Manufacture of Iron in Great Britain. — We are ignorant of the period when iron began to be made in England, but there is authentic evidence to show that iron works were established by the Romans in the Forest of Dean, in Gloucestershire, and in other parts of the kingdom. — (*Pennant's Wales*, ed. 1810, vol. i. p. 89.) They were also established, at an early period, in Kent and Sussex; these counties being well supplied, not only with iron ore, but (which was at the time of still more importance) with timber, the only species of fuel that was then used in the furnaces. It is to this latter circumstance that the slow increase in the production of iron in England, during a lengthened period, is to be ascribed. Complaints were very early made of the destruction of timber by the iron works; and in the reign of Elizabeth, when an unusual demand for timber for the navy, and for merchant vessels also, took place, the decrease of timber excited a great deal of attention. At length, in 1581, an act was passed prohibiting the manufacturers of iron from using any but small wood, and from establishing any new works any where within 22 miles of the city of London, and 14 miles of the river Thames, and in several parts of Sussex specified in the act. Soon after this, Edward, Lord Dudley, invented a process for smelting iron ore with pit-coal instead of timber; and it is difficult to point out many inventions that have been so advantageous. The patent which his lordship obtained in 1619, was exempted from the operation of the act of 1623 (21 James 1. c. 23.), setting aside monopolies; but though, in its consequences, it has proved of immense value to the country, the works of the inventor were destroyed by an ignorant rabble, and he was well nigh ruined by his efforts to introduce and perfect his process. — (*Report of Committee of House of Commons on Patents*, p. 168, &c.) The invention seems, in consequence, to have been for many years almost forgotten. The complaints of the destruction of timber continued; so much so, that, in 1637, the exportation of iron without licence was prohibited, and fresh restrictions were laid on the felling of timber. But the evil could not be abated by such means; and, in the early part of last century, complaints of the destruction of timber by the iron works became more prevalent than ever, and their total suppression began to be contemplated as a lesser evil than the continued decrease of the stock of timber. At this period more than two thirds of the iron made use of was imported, and the condition of the manufacture was most unprosperous. But the growing scarcity and high price of timber, coupled with the increasing demand for iron, at last succeeded in drawing the attention of some ingenious persons to Lord Dudley's process; and, about 1740, iron was made at Colebrook Dale, and one or two other places, by means of pit-coal, of about as good a quality as that made with timber. From this period the business steadily increased; at first, however, its progress was comparatively slow, and the furnaces of Kent and Sussex were not wholly relinquished for more that 80 years after iron began to be largely produced by means of pit-coal. The great demand for iron occasioned by the late war, and the obstacles which it threw in the way of supplies from abroad, gave the first extraordinary stimulus to the manufacture, which has now become of vast importance and great value. In 1740 the quantity of pig-iron made in England and Wales amounted to about 17,000 tons, produced by 59 furnaces Since this epoch the increase is believed to have been nearly as follows; viz: — in 1750. 22,000 tons; in 1788, 68,000 tons, produced by 85 furnaces; in 1796, 125,000 tons, produced by 121 furnaces; in 1806, 250,000 tons, produced by 169 furnaces; and in 1820. about 400,000 tons, were produced, but their is no account of the number of furnaces. From extensive inquiries made by government and others connected with the iron trade, the following statements have been deduced, which exhibit the districts in which iron is made, the number of furnaces, and the total quantity produced in 1825, 1840, and 1848.

Account of the Number of Furnaces, and of the Quantities of Iron in Tons produced in Great Britain, in 1825, 1840, and 1848.

	Total Furnaces in 1825.	Produce of Iron in 1825.	Total Furnaces in 1840.	Produce of Iron in 1840.	Total Furnaces in 1848.	Produce of Iron in 1848.
Forest of Dean	-	-	4	15,000	-	-
South Wales	107	230,412	163	505,000	196	706,680
North Wales	14	17,756	15	26,500	11	16,170
Northumberland	-	-	6	11,000	36	100,000
Yorkshire	34	39,104	32	56,000	28	66,560
Derbyshire	19	22,672	18	31,000	30	95,000
Staffordshire	107	182,156	151	427,650	158	385,840

Scotland	25	33,540	70	241,000	130	550,000
Totals	354	615,236	490	1,395,900	623	2,008,200

The increase in the interval has been, if possible, still greater than that exhibited above. And in proof of this we have merely to direct the reader's attention to the following, compiled from returns collected by Mr. Hunt, Keeper of Mining Records, the highest authority on such subjects.

Number of Iron Furnaces and make of Iron in the U. Kingdom in 1857.

County.	No. of Iron Works.	No. of Furnaces built.	No. of Furnaces in blast.	Produce of Pig-iron.
England: Northumberland	8	18	6	63,250
Durham	15	51	35	284,500

Scotland	32	165	124	918,000
Ireland	1	1	1	1,000
Totals	252	823	628	3,659,447

This astonishing increase has been owing to a great variety of causes, among the more prominent of which may be specified the greater cheapness of iron, and its consequent application to a great many purposes, including the construction of various descriptions of agricultural implements, pipes for the conveyance of water, and the building of ships, for which it was not formerly supposed to be applicable. Unquestionably, however, the unprecedented demand of iron for railways in this country, and in the United States and the Continent, has, within the last 10 years, given the most powerful stimulus to the manufacture; and, if only half the railway projects on foot in 1847 had been executed, the production of the iron, vast as it has been, would have been quite inadequate to supply the demand.

It will, however, readily occur to the reader that a demand for iron for railways, depending as the formation of the latter does on many varying circumstances, must necessarily be both capricious and fluctuating; and hence it is not really possible to infer from the state of the iron trade at any given period what may be its state a few months after. In 1842 and 1843 the price of pig-iron had sunk to from 2*l.* to 2*l.* 10*s.* per ton, and the manufacturers in the least favoured districts were involved in the greatest difficulties. But subsequently the price of iron doubled or trebled; and though it has again receded, larger fortunes have been made in this than in any other department of industry. Similar mutations will, doubtless, take place in future. On the whole, however, the fair presumption seems to be that the manufacture will go on increasing for an indefinite period. The uses to which iron may be applied seem to be all but infinite; and every fall of its price stimulates invention and introduces it into new channels. Most probably, indeed, the works situated in the least favoured districts, or those where iron is produced at the greatest expense, will, in the course of time, have to be abandoned. This, however, is merely a local and accidental grievance, and can in nowise affect the general well-being of the business.

The employment of the hot-blast, or of air heated to a high temperature, instead of common atmospheric air in the working of furnaces, has been one of the greatest improvements in the manufacture, and has at once reduced the cost of iron and increased its quantity. It was first used in Lanarkshire, in Scotland, and has been one of the principal causes of the extraordinary extension of the trade in that part of the empire, where it is now universally made use of.

Taking the annual produce of pig-iron in the United Kingdom at 3,500,000 tons,

and supposing that about 3 tons of coal are required for the production of each ton of iron, the consumption of coal in this branch of the iron trade will, on this hypothesis, amount to 10,500,000 tons a year; and adding to this quantity 6,000,000 tons for the coal required for the conversion of pig-iron into bar-iron, it follows that a supply of no fewer than 16,500,000 tons of coal will be annually required in this single department of industry! And hence, also, the fact that the consumption of coal in the production of iron is nearly four times as great as its consumption in the metropolis!

From 3-10ths to 4-10ths of the total quantity of iron produced is used in the state of pig, or cast-iron, and is consumed principally in Great Britain and Ireland. The exports of pig-iron, however, amounted in 1857 to about 422,000 tons, sent principally to France, the United States, Holland, Prussia, and British N. America. The residue is converted into wrought iron, being formed into bars, bolts, rods, &c. The exports of bar-iron amounted, in 1857, to 737,000 tons! and during the same year, the exports of all sorts of iron reached the prodigious amount of 1,539,386 tons! which, at 8*l.* a ton, would be worth above 12,000,000*l.* And their declared value did in fact amount, in 1857, to 13,603,337*l.*, and in 1858 to 11,197,072*l.*

Supposing the total quantity of pig-iron produced in Great Britain to amount to 3,500,000 tons a year, and to be worth, at an average, 4*l.* a ton, its total value will be 14,000,000*l.*; and the additional labour expended in forming the pig-iron into bar-iron, that is, into bars, bolts, rods, &c., may probably add about 5,000,000*l.* more to its value; making it worth in all about 19,000,000*l.* And if we recollect that wrought iron is to the hardware manufacture what malt is to the manufacture of beer, and leather to that of shoes, we shall be satisfied alike of its paramount importance in the arts and as a most prolific source of employment and of public wealth.

Account of the different Descriptions of Iron (including unwrought Steel) exported from the U. Kingdom during 1857, specifying the Quantities sent to the different Countries.

Countries to which exported.	Iron, Pig.	Bar Iron.	Bolt and Rod Iron.	Cast Iron.	Iron Wire.	Wrought Iron.			Iron, old, for re-manufacture.	Steel, unwrought.

Making a grand total of 1,539,386 tons.

Previously to 1845, the imports of foreign iron usually varied from 20,000 to 25,000 tons a year. But at that epoch the duties on foreign iron (20*s.* a ton on iron in bars) were repealed; and there has since been an increase in the imports of Swedish bar-iron, which is especially well fitted for being made into steel. The imports of all sorts of foreign iron amounted, in 1857, to 50,163 tons, whereof 44,282 tons were from Sweden.

Perhaps in nothing has the fall of price, consequent to the diminution of the cost of production, that has taken place since the peace of 1815, been more conspicuous than in hardware. At an average, articles of hardware are at present (1859) from 50 to 75 per cent. lower than in 1820. And it may be safely affirmed that there are very few descriptions of articles in which a fall of price would have been so advantageous.

IRON-WOOD (Ger. *Eisenholz;* Du. *Yserhout;* Fr. *Bois de fer;* It. *Legno di ferro;* Sp. *Plo hierro;* Lat. *Sideroxylon, Lignum ferreum*), a species of wood of a reddish cast, so called on account of its corroding as that metal does, and its being remarkably hard and ponderous,—even more so than ebony. The tree which produces it grows principally in the West India Islands, and is likewise very common in South America, and in some parts of Asia, especially about Siam.

ISINGLASS (Ger. *Hausenblase, Hausblase;* Fr. *Colle de Poisson, Carlock;* It. *Cola di pesce;* Rus. *Klei rübiii, Karluk*), one of the purest and finest of the animal glues. It is a product the preparation of which is almost peculiar to Russia. It is made of the air-bladders and sounds of different kinds of fish which are found in the large rivers that fall into the North Sea and the Caspian. That prepared from the sturgeon is generally esteemed the best; next to that the beluga; but isinglass is also prepared from sterlets, shad, and barbel, though not so good. The best is usually rolled in little ringlets; the second sort is laid together like the leaves of a book; and the common sort is dried without any care. When fine, it is of a white colour, semi-transparent and dry. It dissolves readily in boiling water, and is used extensively in cookery. It is also used for stiffening silk, making sticking-plaster, &c. The duty on isinglass, which formerly amounted to 47*s.* 6*d.* a cwt., was wholly repealed in 1853. In 1857 the imports and exports were respectively 1,493 cwt. and 166 do. The price varies from 5*s.* to 15*s.* per lb.—(See *Thomson's Chemistry; Tooke's View of Russia*, 2d. ed. iii. 343, &c.)

ISLE OF MAN. See MAN, ISLE OF.

JUICE OF LEMONS, LIMES, OR ORANGES. The 9th section of the act 6 Geo. 4. c. 111. is as follows:—"For ascertaining the degrees of specific gravity or strength, according to which the duty on the juice of lemons, limes, and oranges shall be paid, it is enacted that the degrees of such specific gravity or strength shall be ascertained by a glass citrometer, which shall be graduated in degrees in such manner that distilled water being assumed as unity at the temperature of 60° by Fahrenheit's thermometer, every degree of the scale of such citrometer shall be denoted by a variation of $\frac{4}{1000}$ parts of the specific gravity of such water."

JUNIPER BERRIES. See BERRIES.

IVORY, the name given to the teeth or tusks of the elephant, and of the walrus or sea-horse. Each male elephant come to maturity has 2 tusks. These are hollow at the root, tapering, and of various sizes, depending principally on the age of the animal. Colour externally yellowish, brownish, and sometimes dark, internally white. The best are large, straight, and light-coloured, without flaws; not very hollow in the stump, but solid and thick. The most esteemed come from Africa, being of a closer texture, and less liable to turn yellow, than those from the East Indies.

The trade in London thus divide them:—

First sort, weighing 70 lbs. or upwards; second sort, weighing 56 lbs. to 60 lbs.; third sort, weighing 38 lbs. to 56 lbs.; fourth sort, weighing 28 lbs. to 37 lbs.; fifth sort, weighing 18 lbs. to 27 lbs.

All under 18 lbs. are called *scrivelloes*, and are of the least value. In purchasing elephants' teeth, those that are very crooked, hollow, and broken at the ends, of cracked and decayed in the inside, should be rejected; and care taken that lead or any other substance has not been poured into the hollow. The freight is rated at 16 cwt. to the ton.—(*Milburn's Orient. Com.*)

Supply of Ivory.—The imports of elephants' teeth amounted in 1857 to 9,890 cwt., of which 2,576 cwt. were exported. The medium weight of a tusk may be taken at about 60 lb., so that the importation of 1857 may be taken at 18,400 tusks; a fact which presumes the destruction of at least 9,200 male elephants! But, supposing the tusks could only be obtained by killing the animal, the destruction would really be a good deal greater, and would most probably, indeed, amount to about 12,000 elephants. Occasionally, however, tusks are accidentally broken, one lost in this way being replaced by a new one; a good many are also obtained from elephants that have died in the natural way; and some more are the produce of the walrus. Still it is sufficiently certain, that the supply from the last mentioned sources is not very large; and if to the quantity of ivory required for Great Britain, we add that required for the other countries of Europe, America, and Asia, the slaughter of elephants must, after every reasonable deduction is made, appear immense. Inasmuch, however, as this destruction falls only on the males, there is less foundation than might at first be supposed, for the surprise that has sometimes been expressed that the breed of this noble animal has not been more diminished. The western and eastern coasts of Africa, the Cape of Good Hope, Ceylon, India, and the countries to the eastward of the Straits of Malacca, are the great marts whence supplies of ivory are derived. The imports from Western Africa into

Great Britain in 1857, amounted to 1,543 cwt.; the Cape, &c. furnished 1,192 cwt., and India and Ceylon, 3,349 do. The Chinese market is principally supplied with ivory from Malacca, Siam, and Sumatra.

The chief consumption of ivory in England is in the manufacture of handles for knives; but it is also extensively used in the manufacture of musical and mathematical instruments, chess-men, billiard-balls, plates for miniatures, toys, &c. Ivory articles are said to be manufactured to a greater extent, and with better success, at Dieppe than in any other place in Europe. But the preparation of this beautiful material is much better understood by the Chinese than by any other people. No European artist has hitherto succeeded in cutting concentric balls after the manner of the Chinese: and their boxes, chess-men, and other ivory articles, are all far superior to any that are to be met with anywhere else.

Historical Notice.—It is a curious fact, that the people of all Asiatic countries in which the elephant is found, have always had the art of taming the animal and applying it to useful purposes, but that no such art has ever been possessed by any native African nation. Is this owing to any difference between the Asiatic and African elephants, or to the inferior sagacity of the African people? We incline to think that the latter is the true hypothesis. Alexander the Great is believed to have been the first European who employed elephants in war. It appears pretty certain that the elephants made use of by the Carthaginians were mostly, if not wholly, brought from India; and that they were managed by Indian leaders. Some of the latter were captured by the Romans, in the great victory gained by Metellus over Asdrubal.—(See, on this curious subject, two very learned and valuable notes in the *Ancient Universal History*, 8vo. ed. vol. xvii. p. 429. and p. 549. *Buffon's Article on the Elephant* is a splendid piece of composition.)

The duty of 1*l.* per cwt. on ivory was repealed in 1866.

The price per cwt. of elephants' teeth in the London market, in April 1859, was—

	£	s.	d.		£	s.	d.		£	s.	d.		£	s.	d.

56 - - 70 —	38	0	0	— 42	0	0		20 — 35 —	28	0	0	— 35	0	0	

K.

KELP. A substance composed of different materials, of which the fossil or mineral alkali, or, as it is commonly termed soda, is the chief. This ingredient renders it useful in the composition of soap, in the manufacture of alum, and in the formation of crown and bottle glass. It is formed of marine plants, which, being cut from the rocks with a hook, are collected and dried on the beach to a certain extent; they are afterwards put into kilns prepared for the purpose, the heat of which is sufficient to bring the plants into a state of semi-fusion. They are then strongly stirred with iron rakes; and when cool, condense into a dark blue or whitish mass, very hard and solid. Plants about 3 years old yield the largest quantity of kelp. The best kelp has an acrid caustic taste, a sulphurous odour, is compact, and of a dark blue greenish colour. It yields about 5 per cent. of its weight of soda.—(*Barry's Orkney Islands*, p. 377.; *Thomson's Dispensatory.*)

The manufacture of kelp is, or rather *was*, principally carried on in the Western Islands, and on the western shores of Scotland, where it was introduced from Ireland, about the middle of last century. Towards the end of the late war, the kelp shores of the island of North Uist let for 7,000*l.* a year. It has been calculated that the quantity of kelp annually manufactured in the Hebrides only, exclusive of the mainland, and of the Orkney and Shetland Isles, amounted, at the period referred to, to about 6,000 tons a year; and that the total quantity made in Scotland and its adjacent isles amounted to about 20,000 tons. At some periods during the war, it sold for 20*l.* a ton; but at an average of the 23 years ending with 1822, the price was 10*l.* 9*s.* 7*d.*—(Art. *Scotland*, *Edinburgh Encyclopædia.*)

Unluckily, however, the foundations on which this manufacture rested were altogether factitious. Its existence depended on the maintenance of the high duties on barilla and salt. Inasmuch, however, as kelp could not be substituted, without undergoing a very expensive process, for barilla, in a great many departments of industry in which the use of mineral alkali is indispensable, it became necessary materially to reduce the high duty laid on barilla during the war. The ruin of the kelp manufacture has been ascribed to this reduction; but though barilla had been altogether excluded from our markets, which could not have been done without great injury to many most important manufactures, the result would have been perfectly the same, in so far as kelp is concerned, unless the high duty on salt had also been maintained. It was the repeal of the latter that gave the kelp manufacture the *coup de grace*. The purification of kelp, so as to render it fit for soap-making, is a much more troublesome and expensive process than the decomposition of salt; and the greatest quantity of alkali used, is now obtained by the latter method. Had the duty on salt not been repealed, kelp might still have been manufactured, notwithstanding the reduction of duty on barilla.

The manufacture is now almost extinct. Shores that formerly yielded the proprietors a rent of 200*l.* to 500*l.* a year, are now worth next to nothing. The price of kelp since 1822 has not been, at an average, above 4*l.* a ton; and the article will, most probably, soon cease to be produced.

This result, though injurious to the proprietors of kelp shores, and productive of temporary distress to the labourers employed in the manufacture, is not to be regretted. It could not have been obviated, without keeping up the price of some of the most important necessaries of life at a forced and unnatural elevation. The high price of kelp was occasioned by the exigencies of the late war, which, besides obstructing the supply of barilla, forced government to lay high duties on it and on salt. The proprietors had not the vestige of a ground for considering that such a state of things would be permanent; they did right in profiting by it while it lasted; but they could not expect that government was to subject the country, during peace, to some of the severest privations occasioned by the war, merely that *they* might continue to enjoy an accidental advantage.

KENTLEDGE, the name sometimes given to the iron pigs cast in a particular form for ballasting ships, and employed for that purpose.

KERMES (Ger. *Scharlachbeeren*; Du. *Grein Scharlakenbessen*; It. *Grana, Chermes, Cremese, Cocchi*; Sp. *Grana Kermes, Grana de la coscoja*), an insect (*Coccus ilicis* Lin.) of the same species as the true Mexican cochineal, found upon the *quercus ilex*, a species of oak growing in Spain, France, the Levant, &c. Before the discovery of America, kermes was the most esteemed drug for dyeing scarlet, and had been used for that purpose from a very remote period. Beckmann inclines to think that it was employed by the Phœnicians, and that it excelled even the famous Tyrian purple. — *Hist. of Invent.* vol. ii. p. 197. Eng. ed.) From the name of *coccum* or *coccus*, cloth dyed with kermes was called *coccinum*, and persons wearing this cloth were said by the Romans to be *coccinati*. — (*Mart.* lib. i. epig. 97. lin. 6.) It is singular, however, notwithstanding its extensive use in antiquity, that the ancients had the most incorrect notions with respect to the nature of kermes; many of them supposing that it was the grains (*grana*) or fruit of the *ilex*. This was Pliny's opinion: others, after him, considered it in the same light, or as an excrescence formed by the puncture of a particular kind of fly, like the gall nut. It was not till the early part of last century that it was finally and satisfactorily established that the kermes is really nothing but an insect, assuming the appearance of a berry in the process of drying. The term kermes is of Persian origin. The Arabians had been acquainted with this production from the earliest periods in Africa; and having found it in Spain, they cultivated it extensively as an article of commerce, as well as a dye drug for their own use. But since the introduction of cochineal, it has become an object of comparatively trifling importance. It is still, however, prepared in some parts of Spain. Cloths dyed with kermes are of a deep red colour; and though much inferior in brilliancy to the scarlet cloths dyed with real Mexican cochineal, they retain the colour better, and are less liable to stain. The old tapestries of Brussels, and other places in Flanders, which have scarcely lost any thing of their original vivacity, though 200 years old, were all dyed with kermes. The history of this production has been treated with great learning by Beckmann (*Hist. of Invent.* vol. i. pp. 171—191. 1st ed. trans.); and by Dr. Bancroft (*Permanent Colours*, vol. i. pp. 393—409.)

KINO (Fr. *Gomme de Kino*; Ger. *Kinoharz*; It. *Chino*), a gum, the produce of trees that grow in the East and West Indies, Africa, Botany Bay, &c. The kino now found in the shops is said by Dr. A. T. Thomson to come from India, and to be the produce of the *nauclea gambir*. The branches and twigs are bruised and boiled in water. The decoction is then evaporated until it acquires the consistence of an extract, which is kino. It is imported in chests containing from 1 to 2 cwt.; and on the inside of the lid of each chest is a paper, inscribed with the name of John Brown, the month and year of its importation, and stating that it is the produce of Amboyna. It is inodorous, very rough, and slightly bitter when first taken into the mouth; but it afterwards impresses a degree of sweetness on the palate. It is in small, uniform, deep brown, shining, brittle fragments, which appear like portions of a dried extract broken down; being perfectly uniform in their appearance. It is easily pulverised, affording a powder of a lighter brown colour than the fragments. But it may be doubted whether the inspissated juice of the *nauclea gambir* ought to be considered as kino. Dr. Ainslie says that Botany Bay kino is the only kind he had seen in an Indian bazaar. The tree which yields it grows to a great height: it flows from incisions made into the wood of the trunk. — (*Thomson's Dispensatory*; *Ainslie's Materia Indica.*)

KNIVES. (Ger. *Messer*; Du. *Messen*; Fr. *Couteaux*; It. *Coltelli*; Sp. *Cuchillos*; Rus. *Noshi*) well known utensils made of iron and steel, and employed to cut with: they are principally manufactured in London and Sheffield. Knives are made for a variety of purposes, as their different denominations imply; such as table knives, penknives, oyster knives, pruning knives, &c. Although England at present excels every part of the world in the manufacture of knives, as in most branches of cutlery, the finer kinds were imported until the reign of Elizabeth. It is stated by Mr. Macpherson (*Annals of Com., Anno* 1563), that knives were not made for use in England till 1563; but there can be no doubt that this is an error. They had been made, though probably of a rude and clumsy pattern, for centuries before, in the district called Hallamshire, of which Sheffield is the centre; and the cutlers of London were formed into a corporation in 1417. — (*Manufactures in Metal*, vol. ii. c. i., in *Lardner's Cyclopædia.*)

KÖNIGSBERG, the capital of East Prussia, in lat. 54° 42′ 11″ N., lon. 20° 29′ 15″ E. Population, in 1855, 77,748.

Port, &c.—Königsberg is situated on the Pregel, which flows into the Frische Haff, or Fresh Bay, a large lake having from 10 to 14 feet water. The bar at the mouth of the Pregel has only from 10 to 11 feet water, so that vessels of more than that draught of water require to be lightered to come up to Königsberg. Pillau, in lat. 54° 33′ 39″ N., lon. 15° 52′ 30″ E. on the north side of the entrance from the Baltic to the Frische Haff, is properly the port of the town. Within these few years, a lighthouse

has been erected on a rising ground, a little to the south of Pillau, the lantern of which is elevated 95 feet above the level of the sea. The light is fixed and brilliant. The entrance to the harbour is marked by buoys; those on the larboard side being surmounted by small flags. A Gothic building, 120 feet above the level of the sea, has been erected to serve for a land-mark; at a distance it looks like a three-masted ship under sail. There is usually from 15 to 16 feet water between the buoys on entering the harbour; but particular winds occasion material differences in this respect.

Trade of Königsberg.—Being situated on a navigable river of considerable importance, Königsberg has a large command of internal navigation, and is the principal emporium of a large extent of country. Wheat, rye, and other species of grain are the chief articles of export. The wheat is somewhat similar to that of Dantzic, but of inferior quality, being larger in the berry, and thicker skinned. The rye is of good quality, but barley, with few exceptions, is thin and light. A few remarkably large and fine peas are exported; but the bulk are of small size and inferior. Oats are common feed, with a slight admixture of tares, but as these last answer in some degree the purpose of beans, the value of the oats is rather enhanced than otherwise by the circumstance. More tares are shipped here than from any other port in the Baltic. The price of all sorts of grain is usually lower at Königsberg than at the neighbouring Prussian ports. Linseed and rapeseed, hemp, flax, linens, oil-cake, oil, bristles, refined sugar, &c., are largely exported; with smaller quantities of bones, mats, ashes, feathers, wax, hides and skins, &c. The bristles are the best in the Baltic. Timber, deals, and staves are as good as at Memel, but being scarce, few or none are exported. The imports are sugar, tea, herrings, iron and steel, coffee, wines, tin and tin plates, dye woods, tobacco, spices, drugs, coals, &c. Salt is a government monopoly; any person being allowed to import it, but he must either sell it to government at a price fixed by them, or export it again.

Money, Weights, and Measures, same as at DANTZIC; which see.

We subjoin some statements with respect to the trade of Königsberg in 1858.

Exports. — The exportation by sea of corn, grain, and seeds, was as follows, viz.,

	Lasts.	Quarters.		Lasts.	Quarters.
Wheat	12,670	142,500	Tares	362	4,070
Rye	24,816	279,180	Linseed	4,903	55,150
Barley	3,177	35,740	Other seeds	1,437	16,160
Oats	7,979	90,000			
Peas	4,187	47,100	Total	60,563	681,500
Beans	1,052	11,600			
			In 1857	52,492	590,000

The year 1858 was the most important for the quantity of grain exported for many years past, exceeding even that of 1843, which was considered as the greatest on record. The exportation in that year amounted to 60,078 lasts. In 1858, 1,500 lasts were forwarded to Germany by railway.

Prices of Wheat, of good mixed and red quality, of 130 to 132 lbs., Dutch weight, rose from April to July from 36*s.* 7*d.* to 39*s.* 11*d.* per quarter to 44*s.* 1*d.* to 47*s.* 3*d.* per quarter, and then declined again to 39*s.* 10*d.* to 43*s.* High mixed wheat was worth 1*s.* to 3*s.* per quarter more.

Flax and Hemp. — The trade in flax was more than usually lively. The German spinners consumed considerably more than usual. The export by sea was about 2,300 tons to foreign countries, 500 tons by steam boats to Stettin, and 1,800 tons by rail to Germany, — total, 4,600 tons. About 1,200 tons of flax and codilla, chiefly of lower quality, remained on stock on 31st December. The average value of the exported flax was about 45*l.* per ton. Only about 150 tons of hemp were exported by sea to foreign countries in this year. The inland consumption, including the interior of Germany, was nearly 2,000 tons; the finer sorts were sparingly imported from Russia, and prices continually receded. Stocks on hand on 31st December about 2,200 tons.

Oil Cakes. — The trade in this article was from various reasons much curtailed, although the price of linseed cake rose to 8*s.* per cwt.; the low price of oil interfered with the profits of the manufacturers, and but little came for exportation. The export of cake by sea was 4,500 tons.

The imports consist principally of sugar, coffee, and other articles of colonial produce; cottons and cotton yarn; iron and hardware, and machinery; herrings, and other salt fish; spirits and wine; tea and tobacco; coals; with a great variety of other articles. In consequence of the preference accorded to beet root, and its increased cultivation, the imports of colonial sugar have been progressively diminishing.

In 1855, 65 vessels imported about				14,780 tons.

For an account of the shipping belonging to Königsberg, see DANTZIC.

L.

LAC, OR GUM LAC (Ger. *Lack, Gummilack;* Fr. *Lacque, Gomme lacque;* It. *Lacca, Gommalacca;* Sp. *Goma laca;* Rus. *Laka, Gummilak;* Arab. *Laak;* Hind. *Lak'h;* Sans. *Lākshā*), a substance, which has been improperly called a gum, produced in Bengal, Assam, Pegu, Siam, &c. on the leaves and branches of certain trees, by an insect (*Chermes lacca*). The trees selected by the insect on which to deposit its eggs are known by the names of the bihar tree (*Croton laccíferum* Lin.), the pepel (*Butea frondosa*), bott, and coosim trees, &c. After being deposited, the egg is covered by the insect with a quantity of this peculiar substance, or lac, evidently intended to serve, in the economy of nature, as a nidus and protection to the ovum and insect in its first stage, and as food for the maggot in its more advanced stage. It is formed into cells, finished with as much art as a honeycomb, but differently arranged. Lac yields a fine red dye, which, though not so bright as the true Mexican cochineal, is said to be more permanent; and the resinous part is extensively used in the manufacture of sealing wax and hats, and as a varnish.

Lac, when in its natural state, encrusting leaves and twigs, is called *stick lac:* it is collected twice a-year; and the only trouble in procuring it is in breaking down the leaves and branches, and carrying them to market. When the twigs or sticks are large, or only partially covered, the lac is frequently separated from them, as it always ought to be when shipped for Europe, to lessen the expense of freight. The best stick lac is of a deep red colour. When held against the light, it should look bright, and when broken should appear in diamond-like points. If it be not gathered till the insects have left their cells, it becomes pale, and pierced at the top; and it is of little use as a dye, though probably better for a varnish.

Lac dye, lac lake, or *cake lac,* consists of the colouring matter extracted from the stick lac. Various processes have been adopted for this purpose. It is formed into small square cakes or pieces, like those of indigo. It should, when broken, look dark-coloured, shining, smooth, and compact; when scraped or powdered, it should be of a bright red colour, approaching to that of carmine. That which is sandy, light-coloured, and spongy, and which, when scraped, is of a dull brickdust colour, should be rejected.

Notwithstanding the continued fall in the price of cochineal, the use of lac dye has been extending in this country. The annual consumption may at present (1853) amount to about 1,200,000 lbs., having more than quintupled since 1818. The finest qualities of lac dye are seldom met with for sale in Calcutta, being generally manufactured under contract for the European market.

When stick lac has been separated from the twigs to which it naturally adheres, and coarsely pounded, the native silk and cotton dyers extract the colour as far as it conveniently can be done by water. The yellowish, hard, resinous powder which remains, having somewhat of the appearance of mustard seed, is called *seed lac.* When liquefied by fire, it is formed into cakes, and denominated *lump lac.* The natives use the latter in making bangles, or ornaments in the form of rings, for the arms of the lower class of females; the best *shellac* being used in manufacturing these ornaments for the superior classes.

Shellac is produced from seed lac, by putting the latter into bags of cotton cloth, and holding it over a charcoal fire, when the lac melts, and being strained through the bag, the resinous part, which is the most liquefiable, is obtained in a considerable degree of purity; it is formed into thin sheets or plates. Thin, transparent, or amber-coloured shellac is best; avoid that which is thick, dark, or speckled; it should always, when broken, be amber-coloured on the edge; that which has a dark brown fracture, however thin, should be rejected. When laid on a hot iron, shellac, if pure, will instantly catch fire, and burn with a strong but not disagreeable smell. It used to be principally employed in this country in the manufacture of sealing wax, and as a varnish; but it is now very extensively used in the manufacture of hats: the quantity retained for consumption in 1851 amounted to 11,868 cwts.

In Bengal, lac is chiefly produced in the forests of Sylhet and Burdwan. The finest dye is said to be obtained from the stick lac of Siam and Pegu; but the shellac, or resinous part obtained from the latter, is inferior to that produced from Sylhet stick lac. It may be obtained in almost any quantity.

The duties formerly charged on lac when entered for consumption were repealed in 1845.

In 1857, 19,736 cwts. of shellac were imported, and 11,483 cwts. exported. During the same year the imports and exports of lac dye were respectively 12,196 cwts. and 4,293 cwts.

The finest lac dye is distinguished by the mark D.I., the 2d by D. T., the 3d by J. Mc. R., C. E., &c. The prices vary from 6d. to 2s. 5d. per lb.

The duties used to be 5 per cent. on lac dye, seed lac, and stick lac; and 20 per cent. on shellac; but it was obviously absurd to charge shellac, which, as already seen, is prepared from the refuse of lac dye, with *four* times the duty laid upon the latter. In 1842, the duties were reduced to 1s. a cwt., and, as already seen, were repealed in 1845.—(*Bancroft on Permanent Colours*, vol. ii. pp. 1—60.; *Ainslie's Mat. Med.*; *Milburn's Orient. Com.*; and *private information.*)

LACE (Du. *Kanten;* Fr. *Dentelle;* Ger. *Spitzen;* It. *Merletti, Pizzi;* Rus. *Krushewo;* Sp. *Encajes*), a plain or ornamented net-work, tastefully composed of many fine threads of gold, silver, silk, flax, or cotton, interwoven, from *Lacinia* (Lat.), the guard hem or fringe of a garment.

The origin of this delicate and beautiful fabric is involved in considerable obscurity; but there is no doubt it lays claim to high antiquity. In Mr. Hope's Costumes of the Ancients, many beautiful lace patterns are portrayed on the borders of the dresses of

Grecian females; and from the derivation of the word "*lace*," it is probable it was not unknown to the Romans. It is supposed that Mary de' Medici was the first who brought lace into France, from Venice, where, and in the neighbouring states of Italy, it is understood to have been long previously worn; but we find that in England, so early as 1483, "laces of thread, and laces of gold, and silk and gold," were enumerated among the articles prohibited to be imported.—(1 *Rich.* 3. c. 10.) It is, therefore, fair to presume that this manufacture had begun in England *prior* to that period, as this and many subsequent acts were passed—(19 Hen. 7. c. 21.; 5 Eliz. c. 7.; 13 & 14 Car. 2. c. 18.; 4 & 5 W. & M. c. 10., &c.)—for the encouragement and protection of our home manufacture; but it may equally be concluded, that as *pins* (which are indispensable in the process of lace making) were not used in England till 1543, the manufacture of lace must have been vulgar in fabric, and circumscribed in its extent. Tradition says that the lace manufacture was introduced into this country by some refugees from Flanders, who settled at or near Cranfield, now a scattered village on the west side of Bedfordshire, and adjoining Bucks; but there is no certain evidence that we are indebted to the Flemings for the introduction of this beautiful art, though we undoubtedly owe to them most part of our manufactures of articles of dress; we have also imitated many of their lace fabrics, and greatly improved our manufacture, by profiting by the superior taste which they have displayed in the production of this article. In 1626, Sir Henry Borlase founded and endowed the free school at Great Marlow, for 24 boys, to read, write, and cast accounts; and for 24 girls, to knit, spin, and make *bone lace*—(*Lewis' Topography*); so that there is reason to suppose that at this time the manufacture had commenced in Buckinghamshire, which by degrees extended to the adjoining counties of Bedford and Northampton. In 1640, the lace trade was a flourishing interest in Buckinghamshire—(*Fuller's Worthies*, and different *Itineraries*); and so greatly had it advanced in England, that by a royal ordinance in France, passed in 1660, a mark was established upon the thread lace *imported from this country* and from Flanders, and upon the point lace from Genoa, Venice, and other foreign countries, in order to secure payment of the customs duties.—(*Universal Dictionary.*)

Pillow Lace—the original manufacture—is worked upon a hard stuffed pillow, with silk, flax, or cotton threads, according to a parchment pattern placed upon it, by means of pins, bobbins, and spindles, which are placed and displaced, twisting, and interweaving the threads, so as to imitate the pattern designed. This manufacture has been long pursued in almost every town and village in the midland counties, particularly in Buckinghamshire, Bedfordshire, and Northamptonshire, besides at Honiton, in Devon, and various other places in the west of England. The principal places where it is made in the Netherlands are Antwerp, Brussels, Mechlin, Louvaine, Ghent, Valenciennes, and Lisle. It is also made at Chantilly near Paris (celebrated for veils), Charleville, Sedan, Le Comptè de Bourgoyne, Liege, Dieppe, Havre, Harfleur, Pont l'Evesque, Gosors, Fecamp, Caen. Arras, Bapaume, &c. in France; and at various places in Spain, Portugal, and Italy. In England and Ireland, besides the laws passed at different times to encourage and protect the manufacture, associations were formed in various places, with the view of exciting a spirit of emulation and improvement, by holding out premiums for the production of the best pieces of bone lace; and although smuggling of foreign lace was carried on to a great extent, (in 1772, 72,000 ells of French lace were seized in the port of Leigh, and lodged in the king's warehouse there, besides numerous other seizures,) the British manufacture advanced in an unparalleled degree.—(*Gentleman's Mag.* 1751, vol. xxi. p. 520.; vol. xlii. p. 434.) It is imagined that the first lace ever made in this country was of the sort called *Brussels Point*, the net work made by bone bobbins on the pillow, and the pattern and sprigs worked with the needle. Such appears to have been the kind worn by the nobility and people of high rank, as is evident by the different portraits now in existence, painted by Vandyke, in the time of Charles I., and afterwards by Sir Peter Lely and Sir Godfrey Kneller, in the succeeding reigns of Charles II., Queen Anne, and George I. About a century since, the *grounds* in use were the old Mechlin, and what the trade termed the *wire ground*, which was very similar, if not identical, with the *modern* Mechlin, the principal article in the present French manufacture. The laces made in these grounds were singularly rich and durable: the designs of the *old Mechlin* resembled the figures commonly introduced in ornamental carving. Between 70 and 80 years ago, a great deterioration was occasioned by the introduction of the *Trolly* ground, which was exceedingly coarse and vulgar, the figures angular, and altogether in the worse taste conceivable. An improvement, however, took place about the year 1770, when the ground, which is probably the most ancient known, was re-introduced; this was no other than the one still in partial use, and denominated the *old French ground*. About 1777, or 1778, quite a *new* ground was attempted by the inhabitants of Buckingham and its neighbourhood, which quickly superseded all the others; this was the *point ground*, which had (as is supposed) been imported from the Netherlands. From the first appearance of this ground may be dated the origin of the modern pillow-lace trade; but it was not until the beginning of the present century that the most striking improvements were made; for during the last quarter of the eighteenth century, the article, though certainly much more light and elegant from the construction of the ground, was miserably poor and spiritless in the design. Soon after the year 1800, a freer and bolder style was adopted; and from that time to 1812, the improvement and consequent success were astonishing and unprecedented. At Honiton, in Devon, the manufacture had arrived at that perfection, was so tasteful in the design, and so delicate and beautiful in the workmanship, as not to be excelled even by the best specimens of Brussels lace. During the late war, veils of this lace were sold in London at from 20 to 100 guineas; they are now sold at from 8 to 15 guineas. The effects of the competition of machinery, however, were about this time felt; and in 1815, the broad laces began to be superseded by the new manufacture. The pillow-lace trade has since been gradually dwindling into insignificance, compared with its condition 30 years back. It is difficult to form an estimate of the number of persons employed in pillow-lace making during its prosperity; but in a petition from the makers in Buckingham and the neighbourhood, presented to her late Majesty in 1830, it was stated that 120,000 persons were dependent on the trade; but this number has since been very greatly diminished.

Nottingham Lace.—A frame-work knitter of Nottingham, named Hammond, about the year 1768, was the first who made lace by machinery. Though dissipated and destitute of money, employment, or credit, the idea struck him, while looking at the broad lace on his wife's cap, that he could fabricate a similar article by means of his stocking frame.—(*Gravenor Henson on Hosiery, Lace, &c.* p. 295.) He tried, and succeeded. The first machine ostensibly for lace (introduced at Nottingham about the same

period), was called a pin machine, for making single press *point net* in imitation of the Brussels ground. This machine, although lost here, is still used in France in manufacturing the net called *tulle*. This was the age of experiments; and workmen at their leisure hours employed themselves in forming new meshes on the hand, in the hope of perfecting a complete hexagon, which had hitherto eluded all their efforts to discover. In 1782, the warp frame was introduced, which is still in use for making *warp lace*; and in 1799 it was first attempted to make *bobbin net* by machinery; but this was not found to answer. During the succeeding 10 years many alterations were made in the construction of the machines, with no better success, until at length, in 1809, Mr. Heathcoat of Tiverton succeeded in discovering the correct principle of the bobbin-net frame, and obtained a patent for 14 years for his invention. Steam power was first introduced by Mr. John Lindley, in 1815–16; but did not come into active operation till 1820. It became general in 1822–23; and a great stimulus was at this period given to the trade, owing to the expiration of Mr. Heathcoat's patent, the increased application of power, and the perfection to which the different hand frames had by this time been brought. A temporary prosperity shone on the trade; and numerous individuals — clergymen, lawyers, doctors, and others — readily embarked capital in so tempting a speculation. Prices fell in proportion as production increased; but the demand was immense; and the Nottingham lace frame became the organ of general supply, — rivalling and supplanting, in plain nets, the most finished productions of France and the Netherlands.

Bobbin Net Manufacture. — In the last edition of this work, it was estimated that in 1843 there were employed in the production of machine lace, 4,000 hands, receiving 165,000*l.* in wages — that the trade was confined to about 15 houses in Nottingham and the neighbourhood, and that the "estimated total value of the bobbin net and warp lace trade amounted to 2,740,000*l.*" A remarkable advance has taken place since that period, owing to the improvements which have been made in the machinery. In an admirable paper on the history of this manufacture, read by Mr. William Felkin, of Nottingham (a most competent authority), before the Society of Arts, and published in their Journal for May 1856, he says, — "The æra of ornamenting lace upon the machine has certainly been ushered in — the results are now startling and of incalculable importance. Every fancy article, from the narrow lace edging to the two-yard wide store curtain, requiring some thousands of yards to complete the design, are now as much familiarised to our mechanicians, designers and workpeople, as they were twenty years ago unthought of or unknown." Nothing can establish more conclusively the benefit which has resulted to the trade, owing to the improvements in the machinery, than the periodical reduction which has taken place in the price of the square yard. Mr. Felkin says — "The second patented machine was a complex one; it required 60 motions to the formation of a mesh. A workman in one of these machines, 36 inches in width, could produce 1000 meshes a minute. The motions have gradually been reduced to *six*, — and a machine 5 yards wide will turn off 40,000 meshes per minute with ease. The first finished pieces were sold at 100*s.* the square yard; in 1813, 40*s.*; in 1815, 30*s.*; 1818, 20*s.*; 1821, 12*s.*; 1824, 8*s.*; 1827, 4*s.*; 1830, 2*s.*; 1833, 1*s.* 4*d.*; 1836, 10*d.*; 1842, 6*d.*; 1850, 4*d.*; 1856, 6*d.*; the last is about a natural average price." These reductions, however, have been greatly promoted by the improvements simultaneously made in the spinning of fine yarns. In 1810, No. 220 doubled yarn was worth 100*s.* per lb.; in 1856, only 10*s.* per lb.; and No. 240 in 1810 brought 140*s.*, while in 1856 its selling price was 13*s.* only. Mr. Felkin adds: —

"In 1831 embroidering and finishing of lace employed wholly, or in part, about 150,000 hands. They received wages 1,500,000*l.* in the year. This fell, in 1833, to 550,000*l.*, and 55,000 hands; and, in 1836, to 350,000*l.*, and 35,000 hands. Including wages at the machines, as well as the subsequent processes, there has been paid to at least 130,000 hands in 1856, 2,200,000*l.* in wages alone, in this department of the Nottingham lace trade.

"In conclusion, the manufacture of bobbin-net lace by machinery is scarcely half a century old. The following will give an approximate idea of what in this brief interval it has become in this country: —

"At several periods an account of the machines has been taken. In 1815 there were 140; 1820, 1,008; 1826, 2,469; 1831, 4,500 — making a return of 3,417,000*l.*; 1833, 5,000, returning 2,620,000*l.*; 1836, 3,800, returning 2,212,000*l.*; in 1844, 3,200, returning 2,995,000*l.* In 1851 Mr. Birkin, reporting to Section 19 of the Great Exhibition, found 3,200 (34,382 quarters width) at work, returning 2,300,000*l.*, employing about 2,965,945*l.* capital, and 133,015 hands. Capital in bobbin-net machinery alone was estimated at 1,329,445*l.*

"In 1856 the machinery is increased to 3,500 (full 40,000 quarters in width), and greater power in production in the new ones. Also a far larger proportion is employed upon silk materials, and the number of frames making fancy goods forms now far the largest proportion. These changes will serve to account for the very large increase in the returns of the trade this year beyond 1850. 1,350 machines at least are rotary circulars, making plain goods by power in factories. At least 1,050 making fancies are worked by power, probably many more. About 2,158 machines in all, partly "levers," partly circulars, some pushers, and some traverse warps, make fancy goods now. The materials are all imported, and cost on importation during the past year 920,000*l.* The returns were 3,680,000*l.*, or thereabouts. This left for wages, interest and profits, 2,760,000*l.*

"If to these figures be added the cost of materials (all imported) in the warp-lace trade, 60,000*l.*, and the ultimate returns, 360,000*l.*, the result of the operations of the entire machine-wrought English lace trade will be: — Raw materials used cost, 980,000*l.*; total returns, 4,040,000*l.*; paid in wages, interest, wear and tear, and profits, 3,060,000*l.* The entire number of hands employed may be stated at 135,000.

"The trade was, until 1850 or thereabouts, cooped up in small unsightly workshops and warehouses for the most part, but has been transferred to a large extent into some of the noblest buildings of which any manufacturing town can boast. Factories, dressing-rooms, and warehouses are all becoming spacious, airy, and, I trust, healthy; at least 250,000*l.* has been expended within the last seven years in this class of improvements."

Since 1856, when the above account of the trade was written, the wholesale houses have increased from 115 to upwards of 200; and a great many patents have been taken out for improvements in machinery for making fancy lace*, for fabrics to be produced from lace machines, for gloves, shirts, &c., and also for making gloves complete on the machines without seams. This class of machinery has gradually been increasing in Nottingham, Stoptford near Nottingham, and Melbourne in Derbyshire; and from the great variety of articles produced it is likely to go on increasing. At this time (1859) the machinery in Nottingham and its suburbs has increased by upwards of 800, making an additional amount of 4,200 quarters in width. This number would have been considerably greater, had not the panic in 1857 prevented it. At present very few machines are being built. The increase of machinery may be classed as follows — viz. 200 for making fancy lace, and 100 for plain nets. A few have been exported to France and Barcelona in Spain. The population of Nottingham and its suburbs is now about 159,000, the majority of which is employed in the lace and hosiery trades, and it is believed that the number of hands employed, as well as the amount of capital, are increased beyond Mr. Felkin's estimate, in proportion to the additional number of machines which have since been introduced. Such has been the progress in the manufacture during the last few years, that some descriptions of lace, viz. Spanish, Maltese, and Plat, are produced by machinery in such perfection, that they can scarcely be recognised from cushion-made goods. Looking, however, at the competition which exists in the trade, the manufacturers very generally complain of the anomalous position in which they are placed with respect to the French machine-made lace, which is allowed to be imported at a nominal duty,

* At this moment, a new combination, by four different machines, of an imitation of Maltese lace is produced, and sold at 7*s.* per yard, which in Paris is readily sold for 35 francs.

while the English manufacture is strictly prohibited from entering France. They complain also of the present mode of registering patents, as it prevents that easy investigation into the character of the machines, which is so essential towards their improvement.

The *Embroidery* branch of the lace trade gave employment to many thousands of females in Nottingham and London, and their neighbourhoods, and also at Coggeshall in Essex. In 1813 Mr. Felkin estimated that not less than 73,000 were employed. At the Great Exhibition in 1851 (Class XIX) a most interesting display of choice specimens of this industrial art was presented to the public, and a very able paper on the lace trade generally was contributed by the reporter of that Section (Richard Birkin, Esq., of Nottingham). There are, however, no statistics which furnish any accurate estimate of the number of persons (women and children) now engaged in that department. Owing to the great perfection to which machine-made lace has arrived, particularly since the successful introduction of the Jacquard mounting, it is understood that the embroidery branch of the trade has very greatly declined of late years, although in numerous articles of dress "*Limerick lace*" still continues to maintain its established character.

The remarkable improvements which have been gradually introduced into the manufacture of machine-made lace, have seriously interfered with the *pillow lace* trade—and many thousands of women and children in the counties of Bedford and Buckingham are now finding a better reward for their labour in straw plaiting. This applies, however, rather to the *narrow* hand-made lace than to the highest description of this industrial art, which continue in great favour with the fashionable classes. At the Great Exhibition in 1851 specimens of Honiton lace (the most tasteful and flourishing of the British pillow-lace production) were exhibited in flouncings, shawls, scarfs, handkerchiefs, berthes, and a variety of other articles, varying in price from 10 to 200 guineas each; and there is a strong feeling, from the refinement displayed in the production of elegant designs in this department, that it will continue to hold its ground notwithstanding the remarkable improvements in machinery, which from its low price brings it within the demand of the lower classes,—as, like works of high art, it is recognised by the higher classes as the work of a master.* It is the *original* picture and not the *copy*, and is consequently held in highest estimation. But although on the whole the fabrication of *pillow lace* has unquestionably fallen off, a new department of a kindred nature has sprung up, which has given employment to many thousands of women and children in the United Kingdom, but especially in Ireland. A description of lace termed "*crochet work*," has been introduced to a great extent of late years, and has been taught very generally in the industrial schools, both in the south and north of Ireland. The famine of 1847 directed the attention of humane persons to the expediency of providing employment for the starving class in that country,—and this new department of industrial art is now pursued there to a great extent. At the present time it is believed that not less than 250,000 women and children are engaged in that branch and in the embroidery of fine muslins, to meet the prevailing taste, not only required by our own female population, but for export to all parts of the world. The crisis in 1857, which was attended by the failure of several of the larger houses in Glasgow, engaged in the embroidered muslin trade, each of whom employed from 50,000 to 70,000 persons in the North of Ireland, led to great privations to those who were engaged in that branch,—but they are now recovering from the depression which on that occasion befel the trade.

Foreign Lace Trade.—The application of the Jacquard mounting to the bobbin-net machine has been attended with a great increase in the French manufacture, and in a very superior taste, in imitation of the most favoured "*grounds*," particularly at Calais, St. Pierre de Calais, Lyons, and Cambray. The Calais machines numbered in 1839, 705; 1844, 801; 1851, 603. Many have been replaced by wider and speedier machines. They had 3 pushers, 14 traverse warps, 124 common circulars, 141 Jacquard circulars, and 321 levers; 50,000 females are employed, besides the ordinary proportion of machine hands and attendants. There are 800 other machines at Boulogne, St. Omer, Douay, Lille, St. Quentin, Caen, and Lyons. More expensive goods are produced on French machines, than on ours; and English plain nets, which were formerly extensively smuggled into France, are now supplanted by their own. They have applied the Jacquard apparatus to their machinery with much success, and of late years have ceased to copy Nottingham patterns, turning their own taste in designs to good use and profit. There were at Brussels in 1850, 16; at Termonde, 8; at Malines, 5; at St. Josse, 4—in all 31 machines in Belgium,—chiefly making three-twist Brussels net, upon which cushion flowers are applied. In bobbin-net machinery there are probably in Switzerland, 80; in Saxony, 70; Austria, 100; Prussia and Russia, 30; in Spain and other countries, 80—altogether 360—(Felkin). Since 1856 these branches have been steadily increasing. *Embroidery work* has also considerably increased, and for some years past has extended to the departments of La Meurthe, La Moselle, La Meuse, and Des Vosges. In the latter, forming the ancient province of Lorraine, this beautiful branch of industry has arrived at great perfection. It is estimated to give employment to from 150,000 to 180,000 females, spread over more than twenty departments of France, who earn from 8*d.* to 1*s.* per day, and double that sum in Paris.—(Birkin).

Hand-made Lace may give employment to upwards of 200,000 females of all ages, who earn from 6*d.* to 1*s.* a day. It is principally carried on at Caen and Bayeux, Chantilly and neighbourhood, Lille, Arras, Mirecourt, Du Puy, Boilleul, and Alençon. The lace of Alençon is the only fabric not made on the pillow, being worked entirely with the needle. It was introduced by Colbert in 1660 from Venice and Genoa,—is the only lace made with pure linen thread (handspun)—the thread is worth from 100*l.* to 120*l.* per pound (Birkin). Some beautiful specimens of hand-made lace were exhibited from Switzerland,—and so great is now the demand for the article, that the manufacturers are forced to employ great numbers of females in the western provinces of Austria and the southern provinces of the Duchy of Baden. Perhaps 40,000 persons earn their living by the embroidery branch, first-class hands receiving 1*s.* per day, and second class from 3*d.* to 8*d.* 100,000 pairs of curtains alone are estimated to be imported into Great Britain. But the Swiss also export largely to America, Germany, Italy, Spain, and other southern countries. Specimens of lace and embroidery were also exhibited from Saxony, Spain, Hamburg, Austria, and Malta. Belgium continues to sustain its high character in the production of that beautiful art, and (with the exception of Point d'Alençon, made in the north of France), Brussels produces the most valuable known lace. Mechlin laces are made at Malines, Antwerp, and the vicinity; Valenciennes, at Ypres, Menin, Courtrai, Bruges, Ghent, and Alost. The village of Grammont is remarkable for great improvements made in white thread lace, and also in Blackpoint trimming laces. Some beautiful specimens of hand-made lace are now also imported from Madeira.

The cotton lace and patent net exported in 1857 was of the estimated value of 400,336*l.*

We are indebted for this learned and very excellent article to our friend Mr. Robert Slater, of Fore Street, London.

LACK, a word used in the East Indies to denote the sum of 100,000 rupees, which, supposing them standards, worth 2*s.* each, amounts to 10,000*l.* sterling.

LADING, BILL OF. See BILL OF LADING.

LAGAN. See FLOTSAM.

LA GUAYRA, the principal sea-port of the republic of Venezuela, in the province of Caraccas, on the Caribbean Sea, lat. 10° 36′ 19″ N., lon. 67° 6′ 45″ W. Population 8,000? In 1810; the population is believed to have amounted to 13,000; the reduction being a consequence of the loss of life caused by the tremendous earthquake of 1812,

and the massacres and proscriptions incident to the revolutionary war. The population of the city of Caraccas, of which La Guayra may be considered as the port, fell off, from the same causes, from 43,000 in 1810, to 23,000 in 1830; but they are now both increasing.

Port. — There is neither quay nor mole at La Guayra. Ships moor E. N. E. and W. S. W., with their heads to the north, at from ¼ to ¾ of a mile from the land, in from 9 to 18 fathoms. The holding ground is good; and notwithstanding the openness of the road, vessels properly found in anchors and cables run very little risk of being driven from their moorings.

Trade. — The principal articles of export are coffee, cocoa, indigo, hides, sarsaparilla, &c. The principal imports are cotton, linen, woollen and silk stuffs, with hardware and cutlery, wines, haberdashery, &c. La Guayra shares the trade of Venezuela with the ports of Cumana, Puerto Cabello, Maracaybo, &c., having about a half of its entire amount, which, however, is insignificant. In 1857, the estimated values of our imports and exports from and to Venezuela amounted, the former to only 29,505*l.*, and the latter to 377,711*l.*

Port Regulations. — On casting anchor, a visit is paid by the collector of customs, or his agent, accompanied by other officers, who take from the master his register, manifest, and muster-roll, and an officer is left on board until the cargo is discharged. The master must swear to his manifest within 24 hours after his arrival, when the permit to discharge is granted, and within 3 days all invoices must be presented. The discharge completed, the same officers repair on board to examine the vessel, and all being found in order, the officer is withdrawn. The clearing of a vessel outwards (that has entered with cargo) in ballast is then completed by paying the port charges; proof whereof being produced, the permission to sail is signed by the governor and harbour master. If the vessel take cargo on board, then the same formality, as to visiting, is pursued, as on the entry of a vessel.

Credit. — Goods imported are almost invariably sold upon credit; those exported are, on the other hand, always sold for ready money. The terms of credit vary from 2 to 6 months, or more. Bankruptcy is very rare.

Money, Weights, and Measures. — The currency of the country consists of silver money, known by the name of *macuquena*, divided into dollars of 8 reals, ½ do. of 4 reals, besides reals, ½ reals, and quartillas or ¼ reals. This money is of very unequal weight and purity, the coins issued since the commencement of the revolutionary war having been often a good deal defaced. The real should be worth 5*d.* sterling.

Weights and measures same as those of Spain.

Tares. — Real tare is taken both at the custom-house and by the merchant.

Commercial Prospects. — The commerce and industry of Venezuela suffered severely from the revolutionary struggle of which she was the theatre. But the country has been for some time past comparatively tranquil. As the riches of Venezuela consist entirely of the products of her agriculture, the legislature has wisely exerted itself to give it encouragement, by abolishing tithes, the tobacco monopoly, &c. But the want of a supply of efficient labour, arising out of the measures in progress for the abolition of slavery, is the grand obstacle to the progress of industry. The English consul at Puerto Cabello, in adverting to the deficiency of labour, in a communication dated June, 1843, says that an able-bodied man can earn enough by a day's labour to keep himself for a week; and such being the case, can any one expect industry to flourish, unless some sort of system for the supply of compulsory labour be resorted to? Indeed, the consul, though a warm advocate for the abolition of slavery, is, though not very consistently, alive to the necessity of what he calls "a mild compulsory system!" The truth is, that in countries like this, freedom and idleness are synonymous.

We have derived these details partly from *Consular Returns*, and partly from *private information*.

LAMAR, formerly COBIJA; a sea-port of the republic of Bolivia, the ci-devant Upper Peru, on the west coast of South America, lat. 22° 39′ 30″ S., long. 70° 12′ W. Population, 5,000. ?

In 1833 Lamar was declared a free port, and in it centres almost the whole direct foreign trade of the republic. Its situation is, however, very unfavourable. It labours under a great want of fresh water; and is obliged to import all its provisions by sea, either from Valparaiso, on the one hand, or from Arica on the other. The desert of Atacama lies between it and the internal and populous part of the country, where the towns of Potosi, Cochabamba, Charcas, &c. are situated. The produce imported at Lamar is conveyed across the desert on the backs of mules to the interior; the gold and silver of the mines being brought in the same way to the port to be shipped. These, with copper, saltpetre, chinchilli, skins, and wool, form the principal articles of export. Saltpetre is found in large quantities in the desert; the copper is found near the coast, and, owing to the scarcity of fuel, most part of it is exported in the shape of ore.

Peru possesses a long narrow slip of land, stretching along the coast of the Pacific from Arequipa to the Bay of Pica, which ought naturally to belong to Bolivia, being, in fact, the *littoral* of the latter. The Bolivian government has set on foot various negotiations to obtain the cession of this tract, which, besides greatly improving the frontier of the republic, would, at the same time, render her mistress of Arica, which is, in all respects, much better fitted than Lamar for becoming the entrepôt of her trade. Hitherto, however, these negotiations have proved abortive, so that, as already stated, Lamar, at present, engrosses most part of the foreign trade of the state, which, however, is but inconsiderable.

We subjoin the decree constituting Lamar a free port: —

1. From and after the 1st of July of this present year, 1833, Port Lamar shall be absolutely free and open.
2. Vessels of every nation may enter this port and remain as long as they please, without being subjected to any tax whatever, either on entrance, or during their stay, or on their departure.
3. They shall be free from all duties of anchorage, tonnage, shifting, unloading, or reloading of cargo, deposit, storage, or any other of whatever denomination.
4. Goods may be deposited in private warehouses, without any intervention on the part of the government.
5. The custom-house of Port Lamar is suppressed. In its stead will be a commissioner's office, for the purpose of distributing permits for the transportation of goods into the interior.
6. Whenever goods are to be sent into the interior, they must first be submitted to the commissioner, together with the invoice corresponding.
7. The commissioner will register them in a book, together with their valuation made by two merchants of the place, and the names of their owners, of the person to whom, and the place where they are to be sent. This is to be signed by the person entering the goods, who at the same time binds himself to have them transported direct to the custom-house for which they are destined, without opening any of the cases, bags, or other envelopes, each of which shall be sealed, marked, and numbered before departure. These points are to be expressed in the permit.
8. The commissioner shall by the earliest post send a notice to the collector of the custom-house for which any merchandise is destined, specifying the numbers, characters, quantities, and qualities of the several articles.
9. The goods must not be carried by any unaccustomed roads, but only through Calama and the public thoroughfares: and whenever they pass through any place at which a guard or commissioner is stationed, the permits must be exhibited, in order that their arrival with their seals unbroken may be ascertained.
10. Merchants, either in person or by a representative, must produce to the commissioner of the port a certificate of the delivery of the goods at the custom-house for which they are destined within 6 months from the day of their entry; in case they do not, they must at the end of that period pay the whole of the duties on them.
11. From and after the 1st of July, 1833, all goods entered at Port Lamar shall pay a duty of only 5 per cent. over and above that of half per cent. to the consulado.
12. The duty of 5 per cent. shall be paid thus: at the port, 2 per cent. on the valuation made as aforesaid; and the other 3 at the custom-house in the interior for which the goods are destined. In each case one half at the end of 3, the other half at the end of 5 months.
13. All goods carried from Port Lamar by land to any of the adjoining republics shall only pay a transit duty of 2 per cent.
14. A duty of 2 per cent. shall be paid on three-fourths of all

gold and silver money entered at any of the custom-houses in the interior for exportation through Port Lamar.

15. It is absolutely prohibited to export gold or silver, in bullion or plate, except in small quantities for the use of the person carrying it out. It will be seized wherever it is found on this side the districts of San Antonio, San Vincente, Atoca, Agua, de Castilla, Lequepate, or the line of the canal.

16. All hardware for agriculture and mining, machinery, instruments of science or the arts, iron, steel, quicksilver, and moral books, may be introduced free of duty into the republic, and productions of Bolivia may be exported likewise free.

17. A premium of 2 per cent. on their value shall be allowed on the exportation through Port Lamar of cascarilla, wool, tin, cocoa, and coffee, in the shape of remission from duties to the amount on goods carried into the interior from the same port.

The remaining articles of the decree are of a purely local nature.

LAMB-SKINS (Ger. *Lammsfelle;* Fr. *Peaux d'agneaux;* It. *Pelli agnelline;* Sp. *Pielles de corderos*). The value of lamb-skins varies according to the fineness, brilliancy, and colour of the wool. Black lamb-skins are more generally esteemed than those of any other colour. English lamb-skins are seldom to be met with perfectly black; but since the introduction of Merino sheep into this country, many of the white fleeces have, in point of quality, arrived at a pitch of perfection which justly entitles them to be ranked with some of the best fleeces in Spain. The importation of lamb-skins is immense. The great bulk are supplied by Italy. Thus of 1,600,308 undressed skins imported in 1857, no fewer than 1,303,185 were from Italy, and mostly from Tuscany. They are mostly used in the glove manufacture.

LAMP (Ger. *Lampe;* Fr. *Lampe;* It. *Lucerna;* Sp. *Lampara;* Rus. *Lampadu*), an instrument used for the combustion of liquid inflammable bodies, for the purpose of producing artificial light.

It is unnecessary to give any description of instruments that are so well known. We may, however, remark that the discovery of Sir H. Davy, who, by covering the flame with wire gauze, succeeded in producing a lamp that may be securely used in coal mines charged with inflammable gas, is one of the most ingenious and valuable that has ever been made. The following extracts from a communication of the late Mr. Buddle, an able and well-informed coal engineer, evince the great importance of Sir Humphry Davy's invention.

"Besides the facilities afforded by this invention to the working of coal mines abounding in fire damp, it has enabled the directors and superintendents to ascertain, with the utmost precision and expedition, both the presence, the quantity, and correct situation of the gas. Instead of creeping inch by inch with a candle, as is usual, along the galleries of a mine suspected to contain fire damp, in order to ascertain its presence, we walk firmly on with the safe lamps, and, with the utmost confidence, prove the actual state of the mine. By observing attentively the several appearances upon the flame of the lamp, in an examination of this kind, the cause of accidents which happened to the most experienced and cautious miners is completely developed; and this has hitherto been in a great measure matter of mere conjecture.

"It is not necessary that I should enlarge upon the national advantages which must necessarily result from an invention calculated to prolong our supply of mineral coal, because I think them obvious to every reflecting mind; but I cannot conclude without expressing my highest sentiments of admiration for those talents which have developed the properties, and controlled the power, of one of the most dangerous elements which human enterprise has hitherto had to encounter."

LAMP-BLACK (Ger. *Kienruss;* Fr. *Noir de fumée; Nero di fumo, Negro-fumo; Negro de humo*). "The finest lamp-black is produced by collecting the smoke from a lamp with a long wick, which supplies more oil than can be perfectly consumed, or by suffering the flame to play against a metallic cover, which impedes the combustion, not only by conducting off part of the heat, but by obstructing the current of air. Lamp-black, however, is prepared in a much cheaper way for the demands of trade. The dregs which remain after the eliquation of pitch, or else small pieces of fir wood, are burned in furnaces of a peculiar construction, the smoke of which is made to pass through a long horizontal flue, terminating in a close boarded chamber. The roof of this chamber is made of coarse cloth, through which the current of air escapes, while the soot remains." — (*Ure's Dictionary of Chemistry.*)

LAND-WAITER, an officer of the Custom-house, whose duty it is, upon landing any merchandise, to taste, weigh, measure, or otherwise examine the various articles, &c., and to take an account of the same. They are likewise styled searchers, and are to attend, and join with, the patent searchers, in execution of all cockets for the shipping of goods to be exported to foreign parts; and, in cases where drawbacks or bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent searchers, are to certify the shipping thereof on the debentures.

LAPIS LAZULI. See ULTRAMARINE.

LAST, an uncertain quantity, varying in different countries, and with respect to different articles. Generally, however, a last is estimated at 4,000 or 6,000 lbs.; but there are great discrepancies.

The following quantities of different articles make a last, viz. — 14 barrels of pitch, tar, or ashes; 12 dozen of hides or skins; 12 barrels of cod-fish, potash, or meal; 20 cades, each of 1,000 herrings, every 1,000 ten hundred, and every 100 five score; 10½ quarters of cole-seed; 10 quarters of corn or rape-seed. In some parts of England, 21 quarters of corn go to a last; 12 sacks of wool; 20 dickers (every dicker 12 skins) of leather; 18 barrels of unpacked herrings; 10,000 pilchards; 24 barrels (each barrel containing 100 lbs.) of gunpowder; 1,700 lbs. of feathers or flax.

Last is sometimes used to signify the burden of a ship.

LATH, LATHS (Du. *Latten;* Fr. *Lattes;* Ger. *Latten;* It. *Correnti;* Rus. *Slegü*), long, thin, and narrow slips of wood, nailed to the rafters of a roof or ceiling, in order to sustain the covering. Laths are distinguished into various sorts, according to the different kinds of wood of which they are made, and the different purposes to which they are to be applied. They are also distinguished according to their length, into 5, 4, and 3 feet laths. Their ordinary breadth is about an inch, and their thickness ¼ of an inch. Laths are sold by the bundle, which is generally called a hundred: but 7 score, or 140, are computed in the hundred for 3 feet laths; 6 score, or 120, in such as are 4 feet; and for those which are denominated 5 feet the common hundred, or 5 score.

LATTEN, a name sometimes given to tin plates; that is, to thin plates of iron, tinned over.—(See TIN.)

LAWN (Ger. and Fr. *Linon;* It. *Linone, Rensa;* Sp. *Cambray clarin*), a sort of clear or open worked cambric, which, till of late years, was exclusively manufactured in France and Flanders. At present, the lawn manufacture is established in Scotland, and in the north of Ireland, where articles of this kind are brought to such a degree of perfection as nearly to rival the productions of the French and Flemish manufactories. In the manufacture of lawns finer flaxen thread is used than in that of cambric.

LAZARETTO. See QUARANTINE.

LEAD (Ger. *Bley, Blei;* Du. *Lood, Loot;* Fr. *Plomb;* It. *Piombo;* Sp. *Plomo;* Rus. *Swinetz;* Pol. *Ołów;* Lat. *Plumbum;* Arab. *Anuk;* Hind. *Sisa;* Pers. *Surb*), one of the most useful metals. It is of a bluish white colour, and when newly melted is very bright, but it soon becomes tarnished by exposure to the air. It has scarcely any taste, but emits, on friction, a peculiar smell. It stains paper or the fingers of a bluish colour. When taken internally it acts as a poison. It is one of the softest of the metals; its specific gravity is 11·35. It is very malleable, and may be reduced to thin plates by the hammer; it may also be drawn out into wire, but its ductility is not very great. Its tenacity is so small that a lead wire $\frac{1}{128}$ inch diameter is capable of supporting only 18·4 lbs. without breaking. It melts at 612°.—(*Thomson's Chemistry.*)

Lead is a metal of much importance in the arts. Its durability and malleability make it very suitable for the roofing of buildings, the construction of gutters and such like purposes. It used to be very extensively employed in the formation of water-pipes and cisterns. But though water has no direct action on lead, it facilitates the action of the external air; and hence the lead of cisterns and of pipes from which the air is not entirely excluded becomes oxidised, and is covered with a white crust at the point where the surface of the water comes into contact with the air. Inasmuch, however, as this oxide is extremely deleterious, lead pipes and cisterns are now very generally superseded by those of cast iron. At present, perhaps, lead is more extensively used in the manufacture of small shot than in any other way. Its salts, though poisonous, are used in medicine to form sedative external applications; and frequently not a little, by the disreputable wine merchant, to stop the progress of acetous fermentation. Wine thus poisoned may, however, be readily distinguished; a small quantity of the bicarbonate of potass producing a white precipitate, and sulphuretted hydrogen a black one. Pure wine will not be affected by either of these tests. "The oxide of lead enters into the composition of white glass, which it renders clearer and more fusible: it is also used in glazing common earthen vessels; hence the reason that pickles kept in common red pans become poisonous. Lead, with tin, and a small quantity of some of the other metals, forms pewter; with antimony, it forms the alloy of which printing types are made."—*Joyce's Chem.* (*Mineralogy.*)

Mines of this valuable mineral have been wrought in England from the æra of the Romans. It does not, however, appear that it was obtained anywhere except in Derbyshire, till 1289, when it was discovered in Wales; and the fact that silver was found intermixed with the Welsh ores having transpired, gave a new stimulus to the business; but in other respects the discovery of silver was of no use; the quantity obtained being insufficient to defray the cost of its separation from the lead. At present, the most productive English lead mines are situated in Allendale, and other western parts of Northumberland; at Aldstone Moor, &c., in Cumberland; in the western parts of Durham; in Swaledale, Arkendale, and other parts of Yorkshire; in the hundred of High Peak in Derbyshire, in Salop, and in Cornwall. The Welsh mines are principally situated in the counties of Flint, Cardigan, and Montgomery; those of Scotland in Ayr, Kirkcudbright, and Lanark; and those of Ireland, in Wicklow, Down, and Limerick. Lead mines are also wrought to considerable advantage in the Isle of Man. We subjoin an abstract deduced from the accounts furnished by the Museum of Practical Geology, of the

Quantities of Lead, Lead Ore, and Silver produced in the U. Kingdom in 1857.

	Lead.		Lead Ore.		Silver.
	tons	*cwts.*	*tons*	*cwts.*	*ounces.*
England	48,308	10	68,453	2	417,543
Wales	16,124	3	21,455	3	60,097
Scotland	1,351	4	1,890	9	4,206
Ireland	1,407	3	2,298	19	3,071
Isle of Man	2,027	15	2,656	0	48,016
Uncertain origin	48		67		133
Totals	69,266	15	96,820	18	532,866

In 1857, 12,678 tons of lead were imported, and 22,637 tons (inc. 240 tons foreign) were exported. It consequently follows that the produce of our own mines is sufficient not only to supply the home demand, but to furnish a surplus of 9,629 tons for exportation. Pig lead was worth, in the London market, in April, 1859, 23*l.* a ton. In 1832 it was only worth 13*l.* 10*s.* a ton.

Account of the Real Value of the Lead exported from the U. Kingdom in each of the 3 Years ending with 1858.

	1856.	1857.	1858.
Lead and shot	£582,269	£549,525	£459,952
Lead, red	50,081	66,402	59,314
Lead, white	78,263	81,176	76,681
Totals	£710,613	£697,101	£595,947

Russia, the British East Indies, the U. States, China, Australia, &c., are the marts to which our exports of lead are principally exported.

Lead, when first extracted from its ore, always contains a certain portion of silver, varying from a few grains to 45 oz. or more in the ton. When the silver mixed up with the lead is sufficient to repay the expense, it is usual to separate it, which is effected by the process termed *refining*. The lead of some of the English mines, especially those of Cornwall, and, also, of the Isle of Man, contains very considerable quantities of silver, and our readers will, perhaps, be surprised to learn that it has been estimated by the highest authority that, in 1857, the U. Kingdom furnished no fewer than 532,866 oz. of silver, worth, at 5*s.* an oz., 132,216*l.* 10s., obtained from lead.—(*Statement compiled by Robert Hunt, Esq., of the Museum of Practical Geology.*)

Of 12,768 tons lead imported in 1857, Spain sent us 11,343 tons. The lead mines of Granada would, in truth, were they properly wrought, be among the most productive in the world. And as it is, lead is, next to wine and wool, the most important article which Spain has to offer in exchange for foreign products. In 1851, for example, the value of the exports of wool from Spain was estimated at 45,428,491 reals, and that of the exports of lead at 43,888,370 do.

The consumption of lead in France has greatly increased within the last 20 years. In 1852, about 30,000 tons of ore were imported, of which from 8-10ths to 9-10ths were brought from Spain.

The lead mines of the U. States are principally situated in Illinois and Wisconsin, on the Upper Mississippi. Their produce and that of the other mines in the Union may, perhaps, amount to from 18,000 to 20,000 tons a year.

LEAD, BLACK, OR PLUMBAGO. See BLACK LEAD.

LEAD, RED, OR MINIUM. See MINIUM.

LEAGUE, a measure of length, containing more or fewer geometrical paces, according to the customs of different countries.—(See WEIGHTS AND MEASURES.)

LEAKAGE, in commerce, an allowance in the customs, granted to importers of wine, for the waste and damage the goods are supposed to receive by keeping.—(See *Warehousing Act*, in Art. WAREHOUSING SYSTEM.)

LEATHER (Ger. *Leder*; Du. *Leder, Leêr*; Da. *Læder*; Sw. *Läder*; Fr. *Cuir*; It. *Cuojo*; Sp. *Cuero*; Rus. *Kosha*; Lat. *Corium*), the skins of various quadrupeds, dressed in a particular manner for the use of manufacturers, whose business it is to make them up, according to their different employments.

The leather manufacture of Great Britain is of very great importance, and ranks either third or fourth on the list; being inferior only in point of value and extent to those of cotton, wool, and iron, if it be not superior to the latter. Sir F. M. Eden, in his work on *Insurance*, estimated the value of the different articles manufactured of leather, in 1803, at 12,000,000*l.*; and there is reason to think that this statement was not very wide of the mark. The total quantity of all sorts of leather tanned, tawed, dressed, and curried, in Great Britain, may at present (1859) be estimated at about 80,000,000 lbs.; which, at 1*s.* 6*d.* per lb., gives 6,000,000*l.* as the value of the leather only. Now, supposing, as is sometimes done, the value of the leather to amount to *one third* part of the value of the finished articles produced from it, that would show the value of the manufacture to be about 18,000,000*l.*: but if, as others contend, the value of the leather does not exceed *one fourth* part of the value of the finished articles, then

the value of the manufacture would amount to 24,000,000*l.* We, however, are inclined to think that we shall be nearer the truth if we take the smaller sum, and estimate the value of the manufacture at 18,000,000*l.* To get the number of persons employed, we have first to deduct from this sum, 6,000,000*l.* for the material, which leaves 12,000,000*l.* as the aggregate amount of profits, wages, &c. And setting aside 33⅓ per cent. as profit, rent of workshops, compensation for capital wasted, &c., we have a sum of 8,000,000*l.* remaining as wages: and supposing those employed as shoemakers, saddlers, glovers, &c. to make at an average 35*l.* a year each, the entire number of such persons will amount to 228,000.

This, however, does not give the total number of persons employed in the leather trade, inasmuch as it excludes the tanners, curriers, &c. employed in dressing and preparing the leather. But if, from the value of the prepared leather, 6,000,000*l.*, we deduct 2,000,000*l.* for the value of the hides, and 2,500,000*l.* for tanners' and curriers' profits, including the expense of lime, bark, pits, &c., we shall have 1,500,000*l.* left as wages. Now, as the wages of tanners, curriers, leather dressers, &c. may, we believe, be taken at 50*l.* a year at an average, we shall have 30,000 as the number employed in these departments. And adding these to the persons employed in manufacturing the leather, we have a grand total of 258,000 persons employed in the various departments of the business.

Those who may be inclined to suspect these estimates of exaggeration, would do well to reflect on the value of the shoes annually manufactured. It is generally supposed that the expenditure upon shoes may be taken, at an average of the whole population, at 10*s.* each individual, young and old; which, supposing the population to amount to 23,000,000, would give, 11,500,000*l.* for the value of shoes only; but taking the value of the shoes at only 8*s.* each individual, it gives 10,200,000*l.* for the amount. Mr. Stevenson (art. *England, Edin. Ency.*) supposes that the value of the saddlery, harness, gloves, &c. may be assumed to be at least equal to that of the shoes; but we believe this is much too high, and that it cannot be fairly estimated at above 5,000,000*l.* or 5,500,000*l.*, which leaves about 2,000,000*l.* for the value of the exports. In estimating the value of the entire manufacture at 18,000,000*l.*, or 18,500,000*l.*, we incline to think that we are as near the mark as it is easy to come in such investigations.

In speaking of the leather manufacture, Dr. Campbell has the following striking observations:—"If we look abroad on the instruments of husbandry, on the implements used in most mechanic trades, on the structure of a multitude of engines and machines; or if we contemplate at home the necessary parts of our clothing—breeches, shoes, boots, gloves—or the furniture of our houses, the books on our shelves, the harness of our horses, and even the substance of our carriages; what do we see but instances of human industry exerted upon leather? What an aptitude has this single material in a variety of circumstances for the relief of our necessities, and supplying conveniences in every state and stage of life? Without it, or even without it in the plenty we have it, to what difficulties should we be exposed?"—(*Political State of Great Britain*, vol. ii. p. 176.)

ç Leather was long subject to a duty; the manufacture being, in consequence, necessarily conducted under the *surveillance* of the excise. In 1812, the duty, which had previously amounted to 1¼*d.* per lb., was doubled; and continued at 3*d.* per lb. till July, 1822, when it was again reduced to 1½*d.* per lb. The reduced duty produced a nett revenue of about 360,000*l.* It is clear, however, that either the duty ought not to have been reduced in 1822, or that it ought to have been totally repealed. The continuance of any part of the duty rendered it necessary to continue all the vexatious regulations required to insure the collection of the revenue, while the reduction of 1½*d.* in the cost of preparing a pound of leather was so trifling as hardly to be sensible. It is, however, unnecessary to enter into any discussion to show the extreme inexpediency of laying any duty on an article so indispensable to the labouring class, and to the prosecution of many branches of industry, as leather; and still less to show the inexpediency of subjecting so very important and valuable a manufacture to a vexatious system of revenue laws, for the sake of only 360,000*l.* a year. Luckily, however, these have become matters of history. The leather duties were totally abolished in 1830; and as the manufacture has since been relieved from every sort of trammel and restraint, it has rapidly increased. It is to be hoped that no future necessity may arise to occasion the reimposition of the leather duty.

Account of the Number of Pounds' Weight of Leather charged with Duties of Excise in England, in 1824—1829.

1824	-	53,429,539	1826	-	44,927,216	1828	-	50,233,689
1825	-	52,274,957	1827	-	47,616,316	1829	-	46,200,843

The quantity annually charged with duty in Scotland during the same period was, at an average, about 6,000,000 lbs. We subjoin

An Account of the Real Value of the Leather exported from the U. Kingdom, in each of the 3 Years ending with 1858.

	1856.	1857.	1858.
Leather: wrought and unwrought	£1,493,209	£1,991,875	£1,690,873
Saddlery and harness	263,242	297,613	322,043
Totals	£1,756,451	£2,289,488	£2,012,916

Australia is by far the most extensive market for our exports of leather; and next to it, but at a great distance, are the Cape Colony, B. N. America, the W. Indies, Brazil, &c.

LEDGER, the principal book of accounts kept by merchants and tradesmen, wherein every person's account is placed by itself, after being extracted from the Journal.—(See Book-Keeping.)

LEECH FISHERY. The demand for the medicinal leech (*Hirudo medicinalis*) is so great as to afford employment to a considerable number of persons in catching and selling the animal. It is common throughout Europe, America, and India, inhabiting lakes and pools. Norfolk supplies the greater part of the leeches brought to the London market; but some are taken in Kent, Suffolk, Essex, and Wales; and large quantities are imported from Bordeaux and Lisbon. They are caught in spring and autumn, by people who wade into the pools and allow them to fasten on their limbs; or more generally the catchers beat, as they wade in, the surface of the water with poles, which sets the leeches in motion, and brings them to the surface; when they are taken with the hand and put into bags. As they come to the surface just before a thunder storm, this is regarded a good time for collecting them.—(*Thomson's Dispensatory.*)

We extract from the *Gazette des Hopitaux* the following interesting account of the fishery of leeches at La Brenne, in France:—

"The country about La Brenne is, perhaps, the most uninteresting in France. The people are miserable looking, the cattle wretched, the fish just as bad—but the leeches are admirable.

"If ever you pass through La Brenne, you will see a man, pale and straight haired, with a woollen cap on his head, and his legs and arms naked; he walks along the borders of a marsh, among the spots left dry by the surrounding waters, but particularly wherever the vegetation seems to preserve the subjacent soil undisturbed: this man is a leech fisher. To see him from a distance,—his woe-begone aspect—his hollow eyes—his livid lips—his singular gestures,—you would take him for a patient who had left his sick bed in a fit of delirium. If you observe him every now and then raising his legs, and examining them one after the other, you might suppose him a fool; but he is an intelligent leech fisher. The leeches attach themselves to his legs and feet as he moves among their haunts; he feels their presence from their bite, and gathers them as they cluster about the roots of the bulrushes and sea weeds, or beneath the stones covered with green and gluey moss. Some repose on the mud, while others swim about; but so slowly, that they are easily gathered with the hand. In a favourable season, it is possible, in the course of 3 or 4 hours to stow 10 or 12 dozen of them in the little bag which the gatherer carries on his shoulder. Sometimes you will see the leech fisher armed with a kind of spear or harpoon; with this he deposits pieces of decayed animal matter in places frequented by the leeches; they soon gather round the prey, and are presently themselves gathered into a little vessel half full of water. Such is the leech fishery in spring.

"In summer, the leech retires into deep water, and the fishers have then to strip themselves naked, and walk immersed up to the chin. Some of them have little rafts to go upon; these rafts are made of twigs and rushes, and it is no easy matter to propel them among the weeds and aquatic plants. At this season, too, the supply in the pools is scanty; the fisher can only take the few that swim within his reach, or those that get entangled in the structure of his raft.

"It is a horrid trade, in whatever way it is carried on. The leech gatherer is constantly more or less in the water, breathing fog and mist and fetid odours from the marsh; he is often attacked with ague, catarrhs, and rheumatism. Some indulge in strong liquors, to keep off the noxious influence, but they pay for it in the end by disorders of other kinds. But, with all its forbidding peculiarities, the leech fishery gives employment to many hands; if it be pernicious, it is also lucrative. Besides supplying all the neighbouring *pharmaciens*, great quantities are exported, and there are regular traders engaged for the purpose. Henri Chartier is one of those persons; and an important personage he is when he comes to Meobecq, or its vicinity; his arrival makes quite a fête—all are eager to greet him.

"Among the interesting particulars which I gathered in La Brenne relative to the leech trade, I may mention the following:—One of the traders—what with his own fishing and that of his children, and what with his acquisitions from the carriers, who sell quantities *second-hand*—was enabled to hoard up 17,500 leeches in the course of a few months; he kept them deposited in a place where, in one night, they all became frozen *en masse*. But the frost does not immediately kill them; they may generally be thawed into life again. They easily, indeed, bear very hard usage. I am told by one of the carriers, that he can pack them as closely as he pleases in the moist sack which he ties behind his saddle; and sometimes he stows his cloak and boots on top of the sack. The trader buys his leeches *pêle mêle*, big and little, green and black—all the same; but he afterwards sorts them for the market. Those are generally accounted the best which are of a green ground, with yellow stripes along the body."

A tract published at Paris in 1843, by M. Joseph Martin, leech merchant, contains a great variety of curious and instructive details in regard to the natural history of leeches, the trade carried on in them, and the frauds of the dealers. They are, we believe, much more extensively used in medical practice in France than in England; and, at all events, their consumption in the former seems to be quite immense. Notwithstanding the exhaustion of some of the marshes and ponds in different parts of the country, whence supplies of leeches were formerly procured, great numbers are still obtained at home. By far the larger portion of the necessary supplies is, however, brought from abroad; principally from Germany, Spain, Sardinia, Turkey in Europe, Algiers, Asia Minor, &c. In the French Custom-house

the imports are estimated at 500 leeches per kilog.; but M. Martin affirms that 1000 leeches do not, at an average, weigh more than a kilog. Hence the numbers and values of the leeches imported into France during each of the 5 years ending with 1847, will be,

(*French Official Returns.*)

LEGHORN, a city and sea-port of Italy, in Tuscany, lat. 43° 33′ 5″ N., lon. 10° 16¾′ E. Population, in 1858, 114,081.

Harbour, Road, &c.—Leghorn has an outer harbour, protected by a fine mole, running in a N. N. W. direction upwards of ½ a mile into the sea, and a small inner harbour or basin. The water in the harbour is rather shallow, varying from 8 feet in the inner basin to 18 or 19 feet at the end of the mole. The rise of the tides is about 14 inches. Ships lie within the mole with their sterns made fast to it by a cable, and an anchor out ahead. The light-house is built on a rock a little to the S. W. of the mole. It is a conspicuous object, being about 170 feet above the level of the sea. The roadstead lies W. N. W. of the harbour, between it and the Melora bank. The latter is a sand, lying N. and S., 4 miles in length by 2 in breadth, the side nearest the shore being about 4 miles from it. It consists, for the most part, of sand and mud, and has from 3 fathoms to ½ do. water over it; but towards its southern extremity it is rocky; and there, on some of the points which project above the water, the Melora tower has been constructed to serve as a sea-mark; it bears from the light-house W. ¼ N., distant about 4 miles. The best course for entering the roads is to keep to the northward of the Melora bank at about a mile from it, and then, having doubled it, to stand on for the light-house about 2½ miles, anchoring in from 7 to 9 fathoms, the light-house bearing S.S.E. ½ E. 4 miles off. The entrance by the channel to the south of the Melora bank is also quite safe; but it is not so suitable for large ships as that by the north. During southerly winds there is sometimes a heavy sea in the roads, but the holding ground is good; and with sufficient anchors and cables, and ordinary precaution, there is no danger. The lazaretto lies to the south, about 1 mile from the tower, and is said to be one of the best in Europe.

Trade, &c.—The comparative security and freedom which foreigners have long enjoyed in Tuscany, still more than its advantageous situation, render Leghorn the greatest commercial city of Italy. Its exports are similar to those from the other Italian ports; consisting principally of raw and manufactured silks, olive oil, borax, fruits, shumac, valonia, wines, rags, brimstone, cheese, marble, argol, anchovies, manna, juniper berries, hemp, skins, cork, &c. Leghorn platting for straw hats is the finest in the world; and large quantities are imported into Britain.—(See HATS, STRAW.) Besides the above, all sorts of articles the produce of the Levant may be had at Leghorn. Recently, however, this trade has fallen off; the English and other nations who used to import Levant produce at second hand from Italy, preferring now, at least for the most part, to bring it direct from Smyrna, Alexandria, &c. The imports are exceedingly numerous and valuable, comprising all sorts of commodities, with the exception of those produced by Italy. Sugar, coffee, and all sorts of colonial produce; cotton stuffs, yarn, and wool; corn, woollen stuffs, spices, dried fish, indigo, dye woods, rice, iron, tin, hides, &c.; are among the most prominent articles. Ships with corn on board may unload within the limits of the lazaretto, without being detained to perform quarantine; a circumstance which has contributed to make Leghorn one of the principal *depôts* for the wheat of the Black Sea. Hard wheat, particularly from Taganrog, is in high estimation here and in the other Italian ports. It is particularly well fitted for making vermicelli, maccaroni, &c. The government do not publish any official account of the imports and exports of Leghorn; and no mercantile circulars that we have been fortunate enough to fall in with, supply the deficiency.

Money.—Down to 1837 accounts were generally kept in *pezze da otto reali* (or dollars of 8 reali), the pezza being divided into 20 soldi or 240 denari; but this money has been discontinued since the above date, and accounts are now kept *in lire Toscane*. The lire of 100 centesimi is worth 7·82*d.*; so that the par of exchange with London is 30·69 lire per *l.* The lira is divided in 20 soldi di lira each of 5 centesimi.—(*Pratt's Cambist*, p. 57.)

Weights and Measures.—The pound by which gold and silver and all sorts of merchandise are weighed is divided into 12 ounces, 96 drachms, 288 denari, and 6,912 grani. It is =339·542 French grammes, or 5,240 English grains. Hence 100 lbs. of Leghorn=74·864 lbs. avoirdupois; but in mercantile calculations it is usual to reckon 100 lbs. of Leghorn =77 lbs. avoirdupois: this, perhaps, has arisen from taking the tares and other allowances, as to which there is a good deal of uncertainty, into account. Thus it is found that the English cwt. seldom renders more than 140 or 142 lbs. at Leghorn, though it is =160 lbs.; in the instances of logwood, tobacco and a few others, it does not render more than 155 lbs. The quintal, or centinaio = 100 lbs. The cantaro is generally 150 lbs.; but a cantaro of sugar = 151 lbs.; that of oil = 88 lbs.; of brandy = 120 lbs.; of stock-fish, and some other articles = 160 lbs. The rotolo = 3 lbs.

Corn is sold by the sacco or sack; = 2·0739 Winch. bushels; hence 4 sacks = 1 Imperial quarter very nearly.

The liquid measures are—

2 Mezzette = 1 Boccale.
2 Boccale = 1 Fiasco.
20 Fiaschi = 1 Barile = 12 English wine gallons.

The barile of oil is 16 fiaschi, of two boccali each, = 8·83 wine gallons; it weighs about 60 lbs. avoirdupois. A large jar of oil contains 30 gallons; a small one 15; and a box with 30 bottles = 4 gallons.

The long measure is the braccio, which is divided into 20 soldi, 60 quattrini, or 240 denari; it contains 22·98 English inches. 85·5 braccia = 100 English yards. The canna of 4 braccia = 92 English inches.

Credit, Charges, &c.—Goods in general are bought and sold for silver money; between which, and the money in which bills of exchange are bought, there is a difference of 7 per cent. (agio) against silver; *i. e.* 107 dollars in silver are equal to 100 in gold.

On goods bought or sold (unless it be in effective money, where there is no discount) there is, generally speaking, a discount of 3 per cent.; on all cotton manufactures, 4 per cent.

Charges on sales, including commission, are generally from 6 to 8 per cent.; on fish, 8 or 10 per cent.

Taxes. Cinnamon lb. 12 to 14 per ½ bale; Moka coffee, 5 to 7 per cent.; indigo serdons, lb. 20, 30 to 40 per seron; sugar Havannah, 14 per cent.; crushed, 12 per cent. or real tare of package; loaf package, and 4 per cent. for paper; Brazil of 90 inches, 18 per cent. upwards 20 per cent.; tobacco, 10 per cent.; rosin, 12 per cent. For most other articles specified in the price current the real tare is allowed.

Exchanges, Three Months' Date.—London, liv. @ per £ stg. Spanish dollars, 6*l.* 11*s.*; Paris, liv. @ per 100 francs.; doubloons, 101*l.*; Genoa, liv. @ per 100 Ln.; Trieste, liv. @ per 100 G. Flor.

In 1836 a joint-stock bank was established in Leghorn, with a capital of 2,000,000 lire (66,666*l.* sterling, taking the lira at 8*d.*) in shares of 1,000 lire each. The whole of the capital is paid up, and the responsibility is limited to the capital. The managers have the power of issuing promissory notes to the extent of 6,000,000 lire. These notes, though received by the government, are not legal tender. The operations of the bank are confined to the discounting bills of exchange not having more than four months to run, and to the purchase and sale of foreign coins. The rate of discount is fixed at 5 per cent. The superintendence is vested in a director and eight regents, nominated by the shareholders; and the government appoints a commissary and 3 censors (from among the shareholders), who exercise the highest authority, to secure obedience to the statutes. An annual report and balance sheet is produced, and is accessible to all shareholders. The maximum amount for which notes are issued is 2,000 lire=66*l.* 13*s.* 4*d.* sterling, the lowest, 200 lire=6*l.* 13*s.* 4*d.* sterling. It is a profitable establishment; its shares are at a considerable premium, and it has a fair prospect of farther success.

Straw Hats.—The most interesting, and perhaps also the most important industrial pursuit carried on in Tuscany, consists in the manufacture of straw hats and straw plaiting. The straw grown in the country is peculiarly well adapted for the purpose, and the peasantry have attained to an unrivalled degree of skill in its manipulation. The value of the exports of the article increased from 9,833,000 lire in 1851, to 23,187,000 ditto in 1855, being about 1-3rd part of the entire exports from the duchy in the course of the latter year, and we are informed that they have since continued to increase. It is said that about 1-4th part of the population of Tuscany derive their principal support from this manufacture; and though this be probably an exaggerated statement, it shows the importance of the business. Various efforts have been made in this and other countries to raise straw similar to that employed in Tuscany in the manufacture. Hitherto, however, these efforts have had but little success, and the superiority of Tuscany in this interesting branch of industry was never more conspicuous than at present.—(*Annuaire de l'Economie Politique pour* 1858, p. 501.)

In 1858, there belonged to Tuscany, and principally to Leghorn, 959 ships of the agg. burden of 59,024 tons.

LEMONS (Ger. *Limonen;* Du. *Limoenen;* Fr. *Limons, Citrons;* It. *Limoni;* Sp. *Limones;* Port. *Limões;* Rus. *Limonii;* Arab. *Lémōn*), the fruit of the lemon tree. (*Citrus medica*, var. *β.* C.)

It is a native of Assyria and Persia, whence it was brought into Europe; first to Greece, and afterwards to Italy. It is now cultivated in Spain, Portugal, and France, and is not uncommon in our greenhouses. Lemons are brought to England from Spain, Portugal, and the Azores, packed in chests, each lemon being separately rolled in paper. The Spanish lemons are most esteemed.—(For an account of the imports, see ORANGES.)

LEMON JUICE, OR CITRIC ACID (Ger. *Zitronensaft;* Fr. *Jus de limon;* It. *Agro o Sugo de' limone;* Sp. *Jugo de limon*), the liquor contained in the lemon.

It may be preserved in bottles for a considerable time by covering it with a thin stratum of oil; thus secured, great quantities of the juice are exported from Italy to different parts of the world; from Turkey also, where abundance of lemons are grown, it is a considerable article of export, particularly to Odessa. The discovery of the antiscorbutic influence of lemon juice is one of the most valuable that has ever been made. The scurvy, formerly so fatal in ships making long voyages, is now almost wholly unknown; a result that is entirely to be ascribed to the regular allowance of lemon juice served out to the men. The juice is also frequently administered as a medicine, and is extensively used in the manufacture of punch.

LEMON PEEL (Ger. *Zitronenshalen, Limonschellen;* Fr. *Lames d'écorce de citron;* It. *Scorze de' limone;* Sp. *Courtezas de citra*). The outward rind of lemons is warm, aromatic, and slightly bitter,—qualities depending on the essential oil it contains. It is turned to many uses; and when well candied, constitutes a very good preserve. In Barbadoes, a *liqueur*, known under the name of *Eau de Barbade*, is manufactured from lemon peel, which the inhabitants have the art of preserving in a manner peculiar to themselves. Both the liqueur and the conserve used to be in high repute, especially in France.

LETTER. (See POST OFFICE.)

LETTER OF CREDIT, a letter written by one merchant or correspondent to another, requesting him to credit the bearer with a certain sum of money. Advice by post should always follow the granting of a letter of credit; a duplicate of it accompanying such advice. It is prudent, also, in giving advice, to describe the bearer of the letter, with as many particulars as possible, lest it fall improperly into other hands.

LETTERS OF MARQUE AND REPRISAL, "are grantable by the law of nations, whenever the subjects of one state are oppressed and injured by those of another, and justice is denied by that state to which the oppressor belongs."—(*Chitty's Com. Law*, vol. iii. p. 604.) Before granting letters of marque, government is directed by the 5 Hen. 5. c. 7., to require that satisfaction be made to the party aggrieved; and in the event of such satisfaction not being made within a reasonable period, letters of marque and reprisal may be issued, authorising the aggrieved party to attack and seize the property of the aggressor nation, without hazard of being condemned as a robber or pirate. Such letters are now only issued to the owners or captains of privateers during war, or when war has been determined upon. They may be revoked at the pleasure of the sovereign; and when hostilities terminate, they cease to have any effect.

LICENCES, in commercial navigation. The rules and regulations to be observed in the granting of licences to ships embodied in the act 8 & 9 Vict. c. 87. given in the former edition of this work, have been repealed. The only regulation with reference to this subject in the Customs Consolidation Act of 1853, the 16 & 17 Vict. c. 107. § 201., will be found in the art. SMUGGLING.

The statute now referred to has the following clauses in regard to the licensing of agents for the transacting of business relating to the entry and clearance of ships, goods, and baggage, and of lightermen for the carriage of goods to and from importing and exporting ships:—

Treasury to appoint in what Ports Agents shall be licensed.—The Commissioners of the Treasury may by their warrant appoint and declare in what ports or places in the U. K. persons acting as agents in the entry or clearance of any ships, or of any goods or baggage, or any business relating thereto, shall be required to be duly licensed for that purpose, and may from time to time revoke such warrants or appointments, and make others in lieu thereof, when and as they may see fit; and such warrants, if they relate to ports or places in Great Britain, shall be published in the London Gazette, if to ports or places in Ireland in the Dublin Gazette, and if to ports and places in Great Britain and Ireland in both those gazettes: provided always, that the appointments already made as to London, Dublin, Dover, Folkestone, Southampton, and Shoreham shall continue as if such appointments had been made under this act, until the same shall be revoked.—§ 15.

Commissioners of Customs to grant Licences to Agents.—The Commissioners of Customs may and they are hereby authorised to grant licences, in such form and manner and to such persons as they shall think fit, to act as agents for transacting business which shall relate to the entry or clearance of any ship, or of any goods or of any baggage, in any of the ports or places in respect of which such appointments as aforesaid now are or hereafter shall be made, so long as such appointments shall remain in force, and, by order under their hands, may cancel or revoke any licence so granted to any such person for fraud or misconduct; a copy of such order stating the cause of dismissal shall be delivered to such person, or to his clerk, or left at his usual place of abode or business, but such person shall be at liberty to appeal to the Commissioners of Customs in manner provided by sections 53 and 54 of this act for an investigation and reconsideration of the case; and if no such appeal be made within 3 days after the delivery of a copy of such order, or if such order shall be confirmed, such licence shall be void; and the Commissioners of Customs on granting any such licence are hereby empowered to require bond to be given by every person to whom such licence shall be granted (not being one of the sworn brokers of the city of London, and acting as such agent in the port of London), with one sufficient surety, in the sum of 1000*l.*, for the faithful and incorrupt conduct of such person and of his clerks, acting for him, both as regards the customs and his employers; and all licences heretofore granted by the Commissioners of Customs to any persons to act as agents shall be valid until revoked, and all bonds taken for the faithful and incorrupt conduct of such persons shall remain in full force: provided always, that any person, or any persons in copartnership, may, with the approval of the Commissioners of Customs, appoint a clerk or servant to transact such business on his or their behalf, and the name, residence, and date of appointment of such clerk or servant shall thereupon be endorsed on the licence of such person or persons, and shall be signed by him or them in the presence of and attested by the collector or comptroller of customs at the port for which such licence is granted, and all such appointments shall be recorded in a register to be kept at the custom-house for that purpose; and no person shall act as such clerk or servant unless so appointed, endorsed, and recorded, nor act for or on behalf of any other than the person or persons so appointing him; and every such appointment may be revoked by the Commissioners of Customs at any time, by order under their hands.—§ 16.

Commissioners to specify Ports in which Goods may be water borne by authorised Persons.—The Commissioners of Customs may order and direct in what ports or places in the U. K. goods cleared for drawback or from the warehouse shall be carried or water-borne to be put on board any ship for exportation, or goods carried or water-borne from any importing ship to, or to be landed at any wharf, quay, or other place, shall be so carried or water-borne only by persons authorised for that purpose by licence under the hands of the Commissioners of Customs, and may revoke any such orders or directions, or make others in lieu thereof, when and as they may deem expedient; and the Commissioners of Customs may grant such licences in such form and manner and to such persons as they may deem proper, and may revoke the same when and as they shall think fit; and before granting any such licence the commissioners may require such security by bond for the faithful and incorrupt conduct of such person as they shall deem necessary; and all such licences in force at the time of the commencement of this act shall continue in force as if the same had been granted under the authority of this act.—§ 17.

LIGHTHOUSE, a tower situated on a promontory, or headland, on the sea coast, or on rocks or banks in the sea, for the reception of a light for the guidance of ships at night.* There are also floating-lights, or lights placed on board vessels moored in certain stations, and intended for the same purposes as those on shore.

Historical Notices.—The lighting of fires for the direction of ships at night is of such obvious utility, that we need not wonder at the practice having originated at a very remote æra. The early history of lighthouses is, however, involved in much obscurity; but it is reasonable to suppose that no long period would elapse after fires were lighted for the premonition and guidance of mariners, till towers would begin to be constructed for their reception. The most celebrated of all the ancient lighthouses was that erected by Ptolemy Soter, on the small island of Pharos, opposite to Alexandria,—*nocturnis ignibus cursum navium regens.*—(*Plin.* lib. v. cap. 31.) It was of great height, and is said to have cost 800 talents.† Its celebrity was such, that Pharos rapidly became, and

* *Usus ejus, nocturno navium cursu ignes ostendere, ad prænuntianda vada, portusque introitum.*—(*Plin. Hist. Nat.* lib. xxxvi. cap. 12.)

† Dr. Gillies tells us (*Hist. of Alexander's Successors*, vol. ii. p. 138. 8vo. ed.) that the tower was 450 feet in height; that each side of its square base measured 600 feet, and that its "beaming summit" was seen at the distance of 300 miles! It is almost needless to add, that there is no authority for such statements, which, indeed, carry absurdity on their face.

An Account showing the Trades that cannot be carried on in the U. Kingdom without Excise Licences; the Sums charged for such Licences; and the Number of Licences granted for carrying on each Trade in the Year ending 31st March, 1858; with the Total Amount of Revenue derived therefrom.

Total revenue derived from excise licences in 1858, England, 1,172,850*l.* 7*s.* 1*d.*; Scotland, 127,805*l.* 9*s.* 4*d.*; Ireland, 124,446*l.* 10*s.* 11*d.*; total U. K., 1,425,102*l.* 7*s.* 4*d.*

There are, also, in the U. K., sundry businesses which cannot be carried on without a stamp licence, such as bankers, attorneys, pawnbrokers, &c. The licence duty paid by these parties amounted in the year ended 31st March, 1859, to 218,500*l.*

still continues to be in many countries, a generic term equivalent to lighthouse. In the ancient world, there were lighthouses at Ostia, Ravenna, Puteoli, Caprea, Rhodes, on the Thracian Bosphorus, &c.—(See *Suetonii Opera*, ed. *Pitisci*, tom. i. p. 755.; and the *Ancient Universal History*, ix. 366. 8vo. ed.)

The *Tour de Cordouan*, at the entrance of the Gironde, the Eddystone lighthouse, opposite to Plymouth Sound, and that more recently constructed on the Bell Rock, opposite to the Frith of Tay, are the most celebrated modern lighthouses. The Tour de Cordouan was begun in 1584, by order of Henry IV., and was completed in 1611. It was at first 169 feet (Fr.) high; but in 1727 it was enlarged, by the addition of an iron lantern, to the height of 175 French, or 186⅓ English feet. It used to be lighted by a coal fire, but it is now a revolving dioptric light of the first order. It is altogether a splendid structure;

and is, besides, remarkable for being the first lighthouse on which a revolving light was exhibited.—(See BORDEAUX.)

The first lighthouse erected on the Eddystone rocks only stood about 7 years, having been blown down in the dreadful storm of the 27th of November, 1703; a second, erected in 1708, was burnt down in 1755. The present lighthouse, constructed by the celebrated engineer Smeaton, was completed in 1759. It is regarded as a masterpiece of its kind; and bids fair to be little less lasting than the rocks on which it stands.

The Bell Rock lighthouse was built by Mr. Stevenson on the model of the Eddystone.

Numerous lighthouses, marking the most dangerous points and the entrance to the principal harbours, are now erected in most civilised maritime countries. They are particularly abundant in the Baltic and in the Sound, and have contributed, in no ordinary degree, to render their navigation comparatively safe. Within these few years several new ones have been erected on the British coasts, and on those of France, the United States, &c.

Precautions as to Lighthouses.—Many fatal accidents have arisen from ships mistaking one light for another; and hence the importance of those on the same coast being made to differ distinctly from each other, and of their position and appearance being accurately laid down and described. The modern inventions of revolving, intermitting, and coloured lights, afford facilities for varying the appearance of each light unknown to our ancestors, and have been, in that respect, of the greatest importance.

Chart of Lighthouses, &c.—A good descriptive work on lighthouses, beacons, &c., is a desideratum. That of Coulier, *Guide des Marins pendant la Navigation nocturne*, Paris, 1829, is perhaps the best. It must not be judged by its preface, which is as bad as possible; consisting of scraps from the most fantastical parts of Bryant's Mythology, and of attacks on us for our conduct in relation to Parga, and the alleged ill-treatment of the crew of a vessel wrecked on the island of Alderney! The book is really pretty good, which could not be anticipated from such a commencement. The reader will find the existing English and Irish lighthouses, and the greater number of those belonging to Scotland, laid down in the chart attached to the article CANALS in this work. Its accuracy may be depended upon; for it has been copied from the official chart of the lighthouses on the British and contiguous coasts published by the Trinity House.

Law as to British Lighthouses.—The 8 Eliz. c. 13. empowered the corporation of the Trinity House to erect beacons, &c. to prevent accidents to ships; and though the act does not expressly mention lighthouses, it has been held to extend to them; and on its authority, and the privileges attached to the office of buoyage and beaconage conferred on the Trinity House in 1594, the corporation erects lighthouses. The tolls for their maintenance have been generally collected under the authority of letters patent from the Crown; those for the support of the Eddystone light, and some others in different parts of the kingdom, being, however, established by act of parliament. The first lighthouse erected by the Trinity Corporation was in 1675; but several had been previously erected by private parties in virtue of letters patent.

All the lighthouses, floating-lights, &c., exclusive of harbour lights, from the Fern Islands, on the coast of Northumberland, round by Beachy Head and the Land's End, to the coast of Lancashire, have always belonged to the Trinity House, with the exception of about a dozen lights, viz., Tynemouth, Spurn (shore), Winterton and Orford, Harwich, Dungeness, Skerries, &c. These lights have been partly public and partly private property; but they have latterly been all acquired by the Trinity House.—(See below.) The duties on their account have been, for the most part, always payable to the Trinity collectors.

The act of 1853, 16 & 17 Vict. c. 131., and the Mercantile Shipping Act of 1854, have made the Trinity House directly subordinate in many respects to the Board of Trade. The dues for lights, ballastage, beaconage, &c., hitherto payable to the Trinity House, are in future to be carried to the account of the Mercantile Marine Fund, which is to be charged with the cost of maintaining lights, buoys, &c., and it, also, is to be charged with the pensions hitherto paid by the Trinity House. The latter is in future to prepare estimates; and no expense is to be allowed which has not previously been sanctioned by the Board of Trade. The charges for lights, &c., are to be revised and fixed by H. Majesty in Council, who who is, also, to fix the tolls to be taken for new lights. The attention that will thus be drawn to the different charges on shipping cannot fail to be advantageous; and will, no doubt, bring about their reduction to the lowest point consistent with the realisation of the important objects for which they have been imposed. The most important clauses in the Mercantile Shipping Act, the 17 & 18 Vict. c. 104., having reference to lighthouses, are as follows, viz.:

Management of Lighthouses, Buoys, and Beacons to be in Trinity House, &c.—Subject to the provisions herein contained, and subject also to any powers or rights now lawfully enjoyed or exercised by any person or body of persons having by law or usage authority over local lighthouses, buoys, or beacons, herein termed "local authorities," the superintendence and management of all lighthouses, buoys, and beacons shall be vested in the following bodies, viz.,

In England and Wales, and the islands of Jersey, Guernsey, Sark, and Alderney, and the adjacent seas and islands, and in Heligoland and Gibraltar, in the Trinity House:

In Scotland and the adjacent seas and islands, and in the Isle of Man, in the Commissioners of Northern Lighthouses.

In Ireland and the adjacent seas and islands, in the Port of Dublin Corporation:

And, subject to the provisions herein contained, the said Trinity House, Commissioners, and Corporation (herein termed General Lighthouse Authorities) shall respectively continue to hold and maintain all property now vested in them in that behalf in the same manner and for the same purposes as they have hitherto held and maintained the same.—§ 389.

Commissioners of Northern Lighthouses.—The persons holding the following offices shall be a body corporate, under the name of the Commissioners of Northern Lighthouses; that is to say,

(1.) The Lord Advocate and the Solicitor-General for Scotland;

(2.) The Lords Provosts of Edinburgh and Glasgow, and the Provosts of the Cities of Aberdeen, Inverness, and Campbeltown;

(3.) The eldest Bailies of Edinburgh and Glasgow;

(4.) The Sheriffs of the counties of Edinburgh, Lanark, Renfrew, Bute, Argyle, Inverness, Ross, Orkney, Caithness, Aberdeen, Ayr, Fife, Forfar, Wigton, Sutherland, Kincardine, Kircudbright, and Elgin;

And shall have a common seal; and any 5 of such commissioners shall constitute a quorum, and shall have power to do all such matters and things as might be done by the whole body of commissioners.—§ 390.

Power to Elect certain new Members.—In addition to the persons above mentioned, it shall be lawful for the said commissioners at any time after this act comes into operation to elect the provost or chief magistrate of any royal or parliamentary burgh, on or near any part of the coasts of Scotland, and the sheriff of any county abutting on such coasts.—§ 391.

Trinity House may inspect Lighthouses in Scotland and Ireland.—The Trinity House, their engineers, workmen, and servants, may at all times enter any lighthouses within the jurisdiction of the said commissioners or corporation, to view the condition thereof, or otherwise, for the purposes of this act.—§ 392.

B. of Trade may appoint Persons to inspect Lighthouses, &c.—The B. of Trade may, upon complaint to the effect that any lighthouse, buoy, or beacon under the management of any of the said general light-

house authorities, or any work connected therewith, is inefficient or improperly managed or unnecessary, authorise persons to inspect the same; and every person so authorised may inspect the same accordingly, and make such inquiries in respect thereof, as he may think fit; and all officers and others having the care of such lighthouses, buoys, or beacons, or concerned in the management thereof, shall furnish all such information and explanations in relation thereto as he may require; and the said general lighthouse authorities and their respective officers shall at all times give to the B. of Trade all such returns, explanations, or information in relation to the lighthouses, buoys, or beacons within their jurisdiction and the management thereof, as such Board may from time to time require.—§ 393.

Power to General Lighthouse Authorities to control local Authorities.—Each of the said general lighthouse authorities, upon giving due notice of their intention, shall have power, with the sanction of the B. of Trade, to compel any local authority having jurisdiction in the matter of lighthouses, buoys, or beacons at any place situate within the jurisdiction of such general lighthouse authority, to lay down buoys, or to remove or discontinue any existing lighthouse or beacon, or to make any variation in the character of any lighthouse or in the mode of exhibiting lights therein; and no such local authority as aforesaid shall erect any new lighthouse, or remove or discontinue any lighthouse, or vary the character of any lighthouse or the mode of exhibiting lights therein, without the sanction of the general lighthouse authority within whose jurisdiction the same is situate.—§ 394.

In case of Default by local Bodies local Lighthouses may be transferred to General Lighthouse Authorities.—If any local authority having power to erect, maintain, or place any local lighthouse, buoy, or beacon at any place within the jurisdiction of one of the said general lighthouse authorities fails so to do, or fails to obey any direction given by such authority under the last preceding section, H. M. may, upon application from such general lighthouse authority, by order in council direct that such power as aforesaid shall be transferred to such last-mentioned authority; and such power, together with all powers of levying and receiving dues in respect of such lighthouse, buoy, or beacon, shall thereupon become vested in such last-mentioned authority; and such lighthouse, with its appurtenances, and also such buoy or beacon, and all dues leviable in respect thereof, shall thenceforth be subject in all respects to the same regulations as other lighthouses and light dues, buoys and beacons provided for by this act.—§ 395.

Dues to be levied.—Subject to any alterations to be made under the powers hereinafter contained, the said general lighthouse authorities shall, in respect of the existing lighthouses, buoys, or beacons within their respective jurisdictions, continue to levy dues, herein called light dues, after the rate at which the same are levied at the time when this act comes into operation; and such light dues shall be payable in respect of all ships whatever, except ships belonging to H. M. and ships hereby exempted from payment thereof.—§ 396.

Light Dues to be subject to Revision by H. M. in Council.—H. M. may, with the advice of Her Privy Council, from time to time reduce all or any of the dues for the time being payable in respect of existing or future lighthouses, buoys, or beacons, for the time being under the management of the said general lighthouse authorities; and may also, with the like advice, from time to time increase or vary any of such dues, so that no dues payable in respect of any lighthouse, buoy, or beacon existing at the time when this act comes into operation, are made to exceed the amount which has at any period previous to such time been received in respect thereof, or to which the said dues might during any part of such period as last aforesaid lawfully have been raised.—§ 397.

Powers of General Lighthouse Authorities to alter and regulate Dues.—Each of the said general lighthouse authorities shall have power, with the consent of H. M. in council, to do any of the following things; that is to say,

To exempt any ships or any classes of ships from the payment of light dues receivable by such authority, and to annex any terms or conditions to such exemptions:

To alter the times, places, and modes at and in which the light dues receivable by such authority are payable:

To substitute any other dues or class of dues, whether by way of annual payment or otherwise, in respect of any ships or classes of ships, for the dues payable to such authority for the time being.—§ 398.

Publication of Dues and Regulations.—Tables of all light dues, and a copy of the regulations for the time being in force in respect thereof, shall be posted up at all custom houses within the U. K.; and each of the said general lighthouse authorities shall from time to time, as occasion requires, furnish copies of such tables and regulations to the C. of Customs in London, and to the principal officers of customs resident at all places where light dues are collected on account of such lighthouse authority; and such copies shall be posted up by the commissioners at the custom house in London, and by such officers at the custom houses of the places at which they are respectively resident.—§ 399.

Ship not to be cleared without Production of Receipt for Light Dues.—A receipt for light dues shall be given by the person appointed to collect the same to every person paying the same, and no officer of customs at any port where light dues are payable in respect of any ship shall grant a clearance or transire for any such ship, unless the receipt for the same is produced to him.—§ 400.

Power of Distress for Light Dues.—If the owner or master of any ship fails on demand of the authorised collector to pay the light dues due in respect thereof, it shall be lawful for such collectors, in addition to any other remedy which he or the authority by whom he is appointed is entitled to use, to enter upon such ship, and distrain the goods, guns, tackle, or any other thing of or belonging to or on board such ship, and to detain such distress until the said light dues are paid; and if payment of the same is not made within the period of 3 days next ensuing such distress, he may, at any time during the continuance of such nonpayment, cause the same to be appraised by two sufficient persons or sworn appraisers, and thereupon sell the same, and apply the proceeds in payment of the light dues due, together with all reasonable expenses incurred by him under this section, paying the surplus (if any) on demand to the said owner or master.

Clause 402 regulates the mode in which light dues are to be paid over and accounted for.

Application of Light Dues.—All light dues coming to the hands of any of the said general lighthouse authorities under this act shall be carried to the account of the mercantile marine fund herein-after mentioned, and shall be dealt with in manner herein-after described.—§ 403.

Power to Lighthouse Authorities to erect and alter Lighthouses, Buoys, and Beacons.—Each of the said general lighthouse authorities shall have power, within its jurisdiction, to execute the following works and do the following things; (that is to say,)

(1.) To erect or place new lighthouses, with all requisite works, roads, and appurtenances, or alter or remove any existing lighthouses:

(2.) To erect or place any new buoys or beacons, or alter or remove any existing buoys or beacons:

(3.) To take and purchase any land which may be necessary for the above purposes, or for the maintenance of the works or the residence of the light keepers:

(4.) To vary the character of any lighthouse or the mode of exhibiting lights therein:

(5.) To sell any land belonging to it:

But the exercise of the above power shall, in the case of the said commissioners and corporation, be subject to the restrictions herein-after contained.—§ 404.

Clause 405 directs that the powers given by the foregoing clause shall, in the case of the commissioners and corporation, be subject to approval by Trinity House, with appeal to B. of Trade.

Clauses 406 to 409 relate to proceedings between commissioners, &c., and B. of Trade.

H. M. may by Order in Council fix Dues to be taken for new Lighthouses.—Upon the completion of any new lighthouse, buoy, or beacon, H. M. may by order in council fix such dues in respect thereof to be paid by the master or owner of every ship which passes the same or derives benefit therefrom, as H. M. may deem reasonable, and may from time to time alter the amount thereof; and such dues shall be paid and collected in the same manner, by the same means, and subject to the same conditions in, by, and subject to which the light dues authorised to be levied by this act are paid and collected.—§ 410.

No Dues to be levied in the Channel Islands without Consent of the States.—No dues for any lighthouse, buoy, or beacon to be erected or placed in or near the islands of Guernsey, Jersey, Sark, or Alderney shall be taken in the said islands of Guernsey or Jersey without the consent of the states of the said islands respectively; nor shall any powers herein-before given to the Trinity House in respect of any lighthouse, buoy, or beacon erected or placed in the islands of Guernsey or Jersey, or hereafter to be erected or placed in such islands, be exercised without the consent of H. M. in council.—§ 411.

Incorporation of 8 *&* 9 *Vict. cc.* 18 *&* 19.—The Lands Clauses Consolidation Act, 1845, and the Lands Clauses Consolidation Act (Scotland), 1845, shall be incorporated in this act, and shall apply to all lighthouses to be constructed and all land to be purchased under the powers thereof.—§ 412.

Clause 413 relates to the surrender of local lighthouses to general lighthouse authorities.

Penalty for injuring Lights, Buoys, and Beacons.—If any person wilfully or negligently commits any of the following offences, (that is to say,)

(1.) Injures any lighthouse or the lights exhibited therein, or any buoy or beacon;

(2.) Removes, alters, or destroys any light ship, buoy, or beacon;

(3.) Rides by, makes fast to, or runs foul of any light ship or buoy;

He shall, in addition to the expenses of making good any damage so occasioned, incur a penalty not exceeding 50*l.*—§ 414.

Lighthouse Authorities may prohibit false Lights.—Whenever any fire or light is burnt or exhibited at such place or in such manner as to be liable to be mistaken for a light proceeding from a lighthouse, it shall be lawful for the general lighthouse authority within whose jurisdiction such place is situate, to serve a notice upon the owner of the place where the fire or light is burnt or exhibited, or on the person having the charge of such fire or light, either personally or by delivery at the place of abode of such owner or person, or by affixing the same in some conspicuous spot near to such fire or light, and by such notice to direct such owner or person, within a reasonable time to be therein specified, to take effectual means for the extinguishing or effectually screening such existing light, and for preventing for the future any similar fire or light; and any owner or person disobeying such notice shall be deemed guilty of a common nuisance, and in addition to any other penalties or liabilities of any kind thereby incurred, shall incur a penalty not exceeding 100*l.*—§ 415.

If not obeyed they may abate such Lights.—If any owner or person served with such notice as aforesaid neglects for a period of 7 days to extinguish or effectually screen the fire or light therein mentioned, it shall be lawful for the general lighthouse authority within whose jurisdiction the same may be, by their servants or workmen, to enter upon the place whereon the same may be, and forthwith to extinguish such fire or light, doing no unnecessary damage; and all expenses incurred by such authority in such extinction may be recovered from such person or owner as aforesaid in the same way as penalties are hereby directed to be recoverable.—§ 416.

The next part of the act, that which refers to the MERCANTILE MARINE FUND, is so much mixed up with the law as to light-houses, that it may be appropriately introduced in this place.

Sums to be carried to Mercantile Marine Fund.—The following sums shall be carried to a common fund, to be entitled the "Mercantile Marine Fund," viz.:

(1.) All fees and other sums (other than fines and forfeitures) received by the B. of Trade under the provisions of the third and fourth parts of this Act:

(2.) All light dues or other sums received by or accruing to the Trinity House, the Commissioners of Northern Lighthouses, and the Port of Dublin Corporation:

(3.) All rates and annuities received by the Trinity House under the local Act of the 7 Vict. c. 57, for the regulation of lastage and ballastage in the river Thames:

(4.) All fees and other sums mentioned in the table annexed hereto, which are received by receivers appointed under this act, viz:

Fees and Remuneration of Receivers.—For every examination on oath instituted by a receiver with respect to any ship or boat which may be or may have been in distress, a fee not exceeding — — — £ s. d. 1 0 0

But so that in no case shall a larger fee than 2*l.* be charged for examinations taken in respect of the same ship and the same occurrence, whatever may be the number of the deponents.

For every report required to be sent by the receiver to the Secretary of the Committee for managing the affairs of Lloyd's in London, the sum of — — £ s. d. 0 10 0

For wreck taken by the receiver into his custody, a per-centage of 5 per cent upon the value thereof,

But so that in no case shall the whole amount of per-centage so payable exceed 20*l.*

In cases where any services are rendered by a receiver, in respect of any ship or boat in distress, not being wreck, or in respect of the cargo or other articles belonging thereto, the following fees instead of a per-centage, viz.:

If such ship or boat with her cargo equals or exceeds in value 600*l.*, the sum of 2*l.* for the first, and the sum of 1*l.* for every subsequent day during which the receiver is employed on such service, but if such ship or boat with her cargo is less in value than 600*l.*, one moiety of the above-mentioned sum.

and an account of the said fund, intituled "The Mercantile Marine Fund Account," shall be kept with her Majesty's Paymaster General.—§ 417.

Application of Mercantile Marine Fund.—Subject to any prior charges that may be subsisting thereon by virtue of any act or acts of parliament or otherwise, the said fund shall be chargeable with the following expenses, viz.:

(1.) The salaries and other expenses connected with the local marine boards, the examinations, and the shipping offices, provided for by the third part of this act:

(2.) The salaries of surveyors, and other expenses connected with the survey of passenger steam ships provided for by the fourth part of this act.

(3.) All expenses incurred by the general lighthouse authorities aforesaid in the works and services of lighthouses, buoys, and beacons provided for by this act, or in the execution of any works necessary or expedient for the purpose of permanently reducing the expense of such works and services.

(4.) All expenses incurred by the Trinity House in respect of lastage and ballastage in the river Thames.

(5.) Such expenses for establishing and maintaining on the coasts of the U. K. proper life-boats, with the necessary crews and equipments, and for affording assistance towards the preservation of life and property in cases of shipwreck and distress at sea, and for rewarding the preservation of life in such cases, as the B. of Trade directs.

(6.) Any expenses incurred in carrying into effect the provisions with regard to receivers and the performance of their duties contained in this act.

(7.) Any expenses which by this or any other act of parliament are specially charged thereon.

And shall, save as herein-after mentioned, be applicable to no other purpose whatever.—§ 418.

Clause 419. relates to ballast and ballastage rates. (See BALLAST.)

Establishments for Lighthouses and Ballastage charged on Fund to be fixed by H. M. in Council.—H. M. may from time to time, with the advice of Her Privy Council, fix the establishments to be maintained by each of the said general lighthouse authorities on account of the services of lighthouses, buoys and beacons, and also as regards the Trinity House, on account of the service of lastage and ballastage in the river Thames, or the annual or other sums to be paid out of the said fund, in respect of such establishments; and if it appear that any part of the establishments of the said lighthouse authorities is maintained for the purposes of such duties and also for other purposes, to fix and from time to time alter the portion of the expense of such establishments to be paid out of the said fund; and no increase of any establishment or part of an establishment so fixed shall be made without the consent of the B. of Trade.—§ 420.

Clause 421. gives power to the general lighthouse authorities to grant superannuation allowances.

Clause 422. directs that estimates of all expenses to be incurred by lighthouse authorities shall be prepared and laid before the B. of Trade.

No Expense to be allowed unless sanctioned by B. of Trade.—No expense of any of the said general lighthouse authorities in respect of the said services shall be paid out of the mercantile marine fund, or allowed in account, other than the sums so allowed for establishment expenses as aforesaid, or included in estimates or accounts approved by the B. of Trade.—§ 423.

For the Purpose of erecting and repairing Lighthouses, &c., Treasury may advance Money.—For the purpose of the construction and repair of lighthouses, and of other extraordinary expenses connected with the said services, the Treasury may from time to time, upon the application of B. of Trade, advance

out of the produce of the consolidated fund of the U. K. such sums of money, upon such terms, and at such rate of interest as they think fit, and to pay the same into the mercantile marine fund account, so nevertheless that the whole sum for the time being due in respect of such advances shall never at any one time exceed 200,000*l.*; and upon any advance so made the sum advanced and the interest shall be a charge on the mercantile marine fund, and upon the dues, rates, fees, and payments carried thereto as aforesaid; and the B. of Trade shall make such provision for the repayment thereof out of the said fund, either by forming a sinking fund or otherwise, as the Treasury may require; provided that no such advance shall prevent any lawful reduction of any of the said dues, rates, fees, or payments, if such reduction be assented to by the Treasury.—§ 424.

Clause 425. gives power to the B. of Trade to borrow money on the credit of the fund.

Clause 426. gives power to public works loan commissioners to advance money for such purposes on the credit of the fund.

Lighthouse Authorities to account for Receipt and Expenditure to B. of Trade.—Each of the said general lighthouse authorities shall account to the B. of Trade for their receipts from the said light dues and ballastage rates, and for their expenditure as regards expenses paid out of the said fund, in such form, and at such times, and with such details, explanations, and vouchers, as the B. of Trade requires, and shall, when required by such Board, permit all books of accounts kept by or under their respective direction to be inspected and examined by such persons as the said Board appoints for that purpose.—§ 427.

Clause 428 directs that the accounts of the mercantile marine fund be audited by commissioners of audit.

Clause 429. directs that the accounts of the fund be laid before parliament.

Clause 430. directs that all property used for the purposes of lighthouses, buoys, beacons, light dues, &c., is to be exempt from all rates and taxes.

Fees on account of Light-houses.—A wish to keep the charges on native ships as low as possible, and to insure them a preference, seems to have given rise to the practice that has long existed, of exacting comparatively high duties from the foreign shipping entering our ports. But whatever may have been the motives for making this distinction, its policy seems more than questionable. It is quite right that the foreign ships coming to our shores for commercial purposes should be made to pay the *same* light and harbour duties as British vessels; but the imposition of comparatively high duties on them is decidedly injurious, inasmuch as it provokes retaliatory measures on the part of other states, obstructs the resort of foreigners to our markets, and, consequently, checks the growth of commerce.

This system was very properly condemned in a report by a committee of the House of Commons, in 1822. There is, in the evidence annexed to that report, some well authenticated instances of foreign ships having been totally lost, from the disinclination of the captains to enter a British port, while it was in their power, on account of the heavy charges to which they would have been exposed for lights, &c. ! Down, indeed, to 1835, all ships, whether native or foreign, coming into any British port by *stress of weather*, were charged with full light duties; but this inhospitable regulation was repealed by an order in council of the 7th of February of that year issued at the recommendation of the Trinity House, which exempts such vessels from all charges on account of lights. Our whole policy as to light duties, port charges, &c. has, within these few years, been materially improved, and is now the very reverse of illiberal. It is true that the discriminating duties on foreign ships are still kept up: but in consequence of the general establishment of reciprocity treaties, the distinction has become nominal rather than real, and affects very few of the ships using our seas.

We are glad, also, to have to announce, that large deductions have been, at different times made from the light duties; and after being still farther augmented, these deductions were fixed by an Order in Council, of the 2nd February, 1859, at 50 per cent. on vessels making Oversea, and at 35 per cent. on those making Coasting voyages. It is, indeed, quite essential to their utility that these duties should be moderate. They have the same influence upon the intercourse carried on by sea, that tolls have upon that carried on by land; and it is needless to add, that oppressive tolls are amongst the most effectual of all the engines by which rapacious ignorance has contrived to injure a country.*

Charges on account of Collection, &c.—The lighthouse revenue is believed to be, at this moment, much greater than is necessary for keeping the establishment in a state of perfect efficiency. The surplus revenue has been, in so far at least as depends on the Trinity House, very judiciously expended in maintaining decayed seamen, and other useful purposes. But, considering the vast importance of low shipping charges, such persons should be provided for in some less onerous way, and the light duties further reduced. Instead of reducing the charges generally on all lights, it has been proposed to make some of the more important lights duty free, as by this means the expense of collection would be saved, and business materially facilitated. This, however, would in effect impose a proportionally heavy charge on the ships belonging to the less frequented ports; so that, on the whole, the general reduction of the rates, or their abolition, would seem to be the better plan.

Lighthouses erected by Private Parties.—Private individuals erecting lighthouses have generally obtained a lease of the same from the Crown for a definite number of years, with authority to charge certain fees on shipping. Owing to the great increase of navigation, some of these lighthouses became very valuable properties. The most valuable were—

The Skerries, on a small islet or rock, to the north-west of the Island of Anglesey, was granted to the ancestor of its late proprietor, to be *for ever* holden by him, his heirs and assignees, by the act 3 Geo. 2. c. 36., which also gave the proprietor power to charge certain rates on all vessels passing the light. Previously to its purchase by the Trinity House, this light produced a nett revenue of about 20,000*l.* a year.

Harwich Lights, were held by General Rebow, under lease from the Crown, for 22 years from the 5th of January, 1827, paying the Crown 3-5ths of the nett duty collected.

Dungeness Light, was held under lease from the Crown by the Earl of Leicester for 20 years from Midsummer, 1829. Nett produce of the duties equally divided between the Crown and the lessee. The duties were reduced at the renewal of the lease from 1*d.* to ½*d.* per ton; and it was provided, that at its termination the lighthouses and buildings connected therewith, and the ground on which they are erected, should become the property of the Crown.

Winterton ness and Orfordness Lights, were held by Lord Braybrooke under a lease from the Crown, which would have expired on the 1st of June, 1849. Nett produce of the duties equally divided between the Crown and his lordship. The duties were reduced at the last renewal of the lease in 1828, from 1*d.* to ½*d.* per ton. At the expiration of the lease, the lighthouses, grounds, &c. were to become the property of the Crown.

Hunstanton Cliff Light, was held by S. Lane, Esq., under a lease from the Crown, which would have expired in 1849. From the 16th of October, 1837, 4-15th parts of the nett produce would have gone to the Crown; and the lighthouses, &c. would have become, at the expiration of the lease, the property of the Crown, as in the case of the Dungeness and Winterton lights.

* There is nothing new in this statement:—"*Avara manus portus claudit; et cum digitos contrahit, navium simul vela concludit; meritò enim illa mercatores cuncti refugiunt quæ sibi dispendia esse cognoscunt.*"—(*Cassiodorus*, lib. vii. cap. varia, 9.)

Account of the Lighthouses and Floating Lights under the Management of the Corporation of the Trinity House of Deptford Strond, the Commissioners of Northern Lighthouses and the Port of Dublin Corporation, specifying the Rates of Toll charged on British and Foreign Ships passing such Lights; with the gross Amount of Duties collected on account of such Lights during 1857.

Gross amount collected in 1857, 311,551*l.* 4*s.* 11*d.*

The Smalls lighthouse in St. George's Channel belonged originally to the Trinity Corporation; but having been leased by that body to private individuals, it became, in consequence of the great increase of navigation, a most valuable property. In proof of this it is only necessary to state that the Trinity House having, in 1822, proposed to purchase the reversion of the lease, which had then 54 years to run, the lessees demanded for it no less than 148,430*l.* The Trinity House subsequently effected the purchase; but, owing to the increase of commerce in the interim, they had to pay a larger sum, notwithstanding the diminished length of the lease!

Local Duties.

Lights, &c.	Oversea. British and Foreign Privileged.	Coasting. British and Foreign Privileged.
Cromarty. 1 Lighthouse. On all vessels arriving at or departing from any port or place in the Firth of Cromarty, within the Sutors of Cromarty, of and under 50 tons.	6d. per vessel.	
And for every additional 50 tons or part of 50 tons.	6d. —	
Chanonry. 1 Lighthouse. On all vessels which shall pass or derive benefit from the said light, of and under 50 tons.	6d. —	
And for every additional 50 tons or part of 50 tons - - - -	6d. —	
Carr Rock Beacon, and Isle of May Leading light. On all vessels for each time of crossing a line drawn from Buttonness to Fifeness; and on all vessels—to or from the Northward—for each time of crossing a line drawn from Fifeness to Whiteberryness, under 100 tons.	4d. —	
Of 100 and under 200 tons - - - - - - -	6d. —	
Of 200 tons and upwards - - - - - - -	8d. —	
But vessels may cross both of these lines on the same voyage for one payment.		
Loch Ryan. 1 Lighthouse. On all vessels arriving at or departing from any port or place within Loch Ryan, of and under 50 tons	6d. —	
And for every additional 50 tons or part of 50 tons - - - -	6d. —	
Devaar. 1 Lighthouse. On all vessels arriving at or departing from any port or place in the Bay of Campbeltown, of and under 50 tons.	6d. —	
And for every additional 50 tons or part of 50 tons.	6d. —	
There shall also be paid for the said lights in Loch Ryan and on Devaar, by every vessel of and under 50 tons that shall pass into or out of the great basin of the Clyde (which shall be considered to be bounded on the S.E. by a line drawn from Corsewall to Glenarm in Ireland, on the N. W. by another line drawn from the Mull of Kintyre to Fairhead in Ireland, and on the N. by a third line from Kintyre to the Heads of Air) a toll—being 3d. for each light—of.	6d. —	
And for every additional 50 tons or part of 50 tons - - - -	6d. —	
But vessels liable to the first toll for either of these lights are not chargeable with this in addition.		
Tees Buoys. On all vessels *passing* the buoys to or from the ports of Newcastle, Shields, Sunderland, Hartlepool, Stockton, or Whitby, under 40 tons, for each time of passing.	1d. —	
Of 40 tons and upwards, for each time of passing - - - - -	6d. —	
Lynn Well. Floating Light. On all vessels trading to or from the ports of Lynn or Wisbeach, or to or from the port of Boston if navigated to the southward of the Longsand, also on all vessels entering or departing from Lynn Deeps southward of the Longsand.	1d. per ton.	
Hunstanton. 1 Lighthouse. On all vessels passing to or from the ports of Lynn, Wisbeach, or Wells; or to or from the port of Boston southward.	1d. per 20 tons, or 1d. per 5 tons.	
Woodbridge Buoys. On all vessels *entering* the port of Woodbridge under 50 tons.	1s. per vessel.	
Of 50 and under 100 tons - - - - - -	2s. —	
„ 100 tons and upwards - - - - - -	3s. —	
Trinity Duties. Buoyage and Beaconage. On all vessels *entering* the port of London. (On coasting vessels, the duty is levied on those conveying goods or passengers from any port beyond Leigh or Faversham.)	1d. per ton.	8-16ths*d.* per ton.
Wholly laden with coals - - - - - - - -	- - -	4-16ths*d.* —

Abatement.—Until Her Majesty, with the advice of Her Privy Council, may see fit otherwise to determine, there shall be allowed to every person paying such tolls (being those specified in the foregoing tables) an abatement or discount upon the amount payable by him; which abatement or discount shall, in the case of every Oversea vessel, be 50 per cent.; and on every Coasting vessel 35 per cent.

The Scotch or Northern Lights are under the management of a set of parliamentary commissioners. The act 6 & 7 Will. 4. c. 79. s. 40. enacts, that from the 1st of January, 1837, all British and foreign privileged vessels, not wholly in ballast, which shall pass any Scotch lighthouse, or derive any benefit therefrom, shall pay ¼d. per ton for each time of passing every such lighthouse, except that on the Bell Rock, for which they are to pay 1d. per ton each time of passing. Foreign vessels, not privileged, pay double these rates.

Irish Lights.— The rates of charge are as follows :—

Foreign vessels, ½d. per ton for each light passed; except harbour lights, which are only chargeable to vessels entering the ports within which they are situated.

British and Irish, ¼d. per ton (½d. if in ballast), for each light, except as above.

With a duty of 2s. on every entry, cocket, or warrant, when from foreign ports, but not otherwise.

Compensation to Private Parties.— The authority acquired by certain individuals and public bodies under letters patent, acts of parliament, and otherwise, of levying certain duties on account of lights, beacons, pilotage, harbour dues, &c. entitled them, for the most part, to demand higher fees from foreign than from British shipping. When, therefore, we entered into reciprocity treaties with foreign powers, government had to compensate the parties in question for the diminution that consequently took place in their charges on foreign ships. But this payment has now ceased, the Trinity Corporation having long since relinquished their claim to compensation; and the act 6 & 7 Will. 4. c. 79. having forbid such compensation being made to them, the Commissioners of Northern Lights, and the commissioners for *managing* the Irish lights.—(For some account of the Trinity Corporation, the reader is referred to that article; and for accounts of the charges on account of Beaconage, Ballastage, Pilotage, &c. see these titles.)

The following account of the British and Irish Light-Houses and Floating Lights has been taken from the official statement published by the Admiralty, corrected to 1858.

I. English Light-Houses. 1858.

Those marked * are what are called first-class lights.

Name of Light.	Place.	N. Latitude.	W. Longitude.	Number of Lights.	Fixed, Flashing, Fix. & Fl. Int., Alt. Revolving.	Interval of Revolution or Flash.	Miles seen in clear Weather.	Colour, or any Peculiarity of Light house.	Height in Feet Centre of Lantern bove High Water.	Height in Feet of Building from Base to Vane.	Year lighted.

† There are three Lights between Port Glasgow and Bowling Bay:—the 1st at Auchenlech, nearly three-quarters of a mile above Port Glasgow—the 2nd a floating Light, called the Garmoyle Light, 2¼ miles further up—and the 3d Dickies Light, about a mile above Dumbarton. All these are to be left on the Starboard hand, going up the River.

LIMA, the capital of Peru, on the west coast of South America, lat. 12° 2′ 42″ S., lon. 77° 7′ 15″ W. Population variously estimated; but may probably amount to from 50,000 to 60,000.

Callao, the port of Lima, is about 6 miles W. from the latter. The harbour lies to the north of a projecting point of land, in the angle formed by the small uninhabited island of San Lorenzo. Previously to the emancipation of Peru, and the other *ci-devant* Spanish provinces in the New World, Lima was the grand *entrepôt* for the trade of all the west coast of South America: but a considerable portion of the foreign trade of Peru is now carried on through Buenos Ayres, and the former is also in the habit of importing European goods at second hand from Valparaiso and other ports in Chili. The exports from Lima consist principally of silver, which is by far the most important article, copper ore, bark, soap, Alpaca wool, &c. Guano is found in large quantities on some parts of the coast of Peru, but is principally imported from some small islands, opposite to Piseo, where it is found in vast quantities. The great value of guano as a manure is now generally recognised, and it is hardly of less importance as an article of commerce, no fewer than 288,362 tons having been imported in 1857 into the U.K., of which 264,230 tons, estimated as being worth 3,434,990*l.*, were from Peru. That which she supplies is decidedly the best. The imports consist principally of cotton stuffs, linens, woollens, and hardware, principally from England; silks, brandy, wine, and quicksilver from Spain and France; stock-fish and flour from the United States, indigo from Mexico, Paraguay herb from Paraguay, spices, dye-stuffs, &c. Timber for the construction of ships and houses is brought from Guayaquil. The declared value of the different articles of British produce and manufacture exported to Peru in 1857, amounted to 1,171,864*l.*

Monies, Weights, and *Measures,* same as those of Spain; for which, see CADIZ.

LIME (Ger. *Kalk;* Fr. *Chaux;* It. *Calcina, Calce;* Sp. *Cal;* Rus. *Iswest*), an earthy substance of a white colour, moderately hard, but which is easily reduced to powder, either by sprinkling it with water or by trituration. It has a hot burning taste, and in some measure corrodes and destroys the texture of those animal bodies to which it is applied. Specific gravity, 2·3. Calcium, the metallic basis of lime, was discovered by Sir H. Davy.

There are few parts of the world in which lime does not exist. It is found purest in limestone, marble, and chalk. None of these substances is, however, strictly speaking, lime; but they are all easily converted into it by a well-known process; that is, by placing them in kilns or furnaces constructed for the purpose, and keeping them for some time in a white heat, — a process called the burning of lime. — (*Thomson's Chemistry.*)

The use of lime as mortar in building, has prevailed from the earliest antiquity, and is nearly universal. It is also very extensively used in this country, and in an inferior degree in some parts of the Continent and of North America, as a manure to fertilise land. But it is a curious fact that the use of lime as a manure is entirely a European practice; and that its employment in that way has never been so much as dreamed of in any part of Asia or Africa, unless by Europeans. Lime is of much importance in the arts, as a flux in the smelting of metals, in the shape of chlorate in bleaching, in tanning, &c. Lime and limestones may be carried and landed coastwise without any customs document whatever. Its consumption in this country is very great.

LIME (Fr. *Citronier;* Ger. *Citrone;* Hind. *Neemdo*), a species of lemon (*Citrus medica,* var. δ C.), which grows in abundance in most of the West India islands, and is also to be met with in some parts of France, in Spain, Portugal, and throughout India, &c. The lime is smaller than the lemon, its rind is usually thinner, and its colour, when the fruit arrives at a perfect state of maturity, is a fine bright yellow. It is uncommonly juicy, and its flavour is esteemed superior to that of the lemon; it is, besides, more acid than the latter, and to a certain degree acrid.

LINEN (Ger. *Linnen, Leinwand;* Du. *Lynwaat;* Fr. *Toile;* It. *Tela, Panno, lino;* Sp. *Lienza, Tela de lino;* Rus. *Polotno*), a species of cloth made of thread of flax or hemp. The linen manufacture has been prosecuted in England for a very long period; but though its progress has been considerable, particularly of late years, it has not been so great as might have been anticipated. This is partly, perhaps, to be ascribed to the efforts that have been made to bolster up and encourage the manufacture in Ireland and Scotland, and partly to the rapid growth of the cotton manufacture — fabrics of cotton having to a considerable extent supplanted those of linen.

In 1691, both houses of parliament addressed his Majesty (William III.), representing that the progress of the woollen manufacture of Ireland was such as to prejudice that of this country; and that it would be for the public advantage were the former discouraged, and the linen manufacture established in its stead. His Majesty replied,—"I shall do all that in me lies to discourage the woollen manufacture in Ireland, and encourage the linen manufacture, and to promote the trade of England!" We may remark, by the way, that nothing can be more strikingly characteristic of the illiberal and erroneous notions that were then entertained with respect to the plainest principles of public economy, than this address and the answer to it. But whatever the people of Ireland might think of their sovereign deliberately avowing his determination to exert himself to

crush a manufacture in which they had begun to make some progress, government had no difficulty in prevailing upon the legislature of that country to second their views, by prohibiting the exportation of all woollen goods from Ireland, except to England, where prohibitory duties were already laid on their importation! It is but justice, however, to the parliament and government of England, to state that they have never discovered any backwardness to promote the linen trade of Ireland; which, from the reign of William III. downwards, has been the object of regulation and encouragement. It may, indeed, be doubted whether the regulations have been always the most judicious that might have been devised, and whether Ireland has really gained any thing by the forced extension of the manufacture. Mr. Young and Mr. Wakefield, two of the highest authorities as to all matters connected with Ireland, contend that the spread of the linen manufacture has not really been advantageous. And it seems to be sufficiently established, that though the manufacture might not have been so widely diffused, it would have been in a sounder and healthier state, had it been less interfered with.

Bounties. — Besides premiums and encouragements of various kinds, bounties were granted on the exportation of linen for a very long period previously to 1830. In 1829, for example, notwithstanding it had then been very much reduced, the bounty amounted to about 300,000*l.*, or to nearly *one seventh* part of the entire real or declared value of the linen exported that year! It is not easy to imagine a greater abuse. A bounty of this sort, instead of promoting the manufacture, rendered those engaged in it comparatively indifferent to improvements: and though it had been otherwise, what is to be thought of the policy of persisting for more than a century in supplying the foreigner with linens for less than they cost? We have not the least doubt that were the various sums expended in well-meant but useless attempts to force this manufacture, added together, with their accumulations at simple interest, they would be found sufficient to yield an annual revenue, little, if at all, inferior to the entire value of the linens we now send abroad. And after all, the business never began to do any real good, or to take firm root, till the manufacture ceased to be a domestic one, and was carried on principally in mills, and by the aid of machinery, a change which the old forcing system tended to counteract. The only real and effectual legislative encouragement the manufacture has ever met with, has been the reduction and repeal of the duties on flax and hemp, and the relinquishing of the absurd attempts to force their growth at home.

Irish Linen Manufacture.—Spinning by the hand is now almost unknown in Ireland, and the manufacture has disappeared from several parts of the country, where it had been largely introduced. On the whole, however, there can be no doubt that the introduction of the factory system has been, and will continue to be, most advantageous. Belfast has long been the great seat of the manufacture in Ireland, and there it is carried on in large factories furnished with the best machinery, and conducted on the most approved principles. In 1841, there were in the town and its immediate vicinity, 25 steam mills for spinning linen yarn, one of which employed 800 hands; and in 1854, the number of mills had increased to 33, while their size and efficiency have also been considerably augmented. The value of the exports of all sorts of linen manufactures from Belfast in 1850, has been stated at 2,804,106*l.* And the exports from all Ireland were supposed to amount, in 1857, to about 106,000,000 yards, worth about 4,400,000*l.* Only an inconsiderable part of the exports goes direct to foreign countries; by far the greater portion is sent by the Cross-channel trade to Great Britain, or rather to Liverpool. According to the latest returns, there were in Ireland, in 1858, 76 flax mills, employing, in all, about 32,000 hands. We may add that in 1825 the trade between Great Britain and Ireland was placed on the footing of a coasting trade, and no official details of the linens imported or exported from or to either country has since been kept at the Custom-house; but, though not official, such of the foregoing statements, as refer to them are, we believe, nearly accurate.

The culture of flax in Ireland, which increased very rapidly down to 1853, has since declined with nearly equal rapidity. In 1858 it extended over about 91,500 acres, of which about 86,000 were in Ulster. (For further details, see *Thom's Irish Almanac for* 1859, p. 576.)

Scotch Linen Manufacture. — In 1827, a Board of Trustees was established in Scotland for the superintendence and improvement of the linen manufacture. It is not easy to suppose that the institution of this Board could of itself have been of any material service; but considerable bounties and premiums being at the same time given on the production and exportation of linen, the manufacture went on increasing. Still, however, it did not increase so fast as cotton and some others, which have not received any adventitious support, until machinery began to be extensively employed in the manufacture; so that it is very doubtful whether the influence of the bounty has been so great as it would at first sight appear to have been. The regulations as to the manufacture, after having been long objected to by those concerned, were abolished in 1822; and the bounties ceased in 1830.

Dundee is the grand seat of the Scotch linen manufacture; and its progress there during the last few years has been so extraordinary, that the following details in respect to it may not be unacceptable.

The manufacture appears to have been introduced into Dundee some time towards the beginning of last century; but, for a lengthened period, its progress was comparatively slow. In 1745 only 74 tons of flax were imported, without any hemp; the shipments of linen cloth during the same year being estimated at about 1,000,000 yards, no mention being made either of sail-cloth or of bagging. In 1791, the imports of flax amounted to 2,444 tons, and those of hemp to 299 tons; the exports that year being 7,842,000 yards linen, 280,000 yards sail-cloth, and 65,000 do. bagging. From this period the trade began to extend itself gradually, though not rapidly. Previously to the peace of 1815, no great quantity of machinery was employed in spinning; but about this period, in consequence, partly and principally, of the improvement of machinery, and its extensive introduction into the manufacture, and partly of the great regularity with which supplies of the raw material were obtained from the Northern Powers, the trade began rapidly to increase. Its progress has, indeed, been quite astonishing; the imports of flax and hemp having increased from about 3,000 tons in 1814 to 15,000 tons in 1830, and to 46,361 tons at an average of 1857 and 1858.

The particulars of the imports in these years were

	1857.	1858.		1857.	1858.
Flax - - - tons.	29,656	27,289	Brought forward - tons.	36,692	34,163
Flax Codilla - - „	6,123	6,064	Hemp Codilla - - „	25	28
Hemp - - - „	913	810	Jute - - - - „	15,459	6,358
Carried forward - „	36,715	34,163	Total - - - „	52,174	40,549

Of this quantity about 40,000 tons were spun by the mills in the town, and the residue by those in the vicinity.

We gave in a former edition an account of the number of pieces of the different descriptions of linen goods annually exported from Dundee. But large quantities are now sent off by railway; and as the carriage on them is charged by weight, no account is kept of the pieces so dispatched; and, consequently, no account can now be given of the total quantities exported. We have, however, been assured, by a high authority in the town, that the total value of the linens exported from Dundee in 1858 may be safely estimated at 3,100,000*l.*

It is not easy to give any satisfactory explanation of the wonderful progress of the linen manufacture at Dundee. Something must be ascribed to the convenient situation of the port for obtaining supplies of the raw material; and more, perhaps, to the manufacture having been long established in the towns and villages of Strathmore, the Carse of Gowrie, and the northern parts of Fife, of which Dundee is the emporium. But these circumstances do not seem adequate to explain the superiority to which she has recently attained in this department; and, however unphilosophical it may seem, we do not really know that we can ascribe it to anything else than a concurrence of fortunate accidents. Nothing, in fact, is so difficult to explain as the superiority to which certain towns frequently attain in particular departments of industry, without apparently possessing any peculiar facilities for carrying them on. But from whatever causes their pre-eminence may arise in the first instance, it is very difficult, when once they have attained it, for others to come into competition with them. They have, on their side, established connections, workmen of superior skill and dexterity in manipulation, improved machinery, &c. Recently, indeed, the advantages in favour of old establishments have been, to a considerable extent, neutralised by the prevalence of combinations amongst their workmen; but it is to be hoped that means may be devised for obviating this formidable evil.

Dunfermline, in Fife, with the contiguous district, is the principal seat of the manufacture of napery. The table-cloths which it supplies are of the best quality, and their patterns have latterly been greatly improved. They are now fully equal to, if they do not surpass, the very best specimens furnished by Germany and the Low Countries. In fact, table-linen is now shipped from this country for Germany; so that the duty of 10 per cent. on the importation of German damasks and such like fabrics might be reduced, or even repealed, without the measure having any injurious influence over the manufacturer.

In England the linen manufacture is principally seated in Leeds and its immediate vicinity, where there are some very large mills, and in other parts of the W. Riding. It is also carried on in parts of Lancashire, Dorset, Durham, and Salop.

It is, perhaps, needless to add that the state of the linen trade in 1854 affords no fair criterion of its ordinary state. Probably no branch of industry has suffered so much from the war; partly and principally by the obstacles it threw in the way of the importation of flax and hemp, and partly also by its unfavourable influence in sundry foreign markets.

Value of the Manufacture. Number of Persons employed.—There are no means by which to form an accurate estimate of the entire value of the linen manufacture of Great Britain and Ireland. Dr. Colquhoun estimated it at 15,000,000*l.*, but there cannot be a doubt that this estimate was, at the time, much exaggerated. In the first edition of this work we estimated the annual value of the manufacture at 7,500,000*l.** But it has increased very rapidly in the interval, and its value is at present (1858) probably not under, if it do not exceed, 12,000,000*l.* But taking it at this amount, and setting aside a third part of this sum for the value of the raw material, and another third for profits, wages of superintendence, wear and tear of capital, coal, &c., we have 3,333,000*l.* to be divided as wages amongst those employed in the manufacture. And supposing each individual to earn, at an average, 30*l.* a year, the total number employed would be about 130,000. It may be thought, perhaps, that 25*l.* is too low an estimate for wages; and such, no doubt, would be the case, were not Ireland taken into the average. But as many persons are there employed in the manufacture at very low wages, we believe that 30*l.* is not very far from the mean rate.† We may add that according to the returns under the census of 1851, 98,860 persons were then employed in the linen manufacture in G. Britain, of whom 72,535 were employed in Scotland, and 26,325 in England.

Export of Linens to France.—Previously to 1833 the export of linens and linen-yarn

* Sir F. M. Eden estimated the entire value of the linen manufacture of Great Britain in 1800 at 2,000,000*l.*—(*Treatise on Insurance*, p. 76.)

† A great number of persons in Ireland are only partly employed in the manufacture; but the above estimate supposes that the 130,000 individuals are wholly employed in it.

from this country to France was quite inconsiderable. It then, however, began to increase; and the oppressive duties that previously existed on the importation of these articles into France having been materially reduced in 1834-36, so powerful a stimulus was given to the trade, that the exports of yarn from the U. K. to France rose from 4,012,141 lbs. in 1836, to 22,202,292 lbs. in 1842. This influx of foreign yarn having, of course, subjected the French spinners to considerable temporary difficulties, they set up a cry for the reimposition of the duties; and the government being weak enough, or ignorant enough, to listen to their interested representations, the duties were again largely augmented in 1842. In consequence the exports of yarn, &c., from this country to France declined even more rapidly than they had increased. But we may shortly state, that the injury which the French government has done by this measure to our spinners is but trifling compared with that which they have done to their own subjects; for, while they have stopped all progress in the manufacture, and deprived the producers of the articles sent hither in exchange for yarns of their best market, they have about doubled the price of linens to the consumers. Had the French government wished to favour the manufacture, and been actuated by anything save the narrowest prejudices, it would have allowed the reduced duties to remain as they were, and have opened their ports to the free importation of foreign iron and machinery. In this way they might, perhaps, by reducing the cost of spinning mills and power-loom factories, have had some chance of rivalling us; but the attempts that have been made to bolster up the manufacture by means of duties, must necessarily fail; and will have no effect but to perpetuate exploded practices and promote the trade of smuggling. We beg to subjoin

An Account of the Pounds Weight of Linen Yarn exported from the U. Kingdom to France during each of the undermentioned Years ending with 1857.

Years.	British Linen Yarn exported from U. K. to France.	Years.	British Linen Yarn exported from U. K. to France.

The U. States, Brazil, Cuba, and the Hanse Towns, but especially the first, are by far the largest importers of manufactured linens. The above table shows that the falling off in the export of yarn to France has been more than compensated by its increased exportation to other places. The great outlets for yarn are at present (1859) the Hanse Towns, Spain, inc. Gibraltar, Holland, and Belgium.

LIQUORICE (Ger. *Sussholz*; Fr. *Réglisse, Racine douce*; It. *Regolizia, Ligorizia, Liquirizia*; Sp. *Regaliz Orozuz*), a perennial plant (*Glycirrhiza glabra*), a native of the south of Europe, but cultivated to some extent in England, particularly at Mitcham in Surrey. Its root, which is its only valuable part, is long, slender, fibrous, of a yellow colour, and when fresh very juicy. The liquorice grown in England is fit for use at the end of 3 years; the roots, when taken up, are either immediately sold to the brewers' druggists, or to common druggists, by whom they are applied to different purposes, or they are packed in sand, like carrots or potatoes, till wanted. Liquorice-root was charged till 1853 with a duty of 5*s.* per cwt., when it became duty free.

LIQUORICE JUICE (*Succus Liquoritiæ*), popularly *black sugar*, the inspissated juice of the roots just mentioned. Very little of this extract is prepared in Britain, by far the greater part of our supply being imported from Sicily. The juice obtained by crushing the roots in a mill, and subjecting them to the press, is slowly boiled till it becomes of a proper consistency, when it is formed into rolls of a considerable thickness, which are usually covered with bay leaves. This is the state in which we

import it. Most part of it is afterwards redissolved, purified, and cast into small cylindrical rolls of about the thickness of a goose quill, when it is called *refined liquorice*. It is then of a glossy black colour, brittle, having a sweet mucilaginous taste. It is used in the *materia medica*, particularly in coughs, colds, &c. What is called *liquorice paste* is an inferior or coarser variety of the same article, mostly brought from Turkey.—(*Thomson's Chemistry; Thomson's Dispensatory.*)

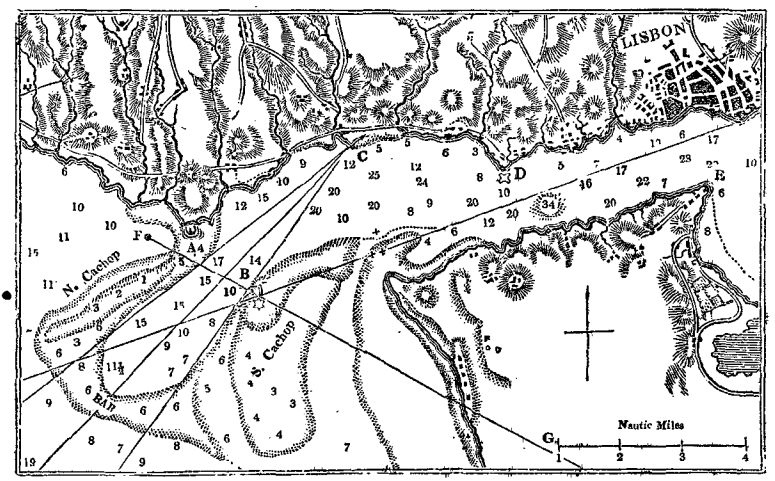
The oppressive duty of 3*l.* 15*s.* a cwt., with which it was loaded down to 1842, was reduced in that year to 27*s.* 6*d.*; and in 1853 to 20*s.*

The imports of juice and paste amounted together in 1857 to 12,770 cwt., whereof 7,964 cwt. of the former, and 1,533 do. of the latter, were entered for consumption.

LISBON, the capital of Portugal, on the N. bank of the Tagus, the observatory of the fort being in lat. 38° 42′ 24″ N., long. 9° 5′ 50″ W. The city proper is surrounded by walls with gates or barriers, at which articles of food, drink, and firing for the use of the town pay octrois or duties. Total population, in 1855, about 220,000, whereof 170,000 are within and 50,000 without the walls.

Lisbon, within the walls, paid in 1854-55, from 1st July, 1854, to 30th June, 1855, 95,000*l.* public taxes, 200,000*l.* town dues, and 46,000*l.* municipal charges: it consumed, during the same period, 11,877 sheep; 13,139 pigs; 19,826 oxen; 3,656 calves; 141,000 gallons of wine, and 143,000 imp. qrs. of wheat: the town dues are received by government.

Port.—The harbour, or rather road, of Lisbon is one of the finest in the world, and the quays are at once convenient and beautiful. Fort St. Julian marks the northern entrance of the Tagus. It is built on a steep projecting rock. There is a light-house in the centre, 120 feet above the level of the sea. At the mouth of the Tagus are two large banks, called the North and South *Cachops*. There are two channels for entering the river; the north or little, and the south or great channel, exhibited in the subjoined plan. On the middle of the South Cachop, about 1¼ mile from Fort St. Julian, is the Bugio fort and light-house, the latter being 66 feet in height. The least depth of water in the north channel on the bar is 4 fathoms, and in the south, 6. The only danger in entering the port arises from the strength of the tide; the ebb running down at the rate of 7 miles an hour; and after heavy rains, when there is a great deal of fresh water in the river, the difficulty of entering is considerably augmented. When, at such periods, there is a strong wind from the sea, there is a complete break all over the bar; vessels moor up and down the river with open hawse to the southward. In some parts they may come within 200 yards of the shore, being guided by the depth of water, which, from nearly 20 fathoms in mid-channel, shoals gradually to the edge.



References to Plan.—A, Fort St. Julian and light-house. B, Bugio fort and light-house. C, Barcarena look-out house. D, Belem Castle. E, Point Cassilhas. F G, Bugio Fort and Sugar Loaf Hill in one, mark the north channel.

Trade, &c.—Though one of the best situated commercial cities of Europe the commerce of Lisbon cannot be very extensive, as the country she supplies is but small, and in a very backward state of improvement. Contrary, however, to what might perhaps be expected, nowhere is political and religious tolerance carried to a greater extent: there are (1855) 8 daily newspapers, 7 political, and 1 commercial, the latter ably conducted. The police is excellent, and one may walk through all parts of the town at all hours of the night in perfect security. The present Minister of Finance is inclined to free trade, but the ignorance and prejudices of the majority of the people and of the members of parliament, and the fear of diminishing the revenue, are formidable obstacles to the introduction of a more liberal system. Lisbon has a government commercial school, a commercial association, and a small though pretty exchange. It is lighted by gas.

The importation duties levied at the custom house for the year ending 30th July, 1854, were 415,000*l.*: the principal imports were:—

Cotton yarn	241,800 lbs.	Duties £4,600	Cheese	1,450 cwt.	Duties £1,200
„ goods	5,482,200 „	„ 97,700	Olive oil	61,500 galls.	„ 3,000
Woollen goods	377,600 „	„ 43,600	Tobacco leaf	16,800 cwt.	„ 30,520
Linen goods	778,000 „	„ 7,800	Earthenware	1,000 „	„ 2,000
Silk goods	29,700 „	„ 15,800	China	250 „	„ 1,200
Flax and hemp	650 tons	„ 700	Glass	260 „	„ 800
Wines and liquors	11,800 galls.	„ 970	Wrought steel	1,100 „	„ 1,800
Rice	41,400 cwt.	„ 8,600	Iron bars, bundles & hoops	4,060 tons	„ 2,400
Sugar	137,700 „	„ 98,808	Hardware	215 „	„ 2,200
Coffee	16,800 „	„ 5,400	Coals	85,000 „	„ 1,050
Tea	251,000 lbs.	„ 9,700	Timber	1,554,500 feet	„ 2,400
Codfish	46,100 cwt.	„ 15,300	£518,000 in gold specie		free.
Butter	18,500 „	„ 25,400			

The duties on exportation are 1 per cent., excepting wines, liquors, oak bark, vinegar, gold and silver, rags and argol. Chief exports, in 1854, wheat 39,100 qrs. (35,400 to England, 3,500 to France), wine 258,000 gallons, 1,170 tons cork wood, 62,000 tons salt, 2,350 cwt. tartar, 62,000 half chests oranges, 640 tons wool, and 2,700 tons onions. The arrivals and departures of vessels, inc. repeated voyages, were in—

Other ports	64	4,002
	591	82,402

There are regular means of steam communication between Lisbon and Southampton 3 times a month by the Peninsular and Steam Navigation Company.

Southampton	1	a month	Royal Mail Steam Packet Cmp.
Glasgow	2	,,	2 Glasgow Steam Boats
Live. pool	3	,,	4 Liverpool ,,
Havre and Rouen	1	,,	French ,,
Nantz	1	,,	,, ,,
Brazils	1	,,	Royal Mail Steam Packet Cmp.
,,	2	,,	in 3 mths by 2 Portuguese steamers.

There are at Lisbon the following Insurance companies and agencies:

Fidelidade (Sea, Fire and Life Insurance)	capital £300,000	by shares.
Unial Commercial (Sea and Fire)	,, 122,000	,,
Restauracad (Sea and Fire)	,, 44,500	,,
Garantie (Oporto Company) Sea and Fire Insurance	,, 223,000	,,
Seguranca (Do. do.)	,, 223,000	,,
Equidade (Do. do.)	,, 223,000	,,

Agencies of the English companies Athenæum, Albion, Sun, Liverpool and London and Norwich Union, and of the Madrid Life Insurance Companies.

Port Regulations.—All vessels coming over the bar are to heave to at the Paço d'Arcos that they may be registered and receive on board a customs officer. Masters of vessels must bring with them a manifest or the cargo, containing shippers' and receivers' names, marks, number and contents of packages, legalised by the Portuguese consul at the port of departure. They will otherwise be fined double the amount of duties. The bill of health must contain the number and names of passengers, and be also legalised by the Portuguese consul. Passengers must be provided with passports: masters of vessels are otherwise liable to pay a fine.

Vessels loading, unloading, or merely remaining in the port (in *franquia*), which they are permitted to do for 6 days (or for 10 days if sufficient grounds be assigned for the indulgence), must anchor in and continue in the situation pointed out by the authorities. And as any infringement of the customs or port regulations is followed by heavy fines, and is often the cause of much delay, they should be carefully attended to.

All masters of vessels, seamen and passengers, are obliged to deliver up *to the authorities*, who come on board, all soap and tobacco they may possess, being only allowed to retain what may be deemed sufficient for own use on board. Any tobacco or soap found in their possession while going on shore is seized and the bearer subjected to imprisonment and to very heavy fines; the tobacco taken from the parties on arrival is restored to them on leaving.

Port Charges consist of pilotage and tonnage dues. Pilotages inwards for vessels of 3 masts 35*s.* 6*d.*; of 2 masts and 1 ditto, 27*s.* 6*d.* Pilotages outwards for vessels of 3 masts, 32*s.*; of 2 masts and 1 ditto, 24*s.* Tonnage dues are rather complicated. Vessels coming in with a full cargo and leaving in ballast, coming in and leaving in ballast, coming in with cargo and leaving with foreign goods, pay 13½*d.* per ton; also vessels taking ⅔ of the cargo salt and foreign goods pay said tonnage dues on the goods.

Vessels arriving loaded and leaving with cargo pay for Portuguese goods 8*d.*, the same vessels taking ⅔ salt and the remainder goods pay on the Portuguese goods. Vessels coming in and going out with the same cargo pay 32*d.* per ton, also those which come in loaded and leave with a full cargo of salt, and those which take ⅔ of the cargo salt pay this tonnage duty on the salt. Vessels arriving in ballast and leaving with a full cargo of salt pay no tonnage dues, and vessels putting in in distress. No tonnage dues are paid on grain, oil, or salt, if they form ⅔ of the cargo, the vessel clearing for Lisbon.

Money.—Gold is the circulating medium, silver being only legal tender to the extent of 22*s.* 5*d.* in any payment. The gold in circulation is almost all *British coin*, sovereigns and half-sovereigns, the former having a legal value of 4,500, the latter of 2,250 reis. There are also some Portuguese coins, 6,000 reis pieces and 4,000 reis in circulation, and a few 5,000, 2,500, and 1,000 reis pieces. Silver, the old coins of 480, 240, 120, and 60 reis, are being withdrawn; the new coins consist of 500, 200, 100, and 50 reis pieces. Copper 40, 20, 10, and 5 reis pieces. The mille reis is thus about 4*s.* 5½*d.* Accounts are kept *in* reis; 1,000 are called mille reis, and 1,000,000 reis are called a conto. In the notation of accounts, the mille reis are separated from the reis by the following sign $, thus a sovereign 4,500 is 4 $ 500.

The old crusado is 400, the new crusado 480 reis. 100 reis are called tostao, (plural tostoes), 20 reis is called a vintem (plur. vintens). The 8,000 pieces are denominated "peças." The actual rates (1855) of exchange on England 54½*d.* per mille reis at 3 *m.* | *d.* Paris, 530 reis per 3 francs, 100*d.* | *d.* Hamburgh 38½ *d.* per mille reis 3 *m.* | *d.* Amsterdam, 43 florins per 16 mille reis, 3 *m.* | *d.*; and Genoa, 528 reis per lira nuova, 3 *m.* | *d.* Bills drawn in foreign coin, without any declared exchange, are payable in Portugal at the *usu* exchange at maturity. The uso is 30 *d.* | *s.* for England, 100 *d.* | *d.* for France, and 3 *m.* | *d.* for Hamburgh, Holland, and Genoa. There are no direct exchange operations on other places besides these, excepting Spain, the price of the dollar varying from 920 to 960 reis.

Weights and Measures.—The French system has been adopted by government, but has not yet been carried into execution, excepting by official employés in measurements of land. Commercial Weights.—The *arvatel*, libra, or pound = 2 marcos = 4 quarteis = 16 onças = 128 outavas = 7,084 Eng. grains. 32 arratels, or 1 a. = 1 arroba; 4 arrobas = 1 quintal; and 1¾ quintals, or 54 arrobas = 1 tomelada or ton. 100 Portuguese lbs. = 101·19 (101½ nearly) lbs. avoirdupois = 45·89 kilog.

The measure by which corn, salt, and dry vegetables are principally sold is the *moio* or *muyo* = 15 fangas = 60 alqueires = 240 quartos = 480 outavas = 9·79 (rather more than 9¾) imp. quarters. The weight of a moyo of corn depends, of course, on the quality of the grain. A moyo of salt may be taken at about 1600 lbs.

The principal liquid measure, the *almude*=3,641 imp. gallons, is divided into 2 potes or cantaros, 12 canadas, and 48 quartilhos. A pipe in the S. provinces=96 almudes; in Lisbon for shipment it is 30 almudes=109·23 (109¼ nearly) imp. gall.

Measures of length, 1 pe = 1¼ palmo = 12·95 Eng. inch; 3 palmos=1 covado; 5 palmos=1 vara; 2 varas, or 10 palmos = 1 braça. A yard is reckoned equal to 4 palmos; a metre, to 4½ palmos.

The weights are uniform throughout Portugal; the measures vary almost from one parish to another.—(*Dourthez, Dictionnaire Universel, voce* ARROBA, *&c.*; *Kelly's Cambist*, art. LISBON, *&c.*

Bank of Lisbon, now called Bank of Portugal, was founded in Nov. 1846, being a reintegration of the old bank founded in 1822. Its capital is 1,780,000*l.*, in shares of about 22*l.* and 110*l.* Its rate of discount is invariably 5 per cent. per annum for bills not having more than 3 months to run.

It has the privilege of issuing notes, and, which is more valuable, of having its claims on estates paid in full, provided the estate amounts to so much! This privilege, which is justly obnoxious, allows it to be more liberal, or less cautious in discounting than it would be otherwise. It is bound to publish monthly statements of its situation, but, like the majority of such documents, they are drawn out so that it is impossible to make anything satisfactory out of them. From those of *July, 1855*, it appears that the notes in circulation were 206,600*l.*; deposits, 553,500*l.*; cash, 383,400*l.*; bills discounted, 325,200*l.*

Commission.—Portuguese houses generally charge 3 per cent.; foreign houses 2½ per cent. , *del credere* ½ per cent. per month.

According to the Portuguese laws agents are obliged to effect insurance on shipments, unless they have orders to the contrary.

Brokerage, ½ per cent. for bills, ¼ per cent. for funds and goods, payable by buyer and seller; for grain 400 reis per moyo (about 8*d.* per quarter) is paid; for butter and sometimes for rice 1 per cent. is charged.

Customary Tares.—Annatto, single baskets 1½ lb. each, draft 2 lb. per 320 lb.; cotton, ½ lb. per bag, draft 2 lb. per 5 bags; coffee, linen bag, 1½ lb., cotton do. 1 lb. each, draft 2 lb. per 5 bags; cocoa, like coffee. Copahiba oil in tin canisters, 2 lb. each, draft 2 lb. per 320 lb.; in barrels it is measured; Indian rubber (caoutchouc), 2 lb. per bundle, draft 2 lb. per 320 lbs.; gum, 1 lb. per basket, draft as above: tapioca, 20 lb. per barrel, draft as above; sugar, general tare, 7 to 8 arrobas per box, draft 2½ lb., barrel 18 lb. to 20 lb., draft 2 lb.; bags, invariable tare, 2 lb. per bag, draft 2 lb. per 5 bags.

Tea, per chest, 15 to 24 lbs. according to size; cinnamon, 12 lb. per box, pepper, 2 lb. per bag; rice, 1 lb., draft as above. Oil is now sold by weight, 34 lb. per almude (66 almudes are reckoned to the tun) and real tares of casks allowed. All goods for exportation must be accompanied on board by a custom-house permit.

Warehousing.—The custom-house has spacious stores, where all goods, except inflammatory ones, such as pitch and tar, are

allowed to remain, free of expense, for 12 months; raw cotton, sugar, coffee, cinnamon, tea, hides, pepper, sarsaparilla, saltpetre and tobacco may remain for 24 months. After these periods the rent is 20 reis per 128 lbs. for dry goods, and 16 reis per almude for liquids. All labour in the custom-house is done by its workmen, for which 85 reis per 128 lbs. gross weight is charged. Lisbon possesses an Industrial Institute, where artisans (400 in 1855) are instructed in arts and trades. It has 47 manufactories moved by steam engines of 722 horse-power, and 68 by manual labour. The latter employ 4,769 workmen.

On sale of goods, credits varying from 3 to 6 months are allowed; export goods are usually paid by cash. (Compiled from private information, obtained from the best sources, direct from Lisbon.)

Trade of the U. Kingdom with Portugal.—We subjoin

An Account of the Quantities and computed Values of the Principal Articles Imported into the U. K. from Portugal in 1856 and 1857.

Articles.		Quantities.		Values.

LITERARY PROPERTY. See Books.

LITHARGE (Ger. *Glötte, Glätte*; Du. *Gelit*; Fr. *Litharge*; It. *Litargirio*; Sp. *Almartaga, Litarjirio*; Rus. *Glet*; Lat. *Lithargyrium*), an oxide of lead in an imperfect state of vitrification.

Most of the lead met with in commerce contains silver, from a few grains to 30 ounces or more in the fodder: when the quantity is sufficient to pay the expense of separation, it is *refined*; that is, the metal is exposed to a high heat, passing at the same time a current of air over the surface; the lead is thus oxidised and converted into *litharge*, while the silver, remaining unchanged, is collected at the end of the process.—(*Thomson's Chemistry, &c.*) Litharge is used for various purposes in the arts, by potters, glass makers, painters, &c.

LIVERPOOL DOCKS, SHIPPING, &c. See antè p. 514.

LOADSTONE (Ger. *Magnet*; Du. *Magneet*; Fr. *Aimant*; It. *Calamita*; Sp. *Iman*; Rus. *Magnit*; Lat. *Magnes*).

M. Haüy observes, that the ores in which the iron contains the least oxygen without being engaged in other combinations, form natural magnets; and he calls the *loadstones* of commerce, which are found in considerable masses in Germany, Sweden, Norway, Spain, Italy, China, Siam, the Philippine Isles, Corsica, and Ethiopia, *oxidulated iron*. The loadstone is characterised by the following properties:—A very strong action on the magnetic needle. Specific gravity 4·2457. Not ductile. Of a dark grey colour, with a metallic lustre.—Primitive form, the regular octahedron. Insoluble in nitric acid.

This singular substance was known to the ancients, and they had remarked its peculiar property of attracting iron; but it does not appear that they were acquainted with the wonderful property which it also has, of turning the pole when suspended, and left at liberty to move freely. Upon this remarkable circumstance the mariner's compass depends, an instrument which gives us such infinite advantages over the ancients. It is this which enables the mariner to conduct his vessel through vast oceans out of the sight of land, in any given direction; and this directive property also guides the miner in subterranean excavations, and the traveller through deserts otherwise impassable. The natural loadstone has also the quality of communicating its properties to iron and steel; and when pieces of steel properly prepared are touched, as it is called, by the loadstone, they are denominated artificial magnets.—(See COMPASS.)

LOBSTER (Fr. *Ecrevisse*; Lat. *Cancer*), a fish of the crab species, of which vast quantities are consumed in London.

The minimum size of lobsters offered for sale is fixed by 10 & 11 Will. 3. c. 24., at *eight* inches from the tip of the nose to the end of the middle fin of the tail. No lobsters are to be taken on the coast of Scotland between the 1st of June and the 1st of September, under a penalty of 5*l*. The Scilly Islands and the Land's End abound in lobsters, as well as several places on the Scottish shores, particularly about Montrose. But the principal lobster fishery is on the coast of Norway; whence it is believed about 1,000,000 lobsters are annually imported into London. Those of Heligoland are, however, esteemed the best; they are of a deeper black colour, and their flesh is firmer than those brought from Norway. Turbots and lobsters may be imported either in British or foreign vessels free of duty.

LOCK, LOCKS (Ger. *Schlösser;* Du. *Sloten;* Fr. *Serrures;* It. *Serrature;* Sp. *Cerraduras, Cerrajos;* Rus. *Samki*), a well known instrument, of which there are infinite varieties. A great deal of art and delicacy is sometimes displayed in contriving and varying the wards, springs, bolts, &c., and adjusting them to the places where they are to be used, and to the occasions of using them. From the various structure of locks, accommodated to their different intentions, they acquire various names, as stock locks, spring locks, padlocks, &c. Wolverhampton was, at a very early period, famous for the superior skill and ingenuity of its locksmiths; but the best locks are now made in London and Birmingham. The grand difficulty to be overcome in making a lock is to construct it so that it may not be opened by any key except its own, nor admit of being picked; it should also be possessed of sufficient strength and durability, and not be too complex. Many ingenious contrivances have been proposed for the attainment of the desired security, several of which are possessed of much merit. And though we believe that no lock has hitherto been constructed that may not (if proper facilities are given) be picked; yet it is true that some of the best locks, such as those made by Messrs. Bramah, Chubb, Mordan, and other first-rate artists, are so very difficult to pick, that the security which they afford may, in a practical point of view, be regarded as all but perfect. Common door-locks are now usually inserted in the wood, instead of being, as formerly, screwed to it; and when so placed are called *mortis* locks.

LOG (SHIP'S), Fr. *Loc;* a piece of timber, usually of a fish-like or quadrantal shape, so constructed and balanced, by being loaded at one end, as to swim perpendicularly on the surface of the water. It has a line attached to it, and is employed in ships to ascertain the rate of sailing. The log-line is divided into spaces, or knots, which, if properly measured, bear the same proportion to a marine mile that $\frac{1}{2}$ minute bears to an hour. On throwing the log into the sea it remains stationary, or nearly so; and the log-line being drawn out, or unwound from its reel, by the ship proceeding on her course, her speed is estimated by observing the number of knots, each of which represents a mile, run out in $\frac{1}{2}$ minute as measured by a $\frac{1}{2}$ minute sand-glass. Hence, if 3, 4, or 5 knots are run out in $\frac{1}{2}$ minute, the rate of sailing is 3, 4, or 5 miles an hour as the case may be; and hence, also, the custom of stating a ship's rate of sailing in knots instead of miles. N. B. A great variety of logs have been suggested; but the principle being the same in them all, it is needless to enter into any particulars with respect to their construction.

From the log being affected by currents and other disturbing causes, the results obtained by its means have usually to be subjected to various corrections; and, except under favourable circumstances, are but little to be depended on. Whenever, therefore, an opportunity offers, the true place of the ship should be determined by observation. But in hazy weather, or when observations cannot be taken, and in narrow seas, the log, when carefully used, may be of the greatest service; and it should never be wholly dispensed with.

LOG-BOOK, (Fr. *Livre du Loc*). This, which is, in fact, the ship's journal, derives its name from the circumstance of the *dead reckoning*, or the results obtained by heaving the log compared with the ship's course, being usually given in it. In its present improved state, the log-book comprises an account of every event of any importance that takes place during a voyage, whether relating to the ship, the crew, the passengers (if any), or the cargo, which should be taken down as soon as possible after its occurrence. Inasmuch, too, as it is of the highest importance in all matters relating to the voyage, the log-book should be carefully and faithfully compiled, and made out in a clear and distinct manner. This, indeed, is one of the principal duties of a master.

LOG (OFFICIAL). In addition to, or in conjunction with the ordinary ship's log, all masters of British ships, not wholly engaged in the coasting trade, are bound to keep an *official log*, in such form as may, from time to time, be prescribed by the Board of Trade. The entries to be made in this log are specified in the Mercantile Shipping Act of 1854, as follows, viz.

Official Logs to be kept in Forms sanctioned by B. of T.—The B. of Trade shall sanction forms of official log books, which may be different for different classes of ships, so that each such forms contains blanks for the entries herein-after required; and an official log of every ship (except ships employed exclusively in trading between ports on the coasts of the U. K.) shall be kept in the appropriate sanctioned form; and such official log may, at the discretion of the master or owner, either be kept distinct from the ordinary ship's log or united therewith, so that in all cases all the blanks in the official log be duly filled up. — § 280.

Entries to be made in due Time.—Every entry in every official log shall be made as soon as possible after the occurrence to which it relates, and if not made on the same day as the occurrence to which it relates shall be made and dated so as to show the date of the occurrence and of the entry respecting it; and in no case shall any entry therein in respect of any occurrence happening previously to the arrival of the ship at her final port of discharge be made more than 24 hours after such arrival.—§ 281.

Entries required in Official Log.—Every master of a ship for which an official log book is hereby required shall make or cause to be made therein entries of the following matters; (that is to say,)

(1.) Every legal conviction of any member of his crew, and the punishment inflicted:

(2.) Every offence committed by any member of his crew for which it is intended to prosecute, or to enforce a forfeiture, or to exact a fine, together with such statement concerning the reading over such entry, and concerning the reply (if any) made to the charge, as herein-before required:

(3.) Every offence for which punishment is inflicted on board, and the punishment inflicted:

(4.) A statement of the conduct, character, and qualifications, of each of his crew, or a statement that he declines to give an opinion on such particulars:

(5.) Every case of illness or injury happening to any member of the crew, with the nature thereof, and the medical treatment adopted (if any):

(6.) Every case of death happening on board, and of the cause thereof:

(7.) Every birth happening on board, with the sex of the infant and the names of the parents:

(8.) Every marriage taking place on board, with the names and ages of the parties:

(9.) The name of every seaman or apprentice who ceases to be a member of the crew, otherwise than by death, with the place, time, manner, and cause thereof:

(10.) The amount of wages due to any seaman who enters Her Majesty's service during the voyage:

(11.) The wages due to any seaman or apprentice who dies during the voyage, and the gross amount of all deductions to be made therefrom:

(12.) The sale of the effects of any seaman or apprentice who dies during the voyage, including a statement of each article sold, and of the sum received for it:

(13.) Every collision with any other ship, and the circumstances under which the same occurred.—§ 282.

Entries how to be signed.—The entries to be made in official log books shall be signed as follows; viz.:—Every such entry shall be signed by the master and by the mate or some other of the crew, and every entry of illness, injury, or death shall be also signed by the surgeon or medical practitioner on board (if any); and every entry of wages due to or of the sale of the effects of any seaman or apprentice who dies shall be signed by the master and by the mate and some other member of the crew; and every entry of wages due to any seaman who enters H. M.'s service shall be signed by the master, and by the seaman or by the officer authorised to receive the seaman into such service.—§ 283.

Penalties in respect of official Logs.—The following offences in respect of official log books shall be punishable as herein-after mentioned; viz.:—

(1.) If in any case an official log book is not kept in the manner hereby required, or if any entry hereby directed to be made in any such log book is not made at the time and in the manner hereby directed, the master shall for each such offence incur the specific penalty herein mentioned in respect thereof, or where there is no such specific penalty, a penalty not exceeding 5*l.*

(2.) Every person who makes or procures to be made or assists in making any entry in any official log book in respect of any occurrence happening previously to the arrival of the ship at her final port of discharge more than twenty-four hours after such arrival shall for each such offence incur a penalty not exceeding 30*l.*

(3.) Every person who wilfully destroys or mutilates or renders illegible any entry in any official log book, or who wilfully makes or procures to be made or assists in making any false or fraudulent entry or omission in any such log book, shall for each such offence be deemed guilty of a misdemeanor.—§ 284.

Entries in official Logs to be received in Evidence.—All entries made in any official log book as herein-before directed shall be received in evidence in any proceeding in any court of justice, subject to all just exceptions.—§ 285.

Official Logs to be delivered to Shipping Master.—In the case of foreign-going ships the master shall, within 48 hours after the ship's arrival at her final port of destination in the U. K., or upon the discharge of the crew, whichever first happens, deliver to the shipping master before whom the crew is discharged the official log book of the voyage; and the master or owner of every home trade ship, not exclusively employed in trading between ports on the coasts in the U. K. shall within 21 days after the 30th of June and the 31st of December in every year transmit or deliver to some shipping master in the U. K. the official log book for the preceding half year; and every master or owner who refuses or neglects to deliver his official log book as hereby required shall be subject to the same consequences and liabilities to which he is hereby made subject for the non-delivery of the list of his crew.—§ 286.

Official Logs to be sent home in case of Transfer of Ship, and in case of Loss.—If any ship ceases by reason of transfer of ownership or change of employment to fall within the definition of a foreign-going or of a home trade ship, the master or owner thereof shall if such ship is then in the U. K., within 1 month, and if she is elsewhere, within 6 months, deliver or transmit to the shipping master at the port to which the ship belonged the official log book (if any) duly made out to the time at which she ceased to be a foreign-going or home trade ship, and in default shall for each offence incur a penalty not exceeding 10*l.*; and if any ship is lost or abandoned, the master or owner thereof shall, if practicable, and as soon as possible, deliver or transmit to the shipping master at the port to which the ship belonged the official log book (if any) duly made out to the time of such loss or abandonment, and in default shall for each offence incur a penalty not exceeding 10*l.*—§ 287.

LOGWOOD (Fr. *Bois de Campèche*; Ger. *Kampescholz*; Du. *Campecheout*; Sp. *Palo de Campeche*), the wood of a tree (*Hæmatoxylon Campechianum* Lin.), a native of America, and which attains the greatest perfection at Campeachy, and in the West Indies. It thrives best in a wet soil, with a large proportion of clay. The logwood tree is like the white thorn, but a great deal larger. The wood is hard, compact, heavy, and of a deep red colour internally, which it gives out both to water and alcohol. It is an article of great commercial importance, being extensively used as a dye wood. It is imported in logs, that are afterwards chipped.—(The logwood tree, and the adventures of those that were formerly engaged in cutting it, are described by Dampier; see his *Voyages*, vol. ii. part 2. p. 56. ed. 1729.)

The imports of logwood amounted at an average of the years 1851 and 1852 to 20,454 tons a year, and the re-exports to 2,617 tons a year. Of the imports, in 1852, about 10,000 tons came from Honduras, the British W. Indies, and Guiana; 4,775 tons from Mexico; 3,197 tons from the U. States; and 1,050 tons from Hayti. Its price in Liverpool, in 1854, varied from 5*l.* to 7*l.* 10*s.* a ton. It was made duty free in 1845.

We borrow from the learned and able work of Dr. Bancroft, the following curious

details with respect to the use of logwood in this country: — "Logwood seems to have been first brought to England soon after the accession of Queen Elizabeth: but the various and beautiful colours dyed from it proved so fugacious, that a general outcry against its use was soon raised; and an act of parliament was passed in the 23d year of her reign, which prohibited its use as a dye under severe penalties, and not only authorised but directed the *burning* of it, in whatever hands it might be found within the realm; and though this wood was afterwards sometimes clandestinely used (under the feigned name of blackwood), it continued subject to this prohibition for nearly 100 years, or until the passing of the act 13 & 14 Chas. 2.; the preamble of which declares, that the ingenious industry of modern times hath taught the dyers of England the art of fixing colours made of logwood, *alias* blackwood, so as that, by experience, they are found as lasting as the colours made with *any other sort of dyeing wood whatever*; and on this ground it repeals so much of the statute of Elizabeth as related to logwood, and gives permission to import and use it for dyeing. Probably the solicitude of the dyers to obtain this permission, induced them to pretend that their industry had done much more than it really had, in fixing the colours of logwood; most of which, even at this time, are notoriously deficient in regard to their durability"—(*On Permanent Colours*, vol. ii. p. 340.)

LOUIS D'OR, a French gold coin, first struck in 1640. It was subsequently made by the French mint regulations equal to 24 livres, or 1*l.* sterling. This, however, was under-rating it in respect of silver; and hence, as every one preferred paying his debts in the over-valued coin, silver became the principal currency of France, the gold coins being either sent to the melting-pot or exported. In Britain, the process was reversed. Gold having been, for a lengthened period, over-valued by our mint in respect to silver, it became the principal currency of the country.

M.

MACAO, a sea-port and settlement belonging to the Portuguese, on the island of the same name, at the mouth of the Canton river in China, in lat. 22° 12′ 45″ N., lon. 113° 35′ E. The situation of Macao strikingly resembles that of Cadiz. It is built near the extremity of a peninsula projecting from the south-west corner of the island of Macao, to which it is joined by a long narrow neck. Across this isthmus, which is not more than 100 yards wide, a wall is erected, with a gate and guard-house in the middle for the Chinese soldiers. The greatest length of the peninsula belonging to the Portuguese, from N. E. to S. W., is under 3 miles, and its breadth under ½ mile. The broadest part, to the north of the town, is flat, and of a light sandy soil; but is well cultivated, principally by Chinese, and produces all sorts of Asiatic and European culinary vegetables. Provisions are obtained from the Chinese part of the island or from the main land; and whenever the Portuguese do any thing to offend the Chinese authorities, the provisions are cut off till they are obliged quietly to submit. They are seldom allowed to pass beyond the narrow precincts of the territory assigned to them. The population of the peninsula may amount to from 12,000 to 13,000, of whom considerably more than half are Chinese. The functionaries belonging to the East India Company's factory at Canton resided here during the whole of the dead season.

The Portuguese obtained possession of Macao in 1586. It was for a considerable period the seat of a great trade, carried on not only with China, but with Japan, Siam, Cochin-China, the Philippine Islands, &c.; but for these many years past it has been of comparatively little importance, though it is probable, that if it belonged to a more enterprising and active people, it might still recover most part of its former prosperity. The public administration is vested in a senate composed of the bishop, the judge, and a few of the principal inhabitants; but all real authority is in the hands of the Chinese mandarin resident in the town.

The Harbour is on the west side of the town, between it and Priest's Island; but the water in it not being sufficiently deep to admit large ships, they generally anchor in the roads on the other side of the peninsula, from 5 to 10 miles E.S.E. from the town. All vessels coming into the roads send their boats to the Portuguese Custom-house on the south side of the town.

When a ship arrives among the islands, she is generally boarded by a pilot, who carries her into Macao roads. As soon as she is anchored, the pilot proceeds to Macao to inform the mandarin of the nation she belongs to. If there be any women on board, application must be made to the bishop and senate, for leave to send them on shore, as they will not be permitted to proceed *to* Whampoa in the ship. As soon as the mandarin has made the necessary inquiries, he orders off a river pilot, who brings with him a *chop* or licence to pass the Bocca Tigris, or mouth of the Canton river, and carries the ship to Whampoa.

Trade of Macao. — The Chinese regulations do not permit any vessels, except such as belong to Portuguese or Spaniards, of which there are very few, to trade at Macao. But the Portuguese inhabitants lend their names, for a trifling consideration, to such foreigners as wish to be associated with them for the purpose of trading from the port. Independently, however, of this, vessels of other nations usually experience no difficulty in obtaining the connivance of the Chinese officers to the landing or receiving of goods in the roads, by means of Portuguese boats. At intervals, indeed, the prohibitory regulation is strictly enforced; but we believe that there has been no instance of this for the last 3 years.

Vessels of other nations, if in distress, and not engaged in the contraband trade, are admitted into the harbour for repairs, on application to the senate.

Port Charges.—The measurement duty paid by Spanish and Portuguese vessels is moderate. When a vessel has once paid the full amount, and is admitted on the list of registered ships belonging to the port (limited by the Chinese to 25), she is liable only to a third of the original charges, on every subsequent occasion of her entering, so long as she continues on the register. Portuguese vessels from Europe do not possess this privilege, unless they be registered as belonging to a morador of Macao.

The rates of measurement duty, which vary as at Canton, (which see), on three classes of vessels, are the following:—

		Taels.
1st.	On vessels of 154 covids and upwards,	6·223 per covid.
2d.	— from 120 to 154	5·72 —
3d.	— from 90 to 120 covids	4 —

These rates are nearly the same as those levied on Canton junks, trading with foreign countries, and ought, in fact, to be entirely so. The dimensions are taken and calculated in the manner formerly practised at Canton; but the Chinese, at both places, speak not of the covid, but of the chang of 10 covids. However, as this is only a decimal increase, it makes no difference in the method of calculation.

The following additional charges, to be calculated on the amount of measurement duty, are the same on every class of vessels, viz

2 per cent. for inspectors.
8 — for difference in weight by the treasury scales.
10 — for loss in melting.
17 — for making sycee.

Also the sum of 70 taels for the "public purse," or hoppo's treasury.

In addition to these, the following are the charges levied by the hoppo (collector of customs), or his deputy:—

On a 1st class vessel from Europe, 250 taels; if belonging to Macao or Manilla, 50 taels.

On a 2d class vessel from Europe, 240 taels; if belonging to Macao or Manilla, 40 taels.

On a 3d class vessel from Europe, 170 taels; if belonging to Macao or Manilla, 30 taels.

Ships importing rice are exempt from the measurement duty, and pay only 50 dollars, as fees to the procurador of Macao and the officers of his department.

Portuguese vessels from Europe, in addition to the measurement duty, have to pay to the Canton hong merchants a charge, termed by the Portuguese, Hanistagem, or Consoo charge, which is usually a matter of specific bargain, varying from about 200 dollars on a vessel of 200 tons, to 3,500 dollars and upwards on those of 500 tons, and of larger sizes.

The charges on goods carried by the inner passage, between Canton and Macao, being generally less than those paid on goods to and from Whampoa; and the duties levied by the Portuguese, on articles of merchandise imported by vessels belonging to Macao, being very moderate; the Chinese are often led to engage in speculations on board the Macao vessels, the risk being so much less than in native junks. If the ship owners could manage their expenses so as to be satisfied with only the same freight as is charged by English vessels, it would probably induce many more Chinese to make remittances in this way.

Opium.—The trade in opium is prohibited at Macao by the Chinese government, as well as throughout the rest of the empire. It was, nevertheless, formerly carried on to a great extent by the Portuguese moradores, or citizens, to the exclusion of all others, even Portuguese who were not citizens. But this restriction having occasioned the decline of the trade, it was abolished in 1833, when the senate passed a regulation throwing open the trade to all, without distinction, whether Portuguese or foreigners; securing to the latter, "hospitality and the utmost freedom in their speculations." At present, however, very little opium is imported, in consequence, it is said, of the heavy bribes demanded by the Chinese officers, to insure their connivance. The trade is now principally carried on at Lintin, about 30 miles from Macao.

Imports.—Goods imported pay at the Portuguese Custom-house a duty of 6 per cent. on a fixed valuation, besides some fees, and coolie hire. The following are a few articles extracted from the tariff:—

		Valuation. *Taels.*	Duty. *Taels.*
Cotton	per picul	4	0·240
Broad cloth, middling	covid	1·600	0·096
better than ordinary	—	0·800	0·048
ordinary or course	—	0·480	0·028
Camlets	—	1·280	0·076
Betel nut	picul	1·200	0·072
Tin	—	8	0·480
Birds' nests, 1st sort	catty	22·400	1·341
Rattans	picul	1·200	0·072
Saltpetre, Bengal	—	4	2·240
coast of Goa	—	1·600	0·096
Pepper	—	4	0·240

Opium imported in Portuguese ships, pays per chest, drs. 10½.
Do. foreign do. — 15½.

Gold and silver, whether in coin, in bullion, or manufactured, pay on importation, 2 per cent.; except in Spanish vessels from Manilla, when the charge is 1½ per cent.

Exports.—No duty is levied by the Portuguese on goods exported from Macao; nor does the Custom-house take any cognizance of them.

Duties and Charges on Goods landed at Macao.—Macao is a place without any manufactures or commerce of its own. Prices are, in consequence, generally dependent on those of Canton. Money is usually paid at 72 taels per 100 dollars.

It is a point of some interest to ascertain the internal duties and expenses to which goods landed at Macao are liable, before coming into the Chinese purchaser's hands at Canton. But the subject is so involved in mystery and uncertainty, the charges varying according to the quantity of goods laden in one boat, &c., that it is scarcely possible to arrive at any accurate information respecting it. We believe, however, that the following may be considered as a pretty close approximation to the real amount of charges incurred on cotton landed at Macao:—

Portuguese duty, fees, &c.	mace,	2—6 per picul.
Duties and charges on conveyance to Canton		6—3
Canton charges, difference of weight, brokerage on sale, &c.		8—0
Total, about taels,		2—6—9

The duties and charges on conveyance from Macao to Canton are, for pepper, per picul — mace, 9—0
Rattans — — 4—5
Betel nut — — 4—5

The hoppo's examiner charges 90 taels per boat of 1,000 piculs, the largest quantity allowed to be conveyed by a single boat; but the same charge of 90 taels is levied, although the boat should only contain 100 piculs.

The duty on exporting goods from Canton to Macao is in some cases less, in other cases greater, than the Whampoa duty. Thus, nankeens to Macao pay 2 dollars per 100 less than to Whampoa. Most descriptions of silk piece goods also pay less duty. On the other hand, tea, paper, China ware, &c. pay a higher duty to Macao than to Whampoa.

For details as to the *Weights, Measures, &c.* used at Macao, see CANTON.

For further particulars, see *Hamilton's East India Gazetteer*, art. *Macao*; *Milburn's Orient. Com.*; and the *Anglo-Chinese Kalendar and Companion to the Almanac*, Macao, 1852.

MACCARONI, a species of wheaten paste formed into long, slender, hollow tubes, used amongst us dressed with cheese, and in soups, broths, &c.

Maccaroni is the same substance as vermicelli; the only difference between them being that the latter is made into smaller tubes. Both of them are prepared in the greatest perfection in Naples, where they form the favourite dish of all classes, and the principal food of the bulk of the population. The flour of the hard wheat (*grano duro*) imported from the Black Sea is the best suited for the manufacture of maccaroni. Being mixed with water, it is kneaded by means of heavy wooden blocks wrought by levers, till it acquires a sufficient degree of tenacity; it is then forced, by simple pressure, through a number of holes, so contrived that it is formed into hollow cylinders. The name given to the tubes depends on their diameter; those of the largest size being maccaroni, the next to them vermicelli, and the smallest fedelini. At Genoa, and some other places, the paste is coloured by an admixture of saffron; but at Naples, where its preparation is best understood, nothing is used except flour and water; the best being made of the flour of hard wheat, and the inferior sorts of the flour of soft wheat. When properly prepared and boiled to a nicety, Neapolitan maccaroni assumes a greenish tinge. It is then taken out of the caldron, drained of the water, and being saturated with concentrated meat gravy, and sprinkled with finely grated cheese, it forms a dish of which all classes, from the prince to the beggar, are passionately fond. But the maccaroni used by the poor is merely boiled in plain water, and is rarely eaten with any condiment whatever. The maccaroni usually served up in England is said, by those familiar with that of Naples, to be a disgrace to the name it bears. When properly prepared, maccaroni is nutritious and easy of digestion. The lazzaroni pique themselves on the dexterity with which they swallow long strings of maccaroni and

vermicelli without breaking them. (We are principally indebted for these details to an article on maccaroni in the *Penny Magazine* for the 10th of August, 1833.)

MACE (Ger. *Macis, Muskatenbluthe;* Du. *Foelie, Foely, Muscaatbloom;* Fr. *Macis, Fleur de muscade;* It. *Mace;* Sp. *Macio;* Port. *Maxcis, Flor de noz moscada;* Lat. *Macis*), a thin, flat, membranous substance, enveloping the nutmeg; and consequently only to be found in the countries that produce the latter. It is of a lively, reddish yellow colour, a pleasant aromatic smell, and a warm, bitterish, pungent taste. Mace should be chosen fresh, tough, oleaginous, of an extremely fragrant smell, and a bright colour—the brighter the better. The smaller pieces are esteemed the best. The preferable mode of packing is in bales, pressed down close and firm, which preserves its fragrance and consistence.

The duty on mace was reduced in 1853 from 2*s.* 6*d.* to 1*s.* per lb. In 1857, 116,293 lbs. were imported, of which 24,168 lbs. were entered for consumption.

A production is met with on the coast of Malabar, so like mace, that at first it is not easy to be distinguished; but it has not the least flavour of spiciness, and when chewed has a kind of resiny taste. Eight cwt. of mace are allowed to a ton.—(*Milburn's Orient. Com.*)

MADDER (Ger. *Färberöthe;* Du. *Mee;* Fr. *Alizari, Garance;* It. *Robbia;* Sp. *Granza, Rubia;* Rus. *Mariona, Krap;* Hind. *Munjith*), the roots of a plant (*Rubia tinctorum*), of which there are several varieties. They are long and slender, varying from the thickness of a goose-quill to that of the little finger. They are semi-transparent, of a reddish colour, have a strong smell, and a smooth bark. Madder is very extensively used in dyeing red; and though the colour which it imparts be less bright and beautiful than that of cochineal, it has the advantage of being cheaper and more durable. It is a native of the south of Europe, Asia Minor, and India; but has been long since introduced into and successfully cultivated in Holland, Alsace, Provence, &c. Its cultivation has been attempted in England, but without any beneficial result. Our supplies of madder were for a lengthened period almost entirely derived from Holland (Zealand); but large quantities are now imported from France and Turkey.

Dutch or Zealand madder is never exported except in a prepared or manufactured state. It is divided by commercial men into four qualities, distinguished by the terms *mull, gamen, ombro,* and *crops.* The roots being dried in stoves, the first species, or mull, consists of a powder formed by pounding the very small roots, and the husk or bark of the larger ones. It is comparatively low priced, and is employed for dyeing cheap dark colours. A second pounding separates about a third part of the larger roots; and this, being sifted and packed separately, is sold here under the name of gamene, or gemeens. The third and last pounding comprehends the interior, pure, and bright part of the roots, and is sold in Holland under the name of *kor kraps*, but is here simply denominated crops. Sometimes, however, after the mull has been separated, the entire residue is ground, sifted, and packed together, under the name of *onberoofde*, or ombro. It consists of about one third of gamene, and two thirds of crops. Prepared madder should be kept dry. It attracts the moisture of the atmosphere, and is injured by it.

The Smyrna or Levant madder (*Rubia peregrina*), the alizari or lizary of the modern Greeks, is cultivated in Bœotia, along the border of lake Copais, and in the plain of Thebes. It also grows in large quantities at Kurdar near Smyrna, and in Cyprus. The madder of Provence has been raised from seeds carried from the latter in 1761. Turkey madder affords, when properly prepared, a brighter colour than that of Zealand. It is, however, imported in its natural state, or as roots: the natives, by whom it is chiefly produced, not having industry or skill sufficient to prepare it like the Zealanders, by pounding and separating the skins and inferior roots; so that, the finer colouring matter of the larger roots being degraded by the presence of that derived from the former, a peculiar process is required to evolve that beautiful Turkey red which is so highly and deservedly esteemed.—(*Thomson's Chemistry; Bancroft on Colours*, vol. ii. pp. 221—278.: see also *Beckmann, Hist. of Invent.* vol. iii. art. *Madder.*)

In France, madder is prepared nearly in the same manner as in Zealand. The following instructive details as to its cultivation, price, &c. in Provence, were obligingly furnished to us by an English gentleman, intimately acquainted with such subjects, who visited Avignon in the autumn of 1829:—

"This town (Avignon) is the centre of the madder country, the cultivation of which was introduced here about the middle of the 18th century, and, with the exception of Alsace, is still confined (in France) to this department (Vaucluse). The soil appears to be better adapted for its cultivation here than anywhere else, and it has long been the source of great wealth to the cultivators. But the returns fluctuate very greatly.

"The root is called *alizari*, and the powder (made from it) *garance*, or *garancine*. The plant is raised from seed, and requires 3 years to come to maturity. It is, however, often pulled in 18 months without injury to the quality; the quantity only is smaller. A rich soil is necessary for its successful cultivation; and when the soil is impregnated with alkaline matter, the root acquires a red colour; in other cases it is yellow. The latter is preferred in England, from the long habit of using Dutch madder, which is of this colour; but in France the red sells at 2 fr. per quintal higher, being used for the Turkey red dye.

"It is calculated that when wheat sells at 20 fr. per hectolitre, *alizari* should bring 35 fr. per quintal

(poids de table), to give the same remuneration to the cultivator. That is, wheat 63*s.* per Eng. quarter, and *alizari* 34*s.* per Eng. cwt. The price has, however, been frequently as low as 22 fr. per quintal.

"Prices undergo a revolution every 7 or 8 years, touching the minimum of 22, and rising as high as 100 fr. As in every similar case, the high price induces extensive cultivation, and this generally produces its full effect 4 or 5 years after. The produce of Alsace, which is inferior both in quantity and quality to that of Vaucluse, is generally sold in Strasburg market.

"England employs both the root and the powder, according to the purpose for which they are intended. The Dutch madder is more employed by the woollen dyers, and the French by the cotton dyers and printers.

"In making purchases of *garance*, it is essential to employ a house of confidence, because the quality depends entirely upon the care and honesty of the agent. The *finest* is produced from the roots after being cleaned and stripped of their bark. The *second* by grinding the roots without cleaning. A *third* by mixing the bark of the *first* while grinding; and so on to any degree of adulteration.

"The price of *alizari* in the country, which was only 25 fr. in July, is now (November, 1829) at 36 fr., and is expected to be at 40 fr. very shortly. The crop being deficient both here and in Holland, and the certainty of its being also deficient next year, added to the small quantity existing in England, give reason to believe that the price will reach 60 fr. before many months, and will continue to advance for a year or two more.

"The *quintals* above mentioned are of 100 lbs. *poids de table*—the weight in general use over the south of France, and even in *Marseilles*. This weight is different in the different provinces, varying from 22 to 25 per cent. lighter than the *poids métrique*. At Avignon, 124 p. de tables=50 kilog., consequently 126 lbs. are equal to 1 cwt. Eng. At the exchange of 25 50 the cwt. costs (including 11*s.* for freight, duty, and all charges till delivered in London or Liverpool), 61*s.* or 60*s.*"

The duty on madder was repealed in 1845.

Madder does not deteriorate by keeping, provided it be kept dry.

Account of the Quantities and Values of the different varieties of Madder imported in 1857, showing the Countries whence they came, and the Total Value of the Imports from each Country.

Countries.	Madder.	Madder Root.	Garancine.	Total Quantities.	Total Values.

During the same year 1,143 cwt. madder, and 11,152 cwt. madder root were exported.

In 1857 the garancine imported was valued at 7*l.* 8*s.* a cwt., and the madder and madder roots at from 1*l.* 14*s.* and 2*l.* to 3*l.* a cwt. For an account of East Indian madder, see MUNJEET.

MADEIRA. See WINE.

MADRAS, the principal emporium of the coast of Coromandel, or western shore of the Bay of Bengal, lat. of lighthouse 13° 5′ 10″ N., long. 80° 20′ E. It is the seat of the government of the second presidency of British India, having under it a territory, including the tributary states, of 184,615 square miles, with a population, according to the latest returns, of 27,817,950, paying a gross annual revenue of 5,767,000*l.* sterling. The town is situated in the Carnatic province, a low, sandy, and rather sterile country. It is without port or harbour, lying close upon the margin of an open roadstead, the shores of which are constantly beat by a heavy surf. Besides these disadvantages, a rapid current runs along the coast; and it is within the sphere of the hurricanes or typhoons, by which it is occasionally visited. In every respect, indeed, it is a very inconvenient place for trade, and its commerce is consequently greatly inferior to that of either Calcutta or Bombay. It has been in the possession of the English above two centuries, having been founded by them in 1639, and retained ever since. Fort St. George is a strong and handsome fortification, lying close to the shore. The Black Town of Madras, as it is called, stands to the north and eastward of the fort, from which it is separated by a spacious esplanade. Here reside the native, Armenian, and Portuguese merchants, with many Europeans unconnected with the government. Like most other Indian towns, it is irregular and confused, being a mixture of brick and bamboo houses. Madras, like Calcutta and Bombay, is subject to English law; having a Supreme Court of Judicature, the judges of which are named by the Crown, and are altogether independent of the local government. The population is not exactly ascertained, but there are said to be about 400,000 persons within a radius of 2½ miles round Fort St. George.

In Madras roads, large ships moor in from 7 to 9 fathoms, with the flagstaff off the fort bearing W.N.W., 2 miles from shore. From October to January is generally considered the most unsafe season of the year, in consequence of the prevalence, during that interval, of storms and typhoons. On the 15th of October the flagstaff is struck, and not erected again until the 15th of December; during which period a ship coming into the roads, or, indeed, anywhere within soundings on the coast of Coromandel (reckoned from Point Palmyras to Ceylon), vitiates her insurance, according to the conditions of the policies of all insurance offices in India. The cargo boats used for crossing the surf, called *Massula* boats, are large and light; made of very thin planks sewed together with straw in the seams instead of caulking, which it is supposed might

render them too stiff. When within the influence of the surf, the coxswain stands up, and beats time in great agitation with his voice and feet, while the rowers work their oars backward, until overtaken by a strong surf curling up, which sweeps the boat along with frightful violence. Every oar is then plied forward with the utmost vigour to prevent the wave from taking the boat back as it recedes; until at length, by a few successive surfs, the boat is thrown high and dry upon the beach. The boats belonging to ships in the roads sometimes proceed to the back of the surf, and wait for the country boats from the beach to come to them. When it is dangerous to have communication with the shore, a flag is displayed at the beach house, which stands near the landing place, as a caution.

The fishermen and lower classes employed on the water use a species of floating machine of a very simple construction, named a catamaran. It is formed of 2 or 3 logs of light wood, 8 or 10 feet in length, lashed together, with a small piece of wood inserted between them to serve as a stem-piece. When ready for the water, they hold generally 2 men, who with their paddles impel themselves through the surf, to carry letters, or refreshments in small quantities, to ships, when no boat can venture out. They wear a pointed cap made of matting, where they secure the letters, which take no damage. The men are often washed off the catamaran, which they regain by swimming, unless interrupted by a shark. Medals are given to such catamaran men as distinguish themselves by saving persons in danger.

Light-house.—Previously to the 1st of January, 1844, a tower in the fort, 90 feet in height, was used as a light-house; but since the above epoch, this light has been discontinued, and a powerful "flashing light" has been exhibited on the new light-house immediately to the N. of the fort. This light is elevated 128 feet above the level of the sea, and may be seen in clear weather from the deck of a ship at a distance of 20 miles. The new light-house bears S. 23° W., and is distant about 13 miles from the S. Eastern extremity of the Pulicat shoal; but no ship or vessel when standing in from the northward for Madras roads should bring the light to bear to the S. of 28° W., or S. S. W. ½ W., unless her position be well ascertained. Commanders of ships should bear in mind the serious risk they run by incautiously approaching the Pulicat shoal; and as heavy weather or other causes may obscure the light, it is imperatively necessary to keep the lead going, and to keep a vigilant look out.—(*Statement issued by Marine Board.*)

Monies, Weights, and Measures.—The Company's rupee (for an account of which, see art. CALCUTTA) is now in general circulation, and is the standard uniformly referred to in all accounts. But exclusive of the Company's rupee several coins are in circulation in Madras and its vicinity. Of the gold coins, the principal are the star or current pagodas=7*s.* 5½*d.*; commonly, however, valued at 8*s.* The gold rupee, new coinage, is worth, according to the mint price of gold in England, 11. 9*s.* 2·12*d.* The Arcot rupee (silver) is very nearly of the same value with the Company's rupee. The European merchants keep their accounts at 12 fanams the rupee; 80 cash=1 fanam, and 42 fanams=1 pagoda. Copper pieces of 20 cash, called pice, and of 70 and 35 cash, called dodees and half dodees, are also current.

Commercial Weights.—Goods are weighed by the candy of 20 maunds; the maund is divided into 8 vis, 320 pollams, or 3,200 pagodas; the vis is divided into 5 seers. The candy of Madras is 500 lbs. avoirdupois. Hence the pagoda weighs 2 oz. 3 grs.; and the other weights are in proportion. These weights have been adopted by the English; but those used in the Jaghire (the territory round Madras belonging to the Company), as also in most other parts of the Coromandel coast, are called the Malabar weights, and are as follows: The gursay (called by the English garce) contains 20 baruays or candies; the baruay, 20 manungus or maunds; the maund, 8 visa or vis, 320 pollams, or 3,200 varahuns. The varahun weighs 52⅝ English grains: therefore the visa is 3 lbs. 3 dr.; the maund, 24 lbs. 2 oz.; the baruay, 482½ lbs.; and the gursay, 9,645½ lbs. avoirdupois, or 4 tons 6 cwt. nearly.

Measures of Capacity.—The garce, corn measure, contains 80 parahs, or 400 marcals; and the marcal, 8 puddies, or 64 ollocks. The marcal should measure 750 cubic inches, and weigh 27 lbs. 2 oz. 2 dr. avoirdupois of fresh spring water: hence, 45 marcals=15 Winch. bushels; and therefore the garce=17½ English quarters nearly. When grain is sold by weight, 9,256½ lbs. are reckoned for 1 garce, being 18 candies 12·8 maunds.

General Rates of Agency and Commission, as revised by the Chamber of Commerce, and recommended for general approval and adoption,—1st June, 1845.

1. On the total sum of a debit or credit side of account at the option of the agent, excepting items on which a commission of 5 per cent. is chargeable, 1 per cent.
2. On effecting remittances, or purchasing, selling, or negotiating bills of exchange, 1 per cent.
3. On subscriptions to government loans, purchasing, selling, transferring or exchanging public securities and bank shares, ½ per cent.
4. On delivering up public securities, or lodging them in any of the public offices, ½ per cent.
5. On receiving and delivering private commissions of wines, cattle, and merchandise, 2½ per cent.
6. On collecting rents, 2½ per cent.
7. On purchase of lottery tickets, and amount of prizes, 1 per cent.
8. On the sale of lottery tickets from other settlements, 2½ per cent.
9. On letters of credit granted against pay and allowances to be drawn monthly 2½ per cent.
10. On executorship or administration to estates of deceased persons, 5 per cent.
11. On the management of estates for executors or administrators, 2½ per cent.
12. On becoming security for administrators, 2½ per cent.
13. On debts when a process of law or arbitration is necessary, 2½ per cent.
    And if recovered by such means, 5 per cent.
14. On bills of exchange, notes, &c., dishonoured, 1 per cent.
15. On overdue debts collected, 2½ per cent.
16. On becoming security for individuals to government or others, 2½ per cent.
17. On all sales or purchases of goods, 5 per cent.

With the following exceptions:—

On houses, lands, and ships, 2½ per cent.
On diamonds, pearls, and jewellery, 2½ per cent.
On treasure and bullion, 1 per cent.
On all goods and merchandise withdrawn, shipped, or delivered to order, half commission.
On all other descriptions of property for sale, if withdrawn or otherwise disposed of by the owners, half commission.
On goods transferred to auction or commission salesmen, half commission.

18. On investing proceeds of sales in goods, 2½ per cent.
19. On guaranteeing sales, bills, bonds, contracts for goods, or other engagements, 2½ per cent.
20. On ships' disbursements, 2½ per cent.
21. On chartering ships or engaging tonnage for other parties, 2½ per cent.
22. On advertising as the agents of owners or commanders of ships for freight or passengers, on the amount of freight or passage money, by charter or otherwise, whether the same shall pass through the agents' hands or not, 5 per cent.
23. On effecting insurance, or writing orders for insurance, whether on lives or property, ½ per cent.
24. On settling losses, partial or general, and returns of premium, 2 per cent.
25. On procuring money on respondentia, wherever payable, 2 per cent.
26. On giving orders for the provision of goods where a commission is not chargeable on sale or shipment, 2½ per cent.
27. On attending the delivery of contract goods, 2 per cent.
28. On receiving freight of goods, and passage money of troops by ships entered inwards, 2½ per cent.

Rates of Godown Rent per Month.

	Rs.	a.
Bales of punjum cloth of 30 pieces, per bale	0	8
Screwed do. of cotton, of 500 lbs., per bale	0	4
Loose bundles of do. of 200 lbs., per bundle	0	4
Bales of taffaties and raw silk, per bale	1	0
Chests of opium, per chest	0	8
of indigo, per chest	0	8
of wine, of 12 dozen, per chest	0	8
Pipes of wine, puncheons and butts, each per pipe	1	0
Bags of rice and sugar, per bag	0	1
of saltpetre, per bag	0	1
Metals, per ton	0	4

Other articles in proportion to the above.

GOVERNMENT BANK.—*Rates of Interest on Loans.*

Rates of interest on loans for a specified period (not exceeding 12 months) on mortgage of government paper, 5 per cent.
On cash accounts made up quarterly on the deposit of government paper, on all payments, 6 per cent.
On all receipts, 5 per cent.
Lowest sum allowed on loan on cash accounts, 3,500 rupees.

Rates of Discount.

On private bills, 5 per cent.
On government bills, 4 per cent.
(No bills discounted that have a longer period to run than 3 months.)
To open an account, the sum required to be transmitted is 500 rupees.
The lowest sum received, after opening an account, is 100.
Do. paid on a cheque, is 35.
N. B.—No cheque paid, nor monies carried to account after half past 2 P. M.

This bank is entirely a government concern, the directors consisting of the superior officers of government; and the ministerial officers are on fixed salaries. The bank issues notes, receivable as cash at the public treasuries, within the town of Madras; it receives deposits and grants discounts. In 1843, however, a joint stock company, called the Bank of Madras, with a capital of 300,000*l.* (30 lacs) was established for the transacting of banking business on more liberal terms.

The foregoing statements sufficiently exhibit the commercial importance of Madras. The limited extent of its trade, as compared with that of Calcutta and Bombay, is partly ascribable to the badness of its port or roadstead, the want of any navigable river or other easy means of communication with the interior, and the backward state of the provinces of which it is the capital, in consequence of the heavy and fluctuating land tax to which they are subject. (*Hamilton's East Indian Gazetteer; Geog. Dict.* art. *Madras; Madras Almanack; Official Returns of the Trade of Madras, &c.*, obligingly communicated to us by Mr. Hornidge of the East India House.

MAGNESIA. (Fr. *Magnésie;* Ger. *Gebraunte Magnesia;* It. *Magnesia*), one of the primitive earths, having a metallic basis. It is not found native in a state of purity, but is easily prepared. It is inodorous and insipid, in the form of a very light, white, soft powder, having a specific gravity of 2·3. It turns to green the more delicate vegetable blues, is infusible, and requires for its solution 2,000 parts of water at 60°.

MAHOGANY, the wood of a tree (*Swietenia Mahogani*) growing in the West Indies and Central America. There are two other species of Swietenia found in the East Indies, but they are not much known in this country.

Mahogany is one of the most majestic and beautiful of trees; its trunk is often 40 feet in length, and 6 feet in diameter; and it divides into so many massy arms, and throws the shade of its shining green leaves over so vast an extent of surface, that few more magnificent objects are to be met with in the

vegetable world. It is abundant in Cuba and Hayti, and it used to be plentiful in Jamaica; but in the latter island, most of the larger trees, at least in accessible situations, have been cut down. The principal importations into Great Britain are made from Honduras and Campeachy. That which is imported from the islands is called Spanish mahogany; it is not so large as that from Honduras, being generally in logs from 20 to 26 inches square and 10 feet long, while the latter is usually from 2 to 4 feet square and 12 or 14 feet long, but some logs are much larger. Mahogany is a very beautiful and valuable species of wood: its colour is a red brown, of different shades, and various degrees of brightness; sometimes yellowish brown; often very much veined and mottled, with darker shades of the same colour. The texture is uniform, and the annual rings not very distinct. It has no larger septa; but the smaller septa are often very visible, with pores between them, which in the Honduras wood are generally empty, but in the Spanish wood are mostly filled with a whitish substance. It has neither taste nor smell, shrinks very little, and warps or twists less than any other species of timber. It is very durable when kept dry, but does not last long when exposed to the weather. It is not attacked by worms. Like the pine tribe, the timber is best on dry rocky soils, or in exposed situations. That which is most accessible at Honduras grows upon moist low land, and is, generally speaking, decidedly inferior to that brought from Cuba and Hayti; being soft, coarse, and spongy; while the other is close grained and hard, of a darker colour, and sometimes strongly figured. Honduras mahogany has, however, the advantage of holding glue admirably well; and is, for this reason, frequently used as a ground on which to lay veneers of the finer sorts. The best qualities of mahogany bring a very high price.

Not long since, Messrs. Broadwood, the distinguished pianoforte manufacturers, gave the immense sum of 3,000*l.* for three logs of mahogany! These logs, the produce of a *single tree*, were each about 15 feet long, and 38 inches square; they were cut into veneers of 8 to an inch. The wood was particularly beautiful, capable of receiving the highest polish; and when polished, reflecting the light in the most varied manner, like the surface of a crystal; and from the wavy form of the pores, offering a different figure in whatever direction it was viewed. Dealers in mahogany generally introduce an auger before buying a log; but, notwithstanding, they are seldom able to decide with much precision as to the quality of the wood, so that there is a good deal of lottery in the trade. The logs for which Messrs. Broadwood gave so high a price were brought to this country with a full knowledge of their superior worth. Mahogany was used in repairing some of Sir Walter Raleigh's ships at Trinidad, in 1597; but it was not introduced into use in England till 1724.

The duty on foreign mahogany used to be 7*l.* 10*s.* a ton, on Honduras, 1*l.* 10*s.*, and on Jamaica mahogany, 4*l.*; its effect being to force the consumption of the inferior in preference to the superior article. Luckily, however, the duty on foreign and colonial mahogany, after being reduced in 1845 to 20*s.* and 5*s.* a ton, was wholly repealed in 1845. There has been, in consequence, a very great increase in the consumption of the superior sorts of mahogany for upholstery purposes, while the cheaper varieties are now largely employed, notwithstanding the difficulties thrown in the way by Lloyd's regulations, in the construction of ships, and in coarser fabrics. In 1840 the imports amounted to 23,115, and in 1857 to 41,038 tons, the re-exports during the latter year being only 2,460 tons. Honduras, Cuba, and Hayti, are the great sources of supply; the timber brought from the first being the cheapest and by far the most abundant.—(See *Tredgold's Principles of Carpentry*, p. 204.; *Library of Entertaining Knowledge*, volume on *Timber Trees and Fruits*; *Edwards's West Indies*, vol. iv. p. 208. ed. 1819, &c.; and the *Mahogany Tree, by Messrs. Chaloner and Fleming, passim.*)

MAIZE, or INDIAN CORN (Fr. *Bled de Turquie*; Ger. *Türkisch korn*, *Mays*; It. *Grano Turco o Siciliano*; Sp. *Trigo de Indias*, *Trigo de Turquia*), one of the cereal grasses (*Zea Mays*), supposed to be indigenous to South America, being the only species of corn cultivated in the New World previously to its discovery. It was introduced into the Continent about the beginning, and into England a little after the middle, of the 16th century. Its culture has spread with astonishing rapidity; being now extensively grown in most Asiatic countries, and in all the southern parts of Europe. It has the widest geographical range of all the cerealia, growing luxuriantly at the equator, and as far as the 50th degree of north, and the 40th of south latitude. It has been raised in England, in nursery gardens near the metropolis, for more than a century; and recently it has been attempted to raise it in the fields, but with indifferent success. Like other plants that have been long in cultivation, it has an immense number of varieties. The ear consists of about 600 grains, set close together in rows, to the number of 8, 10, or 12. The grains are usually yellow; but they are sometimes red, bluish, greenish, or olive-coloured, and sometimes striped and variegated. The maize of Virginia is tall and robust, growing 7 or 8 feet high; that of New England is shorter and lower; and the Indians further up the country have a still smaller sort in common use. The stalk is jointed like the sugar cane. The straw makes excellent fodder; and the grain, as a bread corn, is liked by some; but though it abounds in mucilage, it contains little or no gluten, and is not likely to be much used by those who can procure wheaten or even rye bread.—(*Loudon's Encyclopædia of Agriculture, &c.*) For the imports of maize, duties, &c., see Corn Laws and Corn Trade.

MALAGA, a city and sea-port in the S. of Spain, in Granada, lat. 36° 43½′ N., lon. 4° 25′ 7″ W. Population in 1857, 113,050.

Harbour.—Malaga has an excellent harbour. It is protected on its eastern side by a fine mole, full 700 yards in length. At its extremity a lighthouse has been constructed, furnished with a powerful light, revolving once every minute. At a distance it appears obscured for 45 seconds, when a brilliant flash succeeds for the other 15 seconds. A shoal has grown up round the mole head, and the depth of water throughout the harbour is said to be diminishing. Latterly, however, a dredging machine has been employed to deepen it, by clearing out the mud and accumulating sand. The depth of water, at the entrance to the harbour and within the mole, is from 26 to 30 feet; and close to the city from 8 to 10 feet. The harbour could easily accommodate more than 450 merchant ships; it may be entered with all winds, and affords perfect shelter.

Trade, &c.—Owing to the want of official returns, and the prevalence of smuggling, it is not possible to obtain any accurate accounts of the trade of Malaga, or, indeed, of any Spanish port. The great articles of export are wine and fruits, particularly raisins and almonds, grapes, figs, and lemons; there is also a considerable exportation of olive oil, with quantities of brandy, anchovies, cummin seed, aniseed, barilla, *esparto labrado* (see ESPARTO), soap, &c. The lead which is largely exported from Malaga is brought from Ada.—(See LEAD.) The imports consist principally of cotton stuffs, iron and hardware, machinery, coals, &c., from England; with salt-fish, dye stuffs, and all sorts of colonial produce; linens; raw cotton from the U. States; butter and cheese from Holland; timber and naval stores from the Baltic, &c. The Americans import considerable quantities of Malaga wine.

The following details, abstracted from Mr. Inglis's valuable work on Spain, contain accounts of the trade of Malaga, which are still of interest.

"*Wine.*—The wines of Malaga are of two sorts, sweet and dry; and of the former of these there are four kinds: first, the common 'Malaga,' known and exported under that name. In this there is a certain proportion of boiled wine, which is allowed to burn, and which communicates a slightly burnt taste to the 'Malaga.' The grape from which this wine is made is a white grape, and every pipe of 'Malaga' contains no less than *eleven* gallons of brandy. Secondly, 'Mountain.' This wine is made from the same grape as the other, and, like it, contains colouring matter and brandy; the only difference is that, for 'Mountain,' the grape is allowed to become riper. Thirdly, 'Lagrimas,' the richest and finest of the sweet wines of Malaga; the name of which almost explains the manner in which it is made. It is the droppings of the ripe grape hung up, and is obtained without the application of pressure.

"The dry wine of Malaga is produced from the same grape as the sweet wine, but pressed when greener; in this wine there is an eighth part more of brandy than in the sweet wine; no less than 1-12th part of the dry Malaga being brandy.

"The whole produce of the Malaga vineyards is estimated at from 35,000 to 40,000 pipes; of which about 27,000 pipes may be exported. The principal market is the U. States and S. America; and to these the export is upon the increase. The average price of the wines shipped from Malaga does not exceed 35 dollars per pipe; but wines are occasionally exported at the price of 170 dollars. Many attempts have been made at Malaga to produce sherry, but not with perfect success. The sherry grape has been reared at Malaga upon a soil very similar to that of Xeres; but the merchants of Malaga have not ventured to enter the wine for export. One reason of the very low price of the wines of Malaga is to be found in the cheapness of labour; field labour is only 2½ reals a day (4½*d.*). In the fruit and vintage time it is about double.

"*Fruit.*—Next to its wines, the chief export of Malaga is fruit, consisting of raisins, almonds, grapes, figs, and lemons; but of these, raisins are principally exported.

"The raisins exported from Malaga are of three kinds, *muscatel*, *bloom* or *sun raisin*, and *lexias* The muscatel is the finest raisin in the world. In its preparation no art is used; the grape is merely placed in the sun, and frequently turned. The bloom or sun raisin is a different grape from the muscatel; but its preparation is the same. The lexias acquire this name from the liquor, or ley, in which they are dipped and which is composed of water, ashes, and oil; these, after being dipped, are also dried in the sun. All muscatel raisins are exported in boxes, and also a part of the bloom raisins.

"Of the other fruits raised near Malaga, grapes, almonds, and lemons are the most extensively exported.

"*Oil.*—There is also a large export of oil from Malaga."—(Vol. ii. pp. 190—196.)

The trade of Malaga, like that of most other Spanish ports, has been materially increased of late years. Lines of steamers have been established that ply along the southern and eastern coasts of the peninsula, and a powerful stimulus has been given to all sorts of industrial pursuits. The influence of the latter is, no doubt, most powerfully felt at Alicant, Valencia, and those towns that have improved communications with the interior, but it is, also, sufficiently obvious here and in others of the less favourably situated seaports.

Money.—Accounts are kept in reals of 34 maravedis vellon.—(For the coins, and their value, used at Malaga, see CADIZ.)

Weights and Measures.—The weights are the same as those of Cadiz. The arroba, or cantara=4·19 English wine gallons; the regular pipe of Malaga wine contains 35 arrobas, but is reckoned only at 31; a bota of Pedro Ximenes wine=53⅓ arrobas; a bota of oil is 43, and a pipe 35 arrobas; the latter weighs about 860 lbs. avoirdupois: a carga of raisins is 2 baskets, or 7 arrobas; a cask contains as much, though only called 4 arrobas: as a last for freight are reckoned—4 botas or 5 pipes of wine or oil; 4 bales of orange peel; 5 pipes of Pedro Ximenes wine or oil; 10 casks of almonds (each about 380 lbs. English); 20 chests of lemons and oranges; 22 casks of almonds (of 8 arrobas each); 44 casks of raisins (of 4 arrobas each); 88 half casks of raisins; 50 baskets or 160 jars of raisins.

Port Charges.—The port and harbour dues amount, on an English vessel of 300 tons, to about 21*l.*; on a Spanish vessel, of the same burden, they would be about 11*l.* 10*s.*

Warehousing.—Goods may be warehoused for 12 months, paying 2 per cent. *ad valorem* in lieu of all charges; but, at the end of the year, they must be either entered for consumption or reshipped. The 2 per cent. is charged, whether they lie a day or the whole year.

There is an excellent account of Malaga in *Townsend's Travels in Spain*, vol. iii. pp. 10—42.

MALMSEY. See WINE.

MALT (Ger. *Maly*; Du. *Mout*; Fr. *Mal, Blédgermé*; It. *Malto*; Sp. *Cebada retonada ó entallecida*; Rus. *Solod*; Lat. *Maltum*). The term malt is applied to designate grain which, being steeped in water, is made to germinate to a certain extent, after which the process is checked by the application of heat. This evolves the saccharine principle of the grain, which is the essence of malt. The process followed in the manufacture is very simple. Few changes have been made in it; and it is carried on at this moment very much in the same manner that it was carried on by our ancestors centuries ago. Rice, and almost every species of grain, has been used in malting; but in Europe, and especially in England, malt is prepared almost wholly from barley. It

is the principal ingredient in the manufacture of beer, and is little used except in brewing and the distillation of spirits.

Duties on, and Consumption of, Malt. Influence of the Reduction of the Duty and the Opening of the Trade.—Owing to malt liquor having early become the favourite beverage of the people of England, the manufacture of malt has been carried on amongst us, for a lengthened period, on a very large scale. Instead, however, of increasing with the increasing wealth and population of the country, it was nearly stationary for the hundred years ending with 1816. In proof of this we may mention that the quantity of malt that paid duty in England and Wales, at an average of the 12 years ending with 1720, was 24,191,304 bushels a year; whereas the annual average quantity that paid duty during the 12 years ending with 1816, was only 23,197,754 bushels! This apparently anomalous result is probably in some measure to be accounted for by the increased consumption of tea and coffee, which are now in almost universal use; but there cannot be a question that it is mainly owing to the exorbitant duties with which malt, and the ale or beer manufactured from it, have been loaded, and to the oppressive regulations imposed on the manufacture of malt and the sale of beer. The effect of these duties and regulations was to impose a tax of about 7*s.* on the malt and beer made from a bushel of barley; which, taking the average price of barley at from 4*s.* to 5*s.* a bushel, was equivalent to an *ad valorem* duty of from 140 to 175 per cent.! The exorbitancy of the duty was not, however, its most objectionable feature. It was about equally divided—one half being assessed directly on malt, and the other on beer: but the beer duty affected only beer brewed by public brewers, or for sale, and did not affect that which was brewed for private use; and as rich families brewed all the beer they made use of, the consequence of this distinction was, that the beer duty fell wholly on the lower and middle classes, who did not brew any beer; or, in other words, the poor man was compelled to pay twice the duty on the malt he made use of that was paid by the rich man! That such a distinction should ever have been made, or submitted to for any considerable period, is certainly not a little astonishing. Originally, however, the distinction was not so great as it afterwards became; and being increased by slow degrees, the force of habit reconciled the parliament and the country to the gross inequality and oppressiveness of the tax. But the public attention being at length forcibly attracted to the subject, and the effect of the exorbitant duties on malt and beer in increasing the consumption of ardent spirits having been clearly pointed out —(see *Edinburgh Review*, No. 98. art. 4.), the beer duty was repealed in 1830. This measure of substantial justice and sound policy reflected great credit on the administration of the Duke of Wellington; which was also entitled to the public gratitude for having placed the licensing system on a fair footing, and established, for the first time, a free trade in beer.

The repeal of the duty has materially increased the consumption of malt; and the anticipations of those who contended that its abolition, if combined with a free trade in beer, would be no great loss to the revenue, are in a fair way of being realised. The clamour that was raised against the measure, on account of its supposed influence in increasing drunkenness, was, we firmly believe, wholly without foundation. If the measure increased, as it certainly did, the consumption of beer, the probability is that it equally diminished the consumption of gin; and it is surely superfluous to add, that this is a most beneficial change. It is true that a number of new public houses were opened for the sale of beer; but it has not hitherto been proved that this circumstance, though it occasioned no common alarm among the clergy and magistrates in different parts of the country, was productive of any public inconvenience. Like all newly opened lines of business, the trade of beer selling was overdone; and a considerable number of beer shops have since been shut up. "It is not," as Adam Smith sagaciously remarked, "the multiplication of alehouses that occasions a general disposition to drunkenness among the common people; but that disposition, arising from other causes, necessarily gives employment to a multitude of alehouses."—(*Wealth of Nations*, p. 161.) The way to eradicate this disposition is by giving a better education to the poor, and inspiring them with a taste for less grovelling enjoyments. All that the fiscal regulations and police enactments intended to promote sobriety have ever done, is to make bad worse, to irritate and disgust, to make the lower classes more enamoured of that which they conceive is unjustly withheld from them, and to stimulate them to elude and defeat the law.

The duty on malt was first imposed in England in 1697, and in Scotland in 1713; but it was not introduced into Ireland till 1785. The following tables exhibit the progress of the consumption and of the duties directly falling on malt from a remote period. But the principal consumption of malt being in beer, the duties on the latter were, in fact, duties on malt; and must always be taken into account in forming anything like a correct estimate of the influence of the latter. Ample information as to the duties on beer will be found in the art. Ale and Beer.

Prices of Malt, at Greenwich Hospital, from 1730 to 1840, per Winchester Quarter, and from 1845 to 1849, per Imperial ditto.

Regulations as to the Manufacture of Malt. — These are embodied in the acts 7 & 8 Geo. 4. c. 52, and 11 Geo. 4. c. 17. The former act is exceedingly complex; it has no fewer than *eighty-three* clauses; and the regulations embodied in it, though frequently repugnant to common sense, were enforced by 106 penalties, amounting in all to the enormous sum of 15,500*l.*! But it was not in the nature of things that such a law could be allowed to exist for any considerable period. It was not only loudly and universally condemned by the maltsters, but by all the more intelligent officers of excise. In consequence, the 11 Geo. 4. c. 17. was passed. This latter statute is entitled to very considerable praise; it repeals a good many of the penalties, and some of the most vexatious and useless regulations, in the former; so that the business may now be carried on with equal security to the revenue, and with infinitely less risk and annoyance on the part of the manufacturer. The existing regulations principally refer to the gauging of the cisterns, the wetting of the malt, the emptying of the cisterns, the gauging of the malt when in the coach frames, the payment of the duties, &c. But as no one would think of undertaking the business of a maltster without having a copy of both acts in his possession, it would be quite unnecessary for us, even if our limits permitted, to give an abstract of these acts.

Malt may not be imported into the U. Kingdom for home use under pain of forfeiture; but it may be warehoused for exportation. — (6 Geo. 4. c. 107. s. 52.)

MALTA, an island in the Mediterranean, belonging to the British, nearly opposite to the southern extremity of Sicily, from which it is about 54 miles distant.

Valetta, the capital, is situated on the north coast of the island, the lighthouse in the castle of St. Elmo being in lat. 35° 54′ 6″ N., lon. 14° 31′ 1″ E. Malta is about 20 miles long, and 10 or 12 broad. The island of Gozo, about a fourth part of the size of Malta, lies to the north-west of the latter, at about 4 miles' distance; and in the strait between them is the small island of Cumino. In 1856 the population of both islands amounted, excluding the garrison (ex the Maltese regiment), to 142,537; of which that of Gozo might be about 16,000. The entire revenue collected in Malta usually amounts to about 100,000*l.* a-year, of which about 23,000*l.* is derived from the rent of lands.

Valetta, the capital of the island, is defended by almost impregnable fortifications.

"These," says Mr. Brydone, "are indeed most stupendous works. All the boasted catacombs of Rome and Naples are a trifle to the immense excavations that have been made in this little island. The ditches, of a vast size, are all cut out of the solid rock; these extend for a great many miles; and raise our astonishment to think that so small a state has ever been able to make them."—(*Tour through Sicily and Malta*, Letter 15.) Since the island came into our possession, the fortifications have been considerably improved; so that at present it is a place of very great strength.

After the capture of Rhodes by the Turks, the Emperor Charles V. made a present of Malta to the Knights of St. John of Jerusalem, in whose possession it remained till 1798, when it was taken by the French. It was taken from the latter by the English in 1800; and was definitely ceded to us in 1814.

The island consists mostly of a rock, very thinly covered with soil, a good deal of which has been brought, at an immense expense, from Sicily; but being cultivated with the utmost care, it produces excellent fruits, particularly the celebrated Maltese oranges, corn, cotton, with small quantities of indigo, saffron, and sugar. The principal dependence of the inhabitants is on their cotton; the crop of which, amounting to about 4,000,000 lbs. a year, is partly exported raw, and partly manufactured to the value of from 80,000*l.* to 100,000*l.* The corn raised in the island is not sufficient to feed the inhabitants for more than 5 or 6 months, and at an average above 100,000 quarters of foreign wheat are required for their use. In addition to corn, cattle, provisions of all sorts, inc. dried fish, fruits, Spanish peas, &c., are largely imported. The other leading articles of import comprise cottons, cotton yarn, linens, woollens, and most sorts of manufactured goods; coal, partly for use in the island, but far more for the supply of the steamers that call here on their voyage to and from Alexandria, Marseilles, &c; gunpowder, and other warlike stores for the use of the garrison; sugar, coffee, and other colonial products; tobacco, oil, wines, timber, &c. The trade in corn used to be monopolised by government; and after the monopoly was abandoned, duties on importation, varying with the price, were imposed. But in 1835, these duties were abolished; and the fixed duties on corn entered for consumption, specified in the subjoined tariff, were substituted in their stead.

Malta presents unusual facilities, which have not hitherto been taken proper advantage of, for becoming the entrepôt of the corn trade of the Mediterranean and Black Sea. Her warehouses for corn are, like those of Sicily and Barbary, excavated in the rock; and are, perhaps, the best fitted of any in Europe for the safe keeping of corn. The wheat lodged in them may be preserved for an indefinite period; and it is affirmed that though it should, on being deposited, be affected by the weevil, it is very soon freed from that destructive insect. It is not often that corn can be brought direct from Odessa, Taganrog, &c. to England, without the risk of being damaged; but were it brought in the first instance to Malta, and bonded there, it might afterwards be conveyed in the best order to London, or anywhere else. Malta is also admirably well suited for becoming a centre of the corn trade of Egypt, Barbary, Italy, &c.

During the late war, particularly during the period when Napoleon's anti-commercial system was in operation, Malta became a great entrepôt for colonial and other goods, which were thence conveyed, according as opportunities offered, to the adjacent ports. This commerce ceased with the circumstances that gave it birth; and for some years after the return of peace, the trade of the island was depressed below its natural level by the imposition of various oppressive discriminating duties. In 1819, this vexatious system was partially obviated; but it continued to exert a pernicious influence till 1837, when, pursuant to the recommendation of Messrs. Austin and Lewis, commissioners of inquiry, the then existing tariffs of customs duties and port charges were wholly abolished; and a new tariff (which is subjoined) was issued in their stead. It imposed moderate duties, for the sake of revenue only, on a few articles in general demand, without regard to the country whence they came, at the same time that it equalised the tonnage duties, and reduced the warehouse rent on articles in bond to the lowest level.

There are some good springs of fresh water. Valetta is partly supplied by water brought by an aqueduct a distance of about 6 miles, and partly by the rain collected in cisterns.

Harbour.— The harbour of Valetta is double, and is one of the finest in the world. The city is built on a narrow tongue of land, having the castle and light of St. Elmo at its extremity and an admirable port on each side. That on the south-eastern side, denominated the grand port, is the most frequented. The entrance to it, about 250 fathoms wide, has the formidable batteries of St. Elmo on the one hand, and those of Fort Ricasoli on the other. In entering, it is necessary not to come within 50 or 60 fathoms of the former, on account of a spit which projects from it; but in the rest of the channel there is from 10 to 12 fathoms water. The port, which runs about 1¾ mile inwards, has deep water and excellent anchorage throughout: the largest men-of-war coming close to the quays. Port Marsamusceit, on the north western side of the city, is also a noble harbour. The entrance to it, which is about the same breadth as that of the grand port, is between St. Elmo and Fort Tiqua. In the centre of the basin is an island, on which are built a castle and a lazaretto, for the convenience of the ships performing quarantine, by which the port is principally used. Owing to the narrowness of the entrance, and the usual variableness of the wind, it is customary for most vessels bound for Valetta to take a pilot on board before entering the harbour.

TARIFF (A). — Duties on Imports, and Dues for Store Rent, which the Collector of Customs is required to levy on the Account of the Government of Malta.

Articles.	Import Duties.		Store Rents on Articles lodged in Bond.	
	£	s. d.	£	s. d.
Beer, per Maltese barrel	0	2 0	0	1
Cattle: bullocks and other animals of the kind, per head	0	10 0		
Horses and mules, per head	1	0 0		
Charcoal, per salm	0	0 6	0	1
Grain: —				
Wheat, per salm	0	10 0	0	2
Indian corn, per salm	0	6 0	0	2
Barley, per salm	0	4 0	0	2
Saggina, per salm	0	3 0	0	2
Other inferior grains	0	5 0	0	2
Manufactured grain, per cantar	0	6 0	0	2
Wheat, Indian corn, barley, or other inferior grains, if damaged so as to be unfit for the food of man (commonly called *frumentazzo*), per salm	0	2 0	0	2
Manufactured grain, if damaged so as to be unfit for the food of man, per cantar	0	2 0	0	2
Oil, olive, per caffiso	0	0 6	0	0½
Potatoes, per cantar	0	0 10	0	2
Pulse and seeds: —				
Beans, caravances, chick-peas, kidney-beans, lentils, lupins, peas and vetches, per salm	0	2 0	0	2
Carob-beans and cotton seeds, per cantar	0	0 6	0	2
Spirits; viz. for every Maltese barrel of such spirits of any strength not exceeding the strength of proof by Sykes's hydrometer, namely London proof, and so in proportion for any greater strength than the strength of proof	1	2 0	0	2
Vinegar, per Maltese barrel	0	2 0	0	2
Wines, the value of which shall exceed 15*l.* per pipe of 11 Maltese barrels, per Maltese barrel	0	11 0	0	2
All other wines, per Maltese barrel	0	2 0	0	2

Observations. — 1. The duties payable by the salm on grain, pulse, and seed (except large Sicilian beans) to be charged by the strike measure. The duties on large Sicilian beans and on charcoal to be charged by the heaped measure.

2. Every liquid compounded of spirit and any other ingredient or ingredients, and containing more than 25 per cent. of spirit of the strength of proof, to be liable to the duty on spirit which is imposed by the present tariff.

3. The store rents on grain lodged in bond to be payable from the day on which the grain was lodged. The store rents on every other article mentioned in the present tariff to be payable from the tenth day after the day on which such article was lodged.

TARIFF (B). — Tonnage Dues which the Collector of Customs is required to levy on the Account of the Government of Malta.

Vessels discharging merchandise in the island shall, on clearing outwards, pay for every ton or any part thereof - 6*d.*

TARIFF (C). — Fees which the Collector of Customs is required to levy on the Account of the Government of Malta.

	£	s. d.
For each certificate under the office seal	0	2 6
For each sheet of printed official forms	0	0 2

Tariff of Dues authorised to be levied for Account of Government, by the superintendent of Quarantine, Malta.

Shipping in Quarantine. — 1. Vessels entered upon a quarantine to pay for each day of their continuance in port, as follows: —

	s. d.
Vessels not exceeding 25 tons	0 6
— from 26 tons to 50 —	1 0
— from 51 — 100 —	1 6
— from 101 — 150 —	2 0
— from 151 — 200 —	2 6
— from 201 — 250 —	2 9
— from 251 — and upwards	3 0

2. Vessels of whatever size, sailing in quarantine, having entered upon the performance thereof, to pay at the above rates, but in no case more than 2*s.* a day for the remainder of the term of quarantine.

3. Vessels liable to quarantine, not having entered upon the performance thereof, to pay 2*s.* for each day in their continuance in port.

4. Vessels compelled by stress of weather to enter the great harbour, to be subject, while they remain there, to the additional charge of 3*s.* a day, for every guard boat which the Superintendent of Quarantine may deem it necessary to place over them.

*** Any vessel in quarantine entering the great harbour without a justifiable cause, incurs the penalty of 200 dollars imposed by the second article of the proclamation, dated 12th October, 1820. (No. xiii.)

5. Vessels having contagious diseases on board to pay an extra rate in proportion to the expense that may be incurred, but in no case to exceed 20*s.* a day, in addition to the usual rate.

Effects received into the lazaret for deputation to be chargeable with a due proportion of the actual expense thereof, which at present, on ordinary occasions, is at the rate of 2*s.* 6*d.* a day for each guardian, and 1*s.* 8*d.* a day for each labourer, whom it may be necessary to employ.

Cattle landed in the lazaret to be chargeable, for each	s. d.
Horse, mule, or ass	3 0
Bullock, or other animal of the kind	2 0
Sheep, goat, pig, or other small animal	1 0

Persons performing quarantine in the lazaret to pay at the rate of 2*s.* 6*d.* a day, for each guardian employed, but no single individual to be chargeable with more than 1*s.* 8*d.* a day.

Documents issued under the office seal, 2*s.* 6*d.* each.

Rates of Pilotage to be exacted from vessels entering or departing from the harbours of Valetta or Marsamuscetto when in charge of pilots, viz: —

For vessels up to the register tonnage of	£	s. d.
101 tons	0	8 4
From 101 — to 150	0	12 6
— 151 — to 250	0	16 8
— 251 — to 350	1	1 0
— 351 — and upwards	1	5 0

For leaving either of the above mentioned harbours when proceeding to sea, half of the above rate to be paid.

Going out of one of the above mentioned harbours and entering the other, two-thirds of the above rate to be paid.

Pilots keen on board of vessels in quarantine are entitled (if victualled on board) to 1*s.* 8*d.* per diem, if otherwise to 2*s.* 4*d.* exclusive of the pilotage.

N. B. — In all cases pilot boats must be in readiness when required.

An Account of the Quantities and Declared Values of the Principal Articles of British and Irish Produce and Manufacture exported from the U. Kingdom to Malta in each of the 3 Years ending with 1856.

We also exported to Malta in 1856 foreign colonial produce to the amount of 75,176*l.* The value of the imports from Malta during the same year was 215,202*l.*; but they consisted in great part of foreign articles *en entrepôt*.

The central position, excellent port, and great strength of Malta, make it an admirable naval station for the repair and accommodation of the men-of-war and merchant-ships frequenting the Mediterranean, and render its possession of material importance to the British empire. Since Malta-built vessels were admitted into the ports of the U. Kingdom on the same terms as those of British-built, the trade of shipbuilding has materially increased in the island. The Maltese shipwrights are diligent expert workmen; and, their wages being moderate, it is a favourable place for careening. Owing to the want of a

dry dock. all ships above the size of a sloop of war, that require to have their bottoms examined, have to come to England for that purpose. This, surely, should be obviated. Quarantine is strictly enforced at Malta; but there is every facility for its performance, and the charges are less than at any other port in the Mediterranean.

Malta is now the centre of a very extensive steam-packet system; the steamers from England for the Ionian Islands, Constantinople, Alexandria, and other ports of the Levant, touching here. The French steamers from these ports usually perform quarantine at Malta.

Money.—In 1825, British silver money was introduced into Malta; the Spanish dollar being made legal tender at the rate of 4*s.* 4*d.*; the Sicilian dollar at 4*s.* 2*d.*; and the scudo of Malta at 1*s.* 8*d.*

Weights and Measures. — The pound or rottolo, commercial weight = 30 oncie = 12·216 English grains. Hence 100 rottoli (the cantaro) = 174½ lbs. avoirdupois, or 79·14 kilog. Merchants usually reckon the cantaro at 175 lbs.

The salma of corn, stricken measure = 8·221 Winchester bushels: heaped measure is reckoned 16 per cent. more. The caffiso, or measure for oil, contains 5½ English gallons=20·818 litres. The barrel is double the caffiso. The Maltese foot = 11 1-6th English inches = ·2836 metres. The canna = 8 palmi = 81·9 English inches = 2·079 metres. Merchants usually convert Malta measure into English in the proportion of 3½ palmi to a yard, or 2 2-7th yards to 1 canna.

Bills on London are usually drawn at 30 and 60 days' sight. The deputy commissary general is obliged to grant, at all times, bills on the treasury here for British silver tendered to him, at the rate of 100*l.* bill for every 101*l.* 10*s.* silver, receiving, at the same time, other silver, at a fluctuating rate of exchange.

MAN (ISLE OF) is, as every one knows, situated in the Irish Sea, at about an equal distance from England, Scotland, and Ireland. It is about 30 miles long, and 10 or 12 broad. The interior is mountainous, and the soil nowhere very productive. Population, in 1851, 52,387. This island used to be one of the principal stations of the herring fishery; but for a considerable period it has been comparatively deserted by the herring shoals, a circumstance which is not to be regretted; for the fishery, by withdrawing the attention of the inhabitants from agriculture and manufactures, and leading them to engage in what has usually been a gambling and unproductive business, has been, on the whole, injurious to the island. The steam packets from Glasgow to Liverpool, and from the latter to Belfast, touch at the Isle of Man; which is, in consequence, largely frequented by visiters from these cities, and other parts of the empire, whose influx has materially contributed to the improvement of Douglas, the principal port in the island, and other towns.

The feudal sovereignty of Man was formerly vested in the Earls of Derby, and more recently in the Dukes of Athol, a circumstance which accounts for the fact of the duties on most commodities consumed in the island having been, for a lengthened period, much lower than those on the same commodities when consumed in Great Britain. This distinction, which still subsists, has produced a great deal of smuggling, and been in no ordinary degree injurious to the revenue and trade of the empire. During the present century, indeed, the clandestine trade of Man has been confined within comparatively narrow limits; but to accomplish this, a considerable extra force of Custom-house officers and revenue cruisers is required; and the intercourse with the island has to be subjected to various restraints. Nothing, as it appears to us, can be more impolitic than the continuance of such a system. The public has, at a very heavy expense, purchased all the feudal rights of the Athol family; and having done so, it is certainly high time that an end were put to the anomalous absurdity of having a considerable island, lying, as it were, in the very centre of the empire, and in the direct line between some of the principal trading towns, with different duties on many important articles! It might be necessary, perhaps, to make some compensation to the inhabitants for such a change, and this might be done, with advantage to them and without expense to the public, by modifying and improving the internal regulations and policy of the island, which are very much in need of amendment. We do not, indeed, imagine that the island would lose any thing by the proposed alteration; for the temptation which the present system holds out to engage in smuggling enterprises diverts the population from the regular pursuits of industry, and, along with the herring lottery, is the principal cause of that idleness for which the Manx are so notorious. The customs revenue collected in the Isle of Man in 1852 amounted to 28,077*l.*; but from this sum 14,373*l.* was deducted on account of expenses of collection, public works, internal government, &c. We subjoin an abstract of the acts which now (1853) regulate the trade with the Isle of Man: the conditions under which it is carried on have been a good deal simplified.

The regulations under which the trade of the Isle of Man is now conducted are embodied in the Acts 16 & 17 Vict. c.106. and the 16 & 17 Vict. c. 107. and are as follows, viz. —

Duties in Table to be levied on Goods imported into Isle of Man. — In lieu of all duties of customs now payable by law upon the importation of goods into the Isle of Man, there shall be raised, levied, collected, and paid unto Her Majesty, her heirs and successors, the several duties of Customs as the same are respectively set forth in figures in following table: viz. —

DUTIES APPLICABLE TO THE ISLE OF MAN.

	£	s.	d.
1. Coffee, the import duties in Great Britain or Ireland not having been paid thereon, the lb.	0	0	2
2. Corn, viz., wheat, barley, bear or bigg, oats, rye, peas, beans, buckwheat, maize, or Indian corn - - - - the quarter	0	1	0
Wheat meal and flour, barley meal, oat meal, rye meal, and flour pea meal, bean meal, buckwheat meal, and maize or Indian corn meal - - - - the cwt.	0	0	4½
3. Hemp - - - - - -			Free.
4. Hops, from Great Britain or Ireland - -			Free.
5. Iron - - - - - -			Free.
6. Spirits, viz.:—			
Brandy, Geneva, and all foreign spirits, not being liqueurs, cordials, or perfumed spirits the gallon	0	6	0
Rum and rum shrub, of the British possessions - - - - the gallon	0	3	4

	£	s.	d.
British or Irish spirits exported from a duty-free warehouse under bond in the United Kingdom - - - the gallon	0	3	0
Such spirits not exceeding the strength of proof by Sykes's hydrometer, and so in proportion for any greater or less strength than the strength of proof, and for any greater or less quantity than a gallon.			
I. Eau de Cologne, per flask (50 not containing more than 1 gallon) - - - -	0	0	4
or the gallon	0	10	0
8. Liqueurs, cordials, and perfumed spirits —	0	10	0
9. Sugar, viz.:—			
Muscovado - - - the cwt.	0	1	0
Sugar candy, white or brown, refined sugar, or sugar rendered by any process equal to refined, foreign or British - the cwt.	0	8	0
From and after the 5th July, 1854 —	0	3	0
10. Tea - - - - - the lb.	0	1	0
From and after the 5th July, 1854 —	0	0	6
11. Tobacco, viz.:—			
Unmanufactured - - - —	0	1	6
Manufactured - - - - —	0	4	9
Cigars - - - - - —	0	4	9

	£.	s.	d.
12. Wine - - the tun of 252 gallons	12	0	0
13. Wood, all sorts - - - - - -	Free.		
14. Goods, wares, and merchandise brought from Great Britain or Ireland, and entitled to any bounty or drawback of excise on exportation from thence, and not hereinbefore enumerated or charged with duty - - - -	Free.		
15. Goods, wares, and merchandise, the growth, produce, or manufacture of and brought from Great Britain or Ireland, and not hereinbefore charged with duty - - -	Free.		
16. Goods, wares, and merchandise, not the growth, produce, or manufacture of Great Britain or Ireland, but brought from thence, and having there been entered for consumption, and the import duties having been there paid thereon	Free.		
17. Goods, wares, and merchandise imported or brought from any place from whence such goods may be lawfully imported into the Isle of Man, and not herein before charged with duty, or declared to be free of duty, for every 100*l.* of the value thereof - - -	15	0	0

Power to the Treasury to remit and reimpose the Duties on unenumerated Articles.— The commissioners of the Treasury may from time to time, by any order or orders under their hands, declare that all or any articles legally importable into the Isle of Man, and not enumerated in the said table, and upon which the said duty of 15 per cent. is hereby imposed, shall and may, from and after any day or days named in such order or orders, be imported from the places and in the manner therein mentioned into the Isle of Man duty free during such time or times as shall be therein named, or until such order or orders respectively, or any of them, shall be rescinded, and such articles shall be imported duty free accordingly so long as any such order or orders, or any of them, shall continue unrescinded; and the said commissioners may at any time, by any order under their hands, revoke the whole or any part of any previous order or orders, or any of them, for such time and in such manner as they may see fit; and all orders of the commissioners of the Treasury made in pursuance of this enactment shall be duly published in the London and Dublin gazettes twice at least within 14 days from the date of such orders respectively, and a copy of every such order shall be laid before both Houses of Parliament within 6 weeks after the date of such order if Parliament be then sitting, and if not, then within 6 weeks after the commencement of the then next session of Parliament.—16 & 17 Vict. c. 106. s. 5.

The following Treasury order has since appeared.

By virtue of the powers vested in us under the 5th section of the Customs Tariff Act, 16 & 17 Vict. cap. 106, to remit and re-impose the duties levied on unenumerated articles legally importable into the Isle of Man, these are to authorise you under the said section of the Customs Tariff Act, to allow all articles enumerated in the tariff of the U. K., and not enumerated in the tariff of the Isle of Man, and which, under the tariff of the island, would be subject to an *ad valorem* duty of 15 per cent., to be admitted free of duty so long as the order permitting such free importation shall remain unrescinded. For which this shall be your warrant.

Whitehall, Treasury Chambers, August 27. 1853. ABERDEEN, JOHN SADLEIR.

Isle of Man to be deemed Part of U. K. for the Purposes of this Act.— The Isle of Man shall be deemed and taken to be part of the U. K. for all the purposes of this act, but nothing herein contained shall prejudice or affect, or be construed in any way directly or indirectly to prejudice or affect, any of the rights or privileges legally exercised or enjoyed by the said isle at the time of the passing of this act. —16 & 17 Vict. c. 107. § 346.

Goods delivered out of Charge of Customs in Isle of Man not to be brought into Britain or Ireland.— No foreign goods upon which a higher duty is payable on their importation into Great Britain or Ireland than on their importation into the Isle of Man shall, after the same have been cleared and delivered out of charge of the proper officer of customs for consumption or otherwise in the said isle, be carried or shipped or be waterborne or be brought to any quay, wharf, or other place to be shipped or waterborne to be carried from the said isle into Great Britain or Ireland; nor shall any such goods which may be brought to the said isle, though not cleared and delivered as aforesaid, be removed or carried from thence into Great Britain or Ireland until the same have been duly cleared for that purpose by the proper officer of customs, nor (unless reported for removal in the same ship and in continuation of the voyage to some port in Great Britain or Ireland), until sufficient security by bond or otherwise shall have been given, in such manner, and on such terms and conditions as the Commissioners of Customs may direct, for the due delivery thereof at some port or place in Great Britain or Ireland; and all goods carried, brought, shipped, removed, or waterborne to be shipped, removed, or carried contrary hereto shall be forfeited, and every person who shall carry, ship, bring, remove, or waterbear to be shipped, removed, or carried any goods contrary hereto, or who shall aid or be concerned therein, shall forfeit treble the value of such goods, or the sum of 100*l.*, at the election of the Commissioners of Customs.—§ 347.

Goods, the Growth or Manufacture of the Isle of Man, may be imported into Britain or Ireland on Certificate, &c.— Any goods, the growth of the Isle of Man, or there manufactured from materials the growth of the said isle, or from materials not subject to duties in Great Britain or Ireland, or from materials upon which the duty has been paid in Great Britain or Ireland and upon which no drawback has been subsequently granted, may be brought from the said isle into Great Britain or Ireland without payment of any duty: provided always, that such goods may nevertheless be charged with such proportion of such duties as shall fairly countervail any duties of excise payable on the like sort of goods the produce of that part of the U. K. into which they shall be brought, and any articles, either wholly or in part manufactured in the said isle from any materials upon which a higher duty is payable upon their importation into the U. K. than on their importation into the Isle of Man, may be brought from the said isle into Great Britain or Ireland on payment of the duty payable on such goods in that part of the U. K. into which they shall be so brought.—§ 348.

Declaration and Certificate of Growth or Manufacture of Goods from Isle of Man.— Before any goods shall be shipped in the Isle of Man to be carried to Great Britain or Ireland, as the growth or produce of that isle, or as manufactures of that isle from materials the growth and produce thereof, or from materials not subject to duty in Great Britain or Ireland, or from materials upon which the duties shall have been paid and not drawn back in Great Britain or Ireland, proof shall be made by the written declaration of some competent person, to the satisfaction of the collector or comptroller of customs at the port of shipment, that such goods (describing and identifying them) are of such growth, produce, or manufacture, as the case may be, and in such declaration shall be stated the name of the person by whom

such goods are intended to be shipped, and such person, at the time of shipping, (not being more than 1 month after the date of such declaration), shall make and subscribe a declaration before such collector or comptroller, that the goods to be shipped are the same as are mentioned in such declaration, and thereupon the collector or comptroller shall, on demand, give to the master of the ship in which the goods are to be exported, a certificate of such proof of produce or of manufacture, describing the same, and setting forth the name of the party and of the ship and of the master thereof, and the destination of the goods.—§ 349.

Act not to affect Excise Drawbacks.—Nothing herein contained shall be deemed or construed to affect the laws and regulations now in force respecting duties and drawbacks of excise on goods removed to the Isle of Man.—§ 350.

Stores of Manx Ships.—If any ship or boat bound from the Isle of Man to Great Britain or Ireland shall have on board any stores of spirits, tobacco, or tea for the use of the crew exceeding the quantities specified in the following table, such stores, together with the casks or packages containing the same, and also the ship or boat, shall be forfeited:

	In Ships or decked Vessels.	In open Boats.
Spirits for each seaman	Half a gallon	One quart.
Tobacco for each seaman	One pound	Half a pound.
Tea for the whole crew	Two pounds	One pound.

Treasury may restrict Imports.—The Commissioners of the Treasury shall and may at any time, if they see fit, by order under their hands, restrict or limit the importation into the Isle of Man of any foreign goods to such quantities per annum and in such manner as they may deem necessary, and also determine into what ports in the Isle of Man and from what places such goods may be imported.—§ 352.

Management of Duties.—The duties of customs payable on the importation of goods into the Isle of Man shall be collected, paid, recovered, and accounted for under the management and control of the Commissioners of Customs; and, except the necessary charges of collecting, recovering, and accounting for the same, the said duties shall from time to time (subject to the deductions herein-after mentioned) be brought and paid into the receipt of H. Majesty's Exchequer, distinctly and apart from all other branches of the public revenue, and shall go to and make part of the Consolidated Fund of the U. K.: Provided always, that any of the collectors of customs of the said isle shall retain, and he and they is and are hereby authorized and required, agreeably to such directions as shall from time to time be given for that purpose by the Commissioners of Customs, to retain, such sum or sums of money in his or their hands as may be sufficient to defray the necessary expenses attending the government of the said Isle of Man and the administration of justice there, and other charges incurred in the said isle, which have heretofore been or may hereafter be deemed fit and proper charges to be deducted from and paid out of the duties of customs collected in the said Isle of Man; and upon the amount of the said expenses and charges being ascertained, the said commissioners are hereby authorized to direct the same to be paid out of the said monies so retained to such person or persons as may be entitled to receive the same.—§ 353.

Expenses of the Government, and 2,300l. per Annum to Harbour Commissioners of Isle of Man, to be paid by Customs.—The necessary expenses attending the government of the Isle of Man and the administration of justice there, and other charges incurred in the said isle, which have heretofore been deemed fit and proper charges to be deducted from and paid out of the duties of customs collected in the said isle, or which may hereafter be deemed proper charges, and also the annual sum of 2,300*l.* made payable by Act 8 & 9 Vict. c. 94. § 25., to H. Majesty's Receiver General in the said Isle of Man, and to be applied for the lawful purposes of the harbour commissioners therein mentioned, shall and may be retained and paid by the collector of customs of the said isle, out of the duties of customs collected in the said isle, as herein-before provided.—§ 354.

Additional Allowance for Public Works in the Isle of Man.—In addition to the deductions from the customs duties herein-before provided for, there shall be set aside annually a sum equal to 1-9th part of the amount derived from such duties, to be applied by the Commissioners of the Treasury in effecting improvements in the harbours and other public works in the Isle of Man, the necessary repairs and improvements in the harbours taking priority to other public works; and it shall be lawful for the Court of Tynwald from time to time to determine what improvements and public works shall be so undertaken, the lieutenant-governor having a veto upon such decision.—§ 355.

MANGANESE (Ger. *Braunstein, Glasseise;* Du. *Bruinsteen;* Fr. *Manganèse, Magalese, Savon du verre;* It. *Manganesia;* Sp. *Manganesia;* Lat. *Magnesia nigra, Manganesium*), a metal which, when pure, is of a greyish white colour, like cast-iron, and has a good deal of brilliancy. Its texture is granular; it has neither taste nor smell; it is softer than cast-iron, and may be filed; its specific gravity is 8. It is very brittle, and can neither be hammered nor drawn out into wire. Its tenacity is unknown. When exposed to the air, it attracts oxygen with considerable rapidity. It soon loses its lustre, and becomes grey, violet, brown, and at last black. These changes take place still more rapidly if the metal be heated in an open vessel. Ores of manganese are common in Devonshire, Somersetshire, &c. The ore of manganese, known in Derbyshire by the name of *black wadd*, is remarkable for its spontaneous inflammation with oil. Oxide of manganese is of considerable use; it is employed in making oxymuriatic acid, for forming bleaching liquor. It is also used in glazing black earthenware, for giving colours to enamels, and in the manufacture of porcelain. It is the substance generally used by chemists for obtaining oxygen gas.—(*Thomson's Chemistry, &c.*)

MANGEL-WURZEL, OR FIELD BEET (Fr. *Betteraves;* Ger. *Mangold Wurzel;* It. *Biettola*), a mongrel between the red and white beet. It has been a good deal cultivated in France, Germany, and Switzerland, partly as food for cattle, and partly to be used in distillation, and in the extraction of sugar. Its culture in Great Britain is very recent; and Mr. Loudon questions whether it has any advantages over the turnip for general agricultural purposes. The preparation of the soil is exactly the same as for turnips, and immense crops are raised on strong clays. The produce per acre is about the same as that of the Swedish turnip; it is applied almost entirely to the fattening of stock, and the feeding of milch cows.—(*Loudon's Encyc. of Agriculture.*)

MANNA (*Fr. Manne;* Ger. *Mannaesche;* It. *Manna*), the concrete juice of the *Fraxinus ornus*, a species of ash growing in the south of Europe. The juice exudes

spontaneously in warm dry weather, and concretes into whitish tears; but the greater part of the manna of commerce is obtained by making incisions in the tree, and gathering the juice in baskets, where it forms irregular masses of a reddish or brownish colour, often full of impurities. Manna is imported in chests, principally from Sicily and Calabria. The best is in oblong pieces or flakes, moderately dry, friable, light, of a whitish or pale yellow colour, and in some degree transparent; the inferior kinds are moist, unctuous, and brown. It has a slight peculiar odour, and a sweet taste, with some degree of bitterness not very pleasant, and leaving a nauseous impression on the tongue. —(*Thomson's Dispensatory.*)

MANIFEST, in commercial navigation, is a document signed by the master, containing the name or names of the places where the goods on board have been laden, and the place or places for which they are respectively destined; the name and tonnage of the vessel, the name of the master, and the name of the place to which the vessel belongs; a particular account and description of all the packages on board, with the marks and numbers thereon, the goods contained in such packages, the names of the respective shippers and consignees, as far as such particulars are known to the master, &c. A separate manifest is required for tobacco. The manifest must be made out, dated, and signed by the captain, at the place or places where the goods, or any part of the goods, are taken on board.—(See IMPORTATION and EXPORTATION.)

MANILLA, the capital of Luçonia, the largest of the Philippine Islands, and the principal settlement of the Spaniards in the East, in lat. 14° 36′ 8″ N., lon. 120° 53½′ E. Population about 100,000, of whom from 4,000 to 5,000 may be Europeans. Manilla is built on the shore of a spacious bay of the same name, at the mouth of a river navigable for small vessels a considerable way into the interior. The smaller class of ships anchor in Manilla roads, in 5 fathoms, the north bastion bearing N. 37° E., the fishery stakes at the river's mouth N. 18° E., distant about a mile; but large ships anchor at Cavita, about 3 leagues to the southward, where there is a good harbour, well sheltered from the W. and S. W. winds. The arsenal is at Cavita, which is defended by Fort St. Philip, the strongest fortress on the islands. The city is surrounded by a wall and towers, and some of the bastions are well furnished with artillery.

Though situated within the tropics, the climate of the Philippines is sufficiently temperate; the only considerable disadvantage under which they labour in this respect being that the principal part of the group comes within the range of the typhoons. The soil is of very different qualities; but for the most part singularly fertile. They are rich in mineral, vegetable, and animal productions. It is stated in a statistical account of the Philippines, published at Manilla in 1818 and 1819, that the entire population of the islands amounted to 2,249,852, of which 1,376,222 belonged to Luçonia. But this return is believed to have been underrated; and the population having increased very considerably in the interval, it is now estimated at about 4,000,000. There are some, but not many, Chinese settlers, and but few Europeans. The natives are said to be the most active, bold, and energetic, of any belonging to the Eastern Archipelago. "These people," says a most intelligent navigator, "appear in no respect inferior to those of Europe. They cultivate the earth like men of understanding; are carpenters, joiners, smiths, goldsmiths, weavers, masons, &c. I have walked through their villages, and found them kind, hospitable, and communicative; and though the Spaniards speak of and treat them with contempt, I perceived that the vices they attributed to the Indians, ought rather to be imputed to the government they have themselves established."—(*Voyage de M. De la Perouse*, c. 15.)

The trade of the Philippines has increased very rapidly of late years. The imports principally consist of cotton stuffs and yarn, iron and hardware, woollens and worsteds, machinery, wines and spirits, furniture, arms and ammunition, apparel, slops, &c. By far the largest portion of the imports is supplied by the U. Kingdom; but owing to the high discriminating duties in favour of goods imported on Spanish bottoms, a large proportion of the British goods are brought in Spanish ships from Singapore. In 1856 the imports of British produce were valued at 1,575,000*l.*, and the exports of Philippine produce on British account at 1,370,000*l.* The Americans export produce worth about 1,000,000*l.*; and as their imports are a mere trifle, the balance is extinguished by drafts on London. Manilla has, also, an extensive and increasing trade with China, Singapore, and Java, Australia, India, &c.

The quantity of rice and paddy shipped to China from the islands cannot be ascertained with any degree of exactness; what goes from Manilla is very small, because, before arriving there, it has, by its transport expenses, added to the price at which it is obtainable in the districts where it is produced, which, of course, prevents its being shipped from the capital. Probably, however, about a million coyans, each of which, one with another, weighs about a China pecul, or 133⅓ lbs., may be annually exported. The export is regulated by the supposed scarcity or abundance of food in the country.—(*M'Micking's Manilla*, p. 270.)

But the exports have increased very greatly since 1850. Thus the exports of sugar to England and Australia only amounted in 1856 to 626,075 piculs, the whole exports of the year having exceeded 50,000 tons. The exports of hemp during the same year amounted to 21,986 tons, of which by far the largest portion went to the U. States.—(See the valuable *Consular Report* of Mr. Farreu, for 1856.) We subjoin an

Account of the Quantities and Destination of the Produce exported from Manilla in 1850.

Port Charges.—On foreign vessels, 2 rs. per ton, and one-half on such as neither load nor unload cargo, beside fees amounting from $5 to $15, according to the size of vessels.

Import Duties.— Spanish commodities, by Spanish vessels, pay 3 per cent. *ad valorem*, and 8 by foreign. Foreign commodities, by foreign vessels, 14 per cent., and 7 by Spanish; in general, being 8 per cent. under national flag from Singapore, and 9 from China. Spirits and strong liquors, produce of Spain, by Spanish vessels, 10 per cent., and 25 by foreign; if they be foreign produce, by Spanish vessels, 30 per cent., and 60 by foreign. Cider and beer, produce of Spain, by Spanish vessels, 5 per cent., and 10 by foreign; if they be foreign produce, by Spanish vessels, 20, and 25 foreign. All Spanish wines, by national vessels, 3 per cent., and 8 by foreign. Foreign wines, by Spanish vessels, 40 per cent., and 50 by foreign, except champagne, which pays, by Spanish vessels, 7 per cent., and 14 by foreign. Cotton twist, grey, black, blue, and purple—knives, or bolos, such as the natives use—ready-made clothes, boots, shoes, preserved fruits, confectionery and vinegar, by Spanish vessels, 20 per cent., and 30 by foreign. British and other foreign cotton and silk manufactures, made in imitation of native cloths, chiefly stripes or checks of black, blue, and purple colours, Madras and Bengal, grey, white, and printed cottons, towels, table napkins, and table cloths, 15 per cent. by Spanish vessels, and 25 by foreign. Beche de mer, rattans, diamonds, tortoiseshell, mother-o'-pearl shell, and birds' nests, 1 per cent. by Spanish vessels, and 2 by foreign. Machinery of all sorts for the promotion of the industry of the country, cotton twist of red, rose, yellow, and green colours, gold and silver, coined or uncoined, plants and seeds, free. Tropical productions similar to those of the Philippines, also arrack and gunpowder, are prohibited. Opium is only admitted to be deposited for re-exportation. Swords, fowling-pieces, muskets, pistols, and warlike stores may be deposited for re-export, and cannot be introduced without the special license of government; but cannon and dress swords are admitted.

Export Duties.— Commodities and produce of every description to Spain, by national vessels, pay 1 per cent., and 2 by foreign. Elsewhere, 1½ by Spanish vessels, and 3 by foreign. Hemp, by national vessels to whatever destination, 1 per cent., and 2 by foreign. Rice, by Spanish vessels, free, and 4½ per cent. by foreign. Manufactured tobacco, and cordage of Manilla hemp, free by all flags. Gold dust, gold in bars, and silver in bars, free.

Entrepôt Duties.— One per cent. *ad valorem*, and 1 per cent. at the exportation, with 1 per cent. more if the commodities should be kept there more than twelve months, two years being the longest time allowed for it.

Port and Custom-house Regulations.— Vessels newly arrived are not to communicate with the shore until having been visited by the port captain's boat; and within thirty hours after this visit, a manifest must be presented, stating packages, marks, and numbers, but the vessel may retain her cargo ten days in transit without stating whether for consumption or deposit, and without being obliged to land or incurring any charge on the same, except gunpowder, pocket pistols, and forbidden arms.

Terms for Sales and Purchases.—Sales and purchases made, duty paid, at three to five months' credit, occasionally at 2½ per cent. discount for prompt payment, and exports are bought for cash.

The principal currency of Manilla consists of Spanish dollars, of 8 reals and 96 grains, but S. American dollars are also current. The weights in use are the Spanish lb., which is nearly 2 per cent. heavier than the English; the arroba=25¼ Eng. lbs. nearly; the quintal=102 lbs.; and the pecul of 5 arrobas or 1¼ cwt. English. The coyan is a measure for rice, &c., varying from 96 to 135 lbs. According to a recent list, there are in Manilla 47 Spanish merchants and 11 foreign firms. The Spanish merchants have a chamber of commerce, and a joint-stock insurance society. The U. States, France, and Belgium have consuls, and each of the Canton marine insurance companies has an agent here. There are, however, neither fire nor life offices nor agencies; nor is any newspaper, price-current, or other periodical publication issued in Manilla.

Considering the great fertility and varied productions of the Philippines, and their peculiarly favourable situation for carrying on commerce, the limited extent of their trade, even with its late increase, may excite surprise. This, however, is entirely a consequence of the wretched policy of the Spanish government, which persevered until very recently in excluding all foreign ships from the ports of the Philippines, confining the trade between them and Mexico and S. America to a single ship! Even ships and settlers from China were excluded. "Provisions," says La Perouse, "of all kinds are in the greatest abundance here, and extremely cheap; but clothing, European hardware, and furniture bear an excessively high price. The want of competition, together with prohibitions and restraints of every kind laid on commerce, *render the productions and merchandise of India and China at least as dear as in Europe!*" Happily, however, this miserable policy, the effects of which have been admirably depicted by M. de la Perouse, has been materially modified of late years. The events of the revolutionary war destroyed for ever the old colonial system of Spain; and the ships of all nations are now freely admitted into Manilla and the other ports in the Philippines. An unprecedented stimulus has, in consequence, been given to all sorts of industry; and its progress will no doubt become more rapid, according as a wider experience and acquaintance with foreigners makes the natives better aware of the advantages of commerce and industry, and disabuses them of the prejudices of which they have been so long the slaves.

MARBLE (Ger. Rus. and Lat. *Marmor*; Du. *Marmer*; Fr. *Marbre*; It. *Marmo*; Sp. *Marmol*), a genus of fossils, composed chiefly of lime; being a bright and beautiful stone, moderately hard, not giving fire with steel, fermenting with and soluble in acid menstrua, and calcining in a slight fire.

The colours by which marbles are distinguished are almost innumerable. Some are quite black; others, again, are of a snowy white; some are greenish; others greyish, reddish, bluish, yellowish, &c.; while some are variegated and spotted with many different colours and shades of colour. The finest solid modern marbles are those of Italy, Blankenburg, France, and Flanders. Great quantities of very beau-

tiful marble have been lately discovered at Portsoy in Banffshire, and at Tiree and other places in the Western Isles. Kilkenny, in Ireland, has abundance of beautiful black marble intermixed with white spots, called *Kilkenny marble*. Derbyshire abounds in this mineral. Near Kemlyn-bay, in Anglesea, there is a quarry of beautiful marble called *verde di Corsica*, from its also being found in Corsica. Its colours are green, black, white, and dull purple, irregularly disposed. Italy produces the most valuable marble, and its exportation makes a considerable branch of her foreign commerce. The black and the milk-white marble of Carara, in the duchy of Massa, are particularly esteemed.

The marbles of Germany, Norway, and Sweden are very inferior, being mixed with a sort of scaly limestone.

Marble is of so hard, compact, and fine a texture, as readily to take a beautiful polish. That most esteemed by statuaries is brought from the island of Paros, in the Archipelago; it was employed by Praxiteles and Phidias, both of whom were natives of that island; whence also the famous Arundelian marbles were brought. The marble of Carara is likewise in high repute among sculptors.

The specific gravity of marble is from 2,700 to 2,800. Black marble owes its colour to a slight mixture of iron.

MARITIME LAW. By maritime law is meant the law relating to harbours, ships, and seamen. It forms an important branch of the commercial law of all maritime nations. It is divided into a variety of different departments; such as those with respect to harbours, the property of ships, the duties and rights of masters and seamen, contracts of affreightment, average, salvage, &c. The reader will find those subjects treated of under their respective heads.

Sketch of the Progress of Maritime Law. — The earliest system of maritime law was supplied by the Rhodians, several centuries before the Christian æra. The most celebrated authors of antiquity have spoken in high terms of the wisdom of the Rhodian laws; luckily, however, we are not wholly left, in forming our opinion upon them, to the vague though commendatory statements of Cicero and Strabo. — (*Cicero pro Lege Manilia; Strab.* lib. xiv.) The laws of Rhodes were adopted by Augustus into the legislation of Rome; and such was the estimation in which they were held, that the Emperor Antoninus, being solicited to decide a contested point with respect to shipping, is reported to have answered, that it ought to be decided by the Rhodian laws, which were of paramount authority in such cases, unless they happened to be directly at variance with some regulation of the Roman law. — ("*Ego quidem mundi dominus, lex autem maris legis id Rhodia, qua de rebus nauticis præscripta est, judicetur, quatenus nulla nostrarum legum adversatur. Hoc idem Divus quoque Augustus judicavit.*") The rule of the Rhodian law with respect to average contributions in the event of a sacrifice being made at sea for the safety of the ship and cargo, is expressly laid down in the Digest (lib. xiv. tit. 2.); and the most probable conclusion seems to be, that most of the regulations as to maritime affairs embodied in the compilations of Justinian have been derived from the same source. The regulations as to average adopted by all modern nations, are borrowed, with hardly any alteration, from the Roman, or rather, as we have seen, from the Rhodian law! — a conclusive proof of the sagacity of those by whom they had been originally framed. The only authentic fragments of the Rhodian laws are those in the Digest. The collection entitled *Jus navale Rhodiorum*, published at Bâle in 1561, is now admitted by all critics to be spurious.

The first modern code of maritime law is said to have been compiled at Amalphi, in Italy, a city at present in ruins; but which, besides being early distinguished for its commerce, will be for ever famous for the discovery of the Pandects, and the supposed invention of the mariner's compass. The Amalphitan code is said to have been denominated *Tabula Amalphitana*. But if such a body of law really existed, it is singular that it should never have been published, nor even any extracts from it. M. Pardessus has shown that all the authors who have referred to the Amalphitan code and asserted its existence, have copied the statement of Freccia, in his book *De Subfeudis*. — (*Collection des Loix Maritimes*, tome i. p. 145.) And as Freccia assures us that the Amalphitan code continued to be followed in Naples at the time when he wrote (1570), it is difficult to suppose that it could have entirely disappeared; and it seems most probable, as nothing peculiar to it has ever transpired, that it consisted principally of the regulations laid down in the Roman law, which, it is known, preserved their ascendancy for a longer period in the south of Italy than anywhere else.

But, besides Amalphi, Venice, Marseilles, Pisa, Genoa, Barcelona, Valencia, and other towns of the Mediterranean, were early distinguished for the extent to which they carried commerce and navigation. In the absence of any positive information on the subject, it seems reasonable to suppose that their maritime laws would be principally borrowed from those of Rome, but with such alterations and modifications as might be deemed requisite to accommodate them to the particular views of each state. But whether in this or in some other way, it is certain that various conflicting regulations were established, which led to much confusion and uncertainty; and the experience of the inconveniences thence arising, doubtless contributed to the universal adoption of the *Consolato del Mare* as a code of maritime law. Nothing certain is known as to the origin of this code. Azuni (*Droit Maritime de l'Europe*, tome i. pp. 414—439., or rather Jorio, *Codice Ferdinando*, from whose work a large proportion of Azuni's is literally translated) contends, in a very able dissertation, that the Pisans are entitled to the glory

of having compiled the whole, or at least the greater part, of the *Consolato del Mare*. On the other hand, Don Antonio de Capmany, in his learned and excellent work on the commerce of Barcelona — (*Antiguo Comercio de Barcelona*, tome i. pp. 170—183.), has endeavoured to show that the *Consolato* was compiled at Barcelona; and that it contains the rules according to which the consuls, which the Barcelonese had established in foreign places so early as 1268, were to render their decisions. It is certain that the *Consolato* was printed for the first time at Barcelona, in 1502; and that the early Italian and French editions are translations from the Catalan. Azuni has, indeed, sufficiently proved, that the Pisans had a code of maritime laws at a very early period, and that several of the regulations in it are substantially the same as those in the *Consolato*. But it does not appear that the Barcelonese were aware of the regulations of the Pisans, or that the resemblance between them and those in the *Consolato* is more than accidental; or may not fairly be ascribed to the concurrence that can hardly fail to obtain among well-informed persons legislating upon the same topics, and influenced by principles and practices derived from the civil law.

M. Pardessus, in the second volume of his excellent work already referred to, appears to have been sufficiently disposed, had there been any grounds to go upon, to set up a claim in favour of Marseilles to the honour of being the birthplace of the *Consolato*; but he candidly admits that such a pretension could not be supported, and unwillingly adheres to Capmany's opinion. — "Quoique Français," says he, "quoique portée par des sentimens de reconnoissance, qu'aucun évènement ne sauroit affoiblir, à faire valoir tout ce qui est en faveur de Marseilles, je dois reconnoître franchement que les probabilités l'emportent en faveur de Barcelone." — (Tome ii. p. 24.)

But to whichever city the honour of compiling the *Consolato* may be due, there can be no doubt that its antiquity has been greatly exaggerated. It is affirmed, in a preface to the different editions, that it was solemnly accepted, subscribed, and promulgated, as a body of maritime law, by the Holy See in 1075, and by the kings of France and other potentates at different periods between 1075 and 1270. But Capmany, Azuni, and Pardessus have shown in the clearest and most satisfactory manner that the circumstances alluded to in this preface could not possibly have taken place, and that it is wholly unworthy of attention. The most probable opinion seems to be, that it was compiled, and began to be introduced, about the end of the 13th or the beginning of the 14th century. And notwithstanding its prolixity, and the want of precision and clearness, the correspondence of the greater number of its rules with the ascertained principles of justice and public utility, gradually led, without the intervention of any agreement, to its adoption as a system of maritime jurisprudence by all the nations contiguous to the Mediterranean. It is still of high authority. Casaregis says of it, though, perhaps, too strongly, "*Consulatus maris, in materiis maritimis, tanquam universalis consuetudo habens vim legis, inviolabiliter attendenda est apud omnes provincias et nationes.* — (Disc. 218. n. 12.)

The collection of sea laws next in celebrity, but anterior, perhaps, in point of time, is that denominated the *Roole des Jugements d'Oleron*. There is as much diversity of opinion as to the origin of these laws, as there is with respect to the origin of the *Consolato*. The prevailing opinion in Great Britain has been, that they were compiled by direction of Queen Eleanor, wife of Henry II., in her quality of Duchess of Guienne; and that they were afterwards enlarged and improved by her son Richard I., at his return from the Holy Land: but this statement is now admitted to rest on no good foundation. The most probable theory seems to be, that they are a collection of the rules or practices followed at the principal French ports on the Atlantic, as Bordeaux, Rochelle, St. Malo, &c. They contain, indeed, rules that are essential to all maritime transactions, wherever they may be carried on; but the references in the code sufficiently prove that it is of French origin. The circumstance of our monarch's having large possessions in France at the period when the Rules of Oleron were collected, naturally facilitated their introduction into England; and they have long enjoyed a very high degree of authority in this country. "I call them the Laws of Oleron," said a great civilian — (*Sir Leoline Jenkins, Charge to the Cinque Ports*), "not but that they are peculiarly enough English, being long since incorporated into the customs and statutes of our admiralties; but the equity of them is so great, and the use and reason of them so general, that they are known and received all the world over by that rather than by any other name." Molloy, however, has more correctly, perhaps, said of the laws of Oleron, that "they never obtained any other or greater force than those of Rhodes formerly did; that is, they were esteemed for the reason and equity found in them, and applied to the case emergent."— (*De Jure Maritimo et Navali*, Introd.)

A code of maritime law issued at Wisby, in the island of Gothland, in the Baltic, has long enjoyed a high reputation in the North. The date of its compilation is uncertain; but it is comparatively modern. It is true that some of the northern jurists contend that the laws of Wisby are older than the Rules of Oleron, and that the latter are chiefly

copied from the former! But it has been repeatedly shown that there is not so much as the shadow of a foundation for this statement. — (See *Pardessus, Collection, &c.* tome i. pp. 425—462.; *Foreign Quarterly Review*, No. 13. art. *Hanseatic League.*) The Laws of Wisby are not certainly older than the latter part of the 14th or beginning of the 15th century; and have obviously been compiled from the *Consolato del Mare*, the Rules of Oleron, and other codes that were then in use. Grotius has spoken of these laws in the most laudatory manner: — "*Quæ de maritimis negotiis*," says he, "*insulæ Gothlandiæ habitatoribus placuerunt, tantum in se habent, tum equitatis, tum prudentiæ, ut omnes oceani accolæ eo, non tanquam proprio, sed velut gentium jure, utantur.*" — (*Prolegomena ad Procopium*, p. 64.)

Besides the codes now mentioned, the ordinances of the Hanse Towns, issued in 1597 and 1614, contain a system of laws relating to navigation that is of great authority. The judgments of Damme, the customs of Amsterdam, &c., are also often quoted.*

But by far the most complete and well digested system of maritime jurisprudence that has ever appeared, is that comprised in the famous *Ordonnance de la Marine* issued by Louis XIV. in 1681. This excellent code was compiled under the direction of M. Colbert, by individuals of great talent and learning, after a careful revision of all the ancient sea laws of France and other countries, and upon consultation with the different parliaments, the courts of admiralty, and the chambers of commerce, of the different towns. It combines whatever experience and the wisdom of ages had shown to be best in the Roman laws, and in the institutions of the modern maritime states of Europe. In the preface to his treatise on the *Law of Shipping*, Lord Tenterden says, — "If the reader should be offended at the frequent references to this ordinance, I must request him to recollect that those references are made to the maritime code of a great commercial nation, which has attributed much of its national prosperity to that code: a code composed in the reign of a politic prince; under the auspices of a wise and enlightened minister; by laborious and learned persons, who selected the most valuable principles of all the maritime laws then existing; and which, in matter, method, and style, is one of the most finished acts of legislation that ever was promulgated."

The ordinance of 1681 was published in 1760, with a detailed and most elaborate commentary by M. Valin, in 2 volumes, 4to. It is impossible which to admire most in this commentary, the learning or the sound good sense of the writer. Lord Mansfield was indebted for no inconsiderable portion of his superior knowledge of the principles of maritime jurisprudence to a careful study of M. Valin's work.

That part of the *Code de Commerce* which treats of maritime affairs, insurance, &c. is copied, with very little alteration, from the ordinance of 1681. The few changes that have been made are not always improvements.

No system or code of maritime law has ever been issued by authority in Great Britain. The laws and practices that now obtain amongst us in reference to maritime affairs have been founded principally on the practices of merchants, the principles laid down in the civil law, the Laws of Oleron and Wisby, the works of distinguished jurisconsults, the judicial decisions of our own and foreign countries, &c. A law so constructed has necessarily been in a progressive state of improvement; and, though still susceptible of amendment, it corresponds, at this moment, more nearly, perhaps, than any other system of maritime law, with those universally recognised principles of justice and general convenience by which the transactions of merchants and navigators ought to be regulated.

The decisions of Lord Mansfield did much to fix the principles, and to improve and perfect the maritime law of England. It is also under great obligations to Lord Stowell. The decisions of the latter chiefly, indeed, respect questions of neutrality, growing out of the conflicting pretensions of belligerents and neutrals during the late war; but the principles and doctrines which he unfolds in treating those questions, throw a strong and steady light on those branches of maritime law. It has occasionally, indeed, been alleged, — and the allegation is probably, in some degree well founded, — that his Lordship has conceded too much to the claims of belligerents. Still, however, his judgments must be regarded, allowing for this excusable bias, as among the noblest monuments of judicial wisdom of which any country can boast. "They will be contemplated," says Mr. Serjeant Marshall, "with applause and veneration, as long as depth of learning, soundness of argument, enlightened wisdom, and the chaste beauties of eloquence, hold any place in the estimation of mankind."—(*On Insurance*, Prelim. Disc.)

The "Treatise of the Law relative to Merchant Ships and Seamen," by the late Chief Justice of the Court of King's Bench, does credit to the talents, erudition, and liberality of its noble and learned author. It gives, within a brief compass, a clear and

* A translation of the Law of Oleron, Wisby, and the Hanse Towns, is given in the 3d edition of Malyne's *Lex Mercatoria*, but the edition of them in the work of M. Pardessus, referred to in the text, is infinitely superior to every other.

admirable exposition of the most important branches of our maritime law; and may be consulted with equal facility and advantage by the merchant, the general scholar, and the lawyer. Mr. Serjeant Marshall has entered very fully into some, and has touched upon most points of maritime law, in his work on *Insurance*; and has discussed them with great learning and sagacity. The works of Mr. Justice Park, Mr. Holt, and a few others, are also valuable. Of the earlier treatises, the *Lex Mercatoria* of Malynes is by far the best; and, considering the period of its publication (1622), is a very extraordinary performance.

Statutes with respect to Importation and Exportation, Navigation, &c. — The preceding remarks refer merely to the principles, or leading doctrines, of our maritime law. These, however, have often been very much modified by statutory enactments; and the excessive multiplication of acts of parliament suspending, repealing, or altering parts of other acts, has often involved our commercial and maritime law in almost inextricable confusion, and been most injurious to the public interests. No one, indeed, who is not pretty conversant with the subject, would readily imagine to what an extent this abuse has sometimes been carried. From the Revolution down to 1786, some hundreds of acts were passed, each enacting some addition, diminution, or change, in the duties, drawbacks, bounties, and regulations previously existing in the customs. In consequence, the customs laws became so intricate and unintelligible, that hardly one merchant in fifty could tell the exact amount of duty affecting any article, or the course to be followed either in entering or clearing out vessels; being obliged to leave it entirely to the clerks of the Custom-house to calculate the amount of duties, and to direct him how to proceed so as to avoid forfeiting the goods and the ship! and yet, so powerful is the influence of habit in procuring toleration for the most pernicious absurdities, that this monstrous abuse was allowed to go on increasing for 50 years after it had been denounced as intolerable. Mr. Pitt has the merit of having introduced something like order into this chaos. Under his auspices, all the separate customs duties existing in 1787 were repealed, and new ones substituted in their stead; consisting, in most instances, of the equivalents, so far at least as they could be ascertained, of the old duties. In carrying this measure into effect, the House of Commons passed no fewer than 3,000 resolutions. The regulations as to entries and clearances were also simplified.

The advantages resulting from this measure were very great; but during the war, so many new duties and regulations were passed, that the necessity for a fresh consolidation became again very urgent, and was effected in 1819. It was not, however, in the customs department only, or in the mere article of duties, that the merchant and ship owners were bewildered by the multiplicity of statutory regulations. There was not a single branch of the law regulating their transactions that escaped the rage for legislation. Previously to 1822, no fewer than 113 statutes had been passed relating to the fisheries; and the makers and buyers of sails and cordage were supposed to be familiar with the various obscure and contradictory regulations embodied in the *twenty-three* acts of parliament relating to these articles! But the enormity of the abuse will be rendered more apparent, by laying before the reader the following extract from the *Report of the Lords' Committee on Foreign Trade in* 1820.

"Before," say their Lordships, "your committee proceed to advert to the points which have been the principal objects of their inquiry, they are anxious to call the attention of the House to the excessive accumulation and complexity of the laws under which the commerce of the country is regulated, with which they were forcibly impressed in the very earliest stage of their proceedings. These laws, passed at different periods, and many of them arising out of temporary circumstances, amount, as stated in a recent computation of them, to upwards of *two thousand*, of which no less than 1,100 were in force in 1815; and many additions have been since made. After such a statement, it will not appear extraordinary that it should be mater of complaint by the British merchant, that, so far from the course in which he is to guide his transactions being plain and simple—so far from being able to undertake his operations, and to avail himself of favourable openings, as they arise, with promptitude and confidence—he is frequently reduced to the necessity of resorting to the services of professional advisers, to ascertain what he may venture to do, and what he must avoid, before he is able to embark in his commercial adventures with the assurance of being secure from the consequences of an infringement of the law. If this be the case (as is stated to your committee) with the most experienced among the merchants, even in England, in how much greater a degree must the same perplexity and apprehension of danger operate in foreign countries and on foreign merchants, whose acquaintance with our statute book must be supposed to be comparatively limited, and who are destitute of the professional authority which the merchant at home may at all times consult for his direction? When it is recollected, besides, that a trivial unintentional deviation from the strict letter of the acts of parliament may expose a ship and cargo to the inconvenience of seizure, which (whether

sustained or abandoned) is attended always with delay and expense, and frequently followed by litigation, it cannot be doubted that such a state of the law must have the most prejudicial influence both upon commercial enterprise in the country, and upon our mercantile relations and intercourse with foreign nations; and perhaps no service more valuable could be rendered to the trade of the empire, nor any measure more effectually contribute to promote the objects contemplated by the House, in the appointment of this committee, than an accurate revision of this vast and confused mass of legislation; and the establishment of some certain, simple, and consistent principles, to which all the regulations of commerce might be referred, and under which the transactions of merchants engaged in the trade of the U.K. might be conducted with facility, safety, and confidence." (p. 4.)

Since this Report was printed, a very considerable progress has been made in simplifying and clearing up the statute law, on the principles laid down in it. The law as to shipping and navigation has been particularly improved. The principles laid down in the famous navigation acts of 1650 and 1660 were, indeed, sufficiently distinct and obvious; but when these acts were passed, there were above 200 statutes in existence, many of them antiquated and contradictory, which they did not repeal, except in so far as the regulations in them might be inconsistent with those in the new acts. But besides these, a number of statutes were passed almost in every session since 1660, explaining, limiting, extending, or modifying, in one way or other, some of the provisions of the navigation acts; so that ultimately there were questions perpetually arising, as to which it was very difficult to discover the precise law. On such occasions, recourse was often had to the courts; and the good sense and equity which generally characterised their decisions mitigated the mischievous consequences resulting from the uncertainty of the statute law, and even gave it the appearance of consistency. Latterly, however, this uncertainty has been well nigh removed. A bill introduced and carried through parliament in 1824 repealed above 200 antiquated and contradictory statutes; and the new customs and navigation acts passed in the following year were drawn up with a brevity and precision which do honour to the memory of their compiler, the late Mr. Hume, of the Board of Trade. But various alterations having been subsequently made in the customs' laws, new statutes embodying these alterations were passed in 1833, and again in 1845. And a still more perfect and complete consolidation has been effected by the Customs Consolidation Act of 1853, the 16 & 17 Vict. c. 107. It has the two great recommendations of being at once brief and perspicuous. It embraces the whole statute law with respect to the importation and exportation of commodities; the coasting and colonial trades; smuggling, &c. The law relating to ships and seamen, which, down to last year, was in a very confused and contradictory state, has, also, been digested under its different heads, and embodied in a single statute, the Mercantile Shipping Act of 1854, the 17 & 18 Vict. c. 104. This statute, which contains no fewer than 548 clauses, might, we think, be advantageously compressed; but as it is, it is a vast improvement on the previous state of the statute law on the subject.

It may be worth while observing, that hardly a session passes without giving birth to more or fewer acts, making certain changes or modifications in the customs' laws. Where these changes apply only to some particular emergency, without affecting the general principles or rules laid down in the statutes, there can be no doubt that they should be embodied in separate acts; but where any modification or alteration is to be made in the principles of the law, the better way, as it appears to us, would be to introduce it directly into the leading act on the subject — re-enacting it in an amended or altered form. In no other way is it possible to preserve that unity and clearness which are so very desirable. The multiplication of statutes is a very great evil, not only from the difficulty of ascertaining the exact degree in which one modifies another, but from its invariably leading to the enactment of contradictory clauses. The property and transactions of merchants ought not to depend upon the subtleties and niceties of forced constructions, but upon plain and obvious rules, about which there can be no mistake. It would, however, be idle to expect that such rules can ever be deduced from the conflicting provisions of a number of statutes: those in the same statute are not always in harmony with each other.

MARK, OR MARC, a weight used in several parts of Europe, for various commodities, especially gold and silver.

In France the mark was divided into 8 oz. = 64 drachms=192 deniers or pennyweights = 4,608 grains. In Holland, the mark weight was also called Troy weight, and was equal to that of France. When gold and silver are sold by the mark, it is divided into 24 carats.

The pound, or *livre, poids de marc*, the weight most commonly used in retail dealings throughout France, previous to the Revolution, was equal to 2 marcs, and consequently contained 16 oz.=128 drs.= 384 den.=9,216 gr. One kilogramme is nearly equal to 2 livres.—Subjoined is a Table of livres, *poids de marc*, from 1 to 10, converted into kilogrammes. Any greater number may be learned by a simple multiplication and addition.

Livres.		*Kilog.*	*Livres.*		*Kilog.*	*Livres.*		*Kilog.*	*Livres.*		*Kilog.*
1	=	0·4895	4	=	1·9580	7	=	3·4265	9	=	4·4056
2	=	0·9790	5	=	2·4475	8	=	3·9160	10	=	4·8951
3	=	1·4685	6	=	2·9370						

MARK, a term sometimes used among us for a money account, and in some other

countries for a coin. The English mark is ⅔ds of a pound sterling, or 13*s.* 4*d.*; and the Scotch mark is ⅔ds of a pound Scotch. The mark Lubs, or Lubeck mark, used at Hamburg, is a money of account, equal to 14⅔*d.* sterling.

MARKET, a public place in a city or town, where provisions are sold. No market is to be kept within 7 miles of the city of London; but all butchers, victuallers, &c. may hire stalls and standings in the flesh-markets there, and sell meat and other provisions. Every person who has a market is entitled to receive toll for the things sold in it; and by ancient custom, for things standing in the market, though not sold; but those who keep a market in any other manner than it is granted, or extort tolls or fees where none are due, forfeit the same.—(See FAIRS.)

MARSEILLES. a large commercial city and sea-port of France, on the Mediterranean, lat. 43° 17′ 49″ N., lon. 5° 22½′ E. Population, in 1851, inc. suburbs, 195,257.

Harbour.—The harbour, the access to which is defended by several strong fortifications, is in the centre of the city, forming a basin 525 fathoms in length, by about 150 do. in breadth. The tide is hardly sensible; but the depth of water at the entrance to the harbour varies from 16 to 18 feet, being lowest when the wind is N. W., and highest when it is S. W. Within the basin the depth of water varies from 12 to 24 feet, being shallowest on the north, and deepest on the south side. Dredging machines are constantly at work to clear out the mud, and to prevent the harbour from filling up. Though not accessible to the largest class of ships, Marseilles is one of the best and safest ports in the world for moderate-sized merchantmen, of which it will accommodate above 1000. Ships in the basin lie close alongside the quays; and there is every facility for getting them speedily loaded and unloaded. The Isles de Rattoneau and Pomegues, and the strongly fortified islet or rock of If, lie W. S. W. from the port; the latter, which is the nearest to it, being only 1¾ mile distant, and not more than ¾ of a mile from the projecting point of land to the south of the city. There is good anchorage ground for men-of-war and other large ships between the Isles de Rattoneau and Pomegues, to the west of the Isle d'If. When coming from the south, it is usual to make the Isle de Planier, in lat. 43° 11′ 54″ N., lon. 5° 13′ 59″ E. A light-house erected on this island is 131 feet high; the flashes of the light, which is a revolving one, succeed each other every ½ minute, and in clear weather it may be seen 7 leagues off. Ships that have made the Isle de Planier, or that of Le Maire, lying east from it about 4½ miles, steer northerly for the Isle d'If, distant about 7 miles from each, and having got within ¼ or ½ a mile of it, heave to for a pilot, who carries them into harbour; it is not, however, obligatory on ships to take a pilot on board; but being obliged to pay for one whether they avail themselves of his services or not, they seldom dispense with them. The charge is 4 sous per ton in, and 2 sous per do. out, for French vessels, and the vessels having reciprocity treaties with France. There is a light-house in the fort St. Jean, on the north side of the entrance to the port. The *lazaretto*, which is one of the best in Europe, lies a little to the north of the city; and there is an hospital on Rattoneau Island, for individuals whose health is dubious. With the exception of the above charge for pilotage, and the charges for such vessels as perform quarantine, there are no port charges on ships entering at or clearing out from Marseilles.

Usages, &c.—As soon as the master has, on his arrival, made his declaration at the Health Office, and received *pratique*, he is directed to an office close by, called the Patache, where he makes two similar declarations, the one for the captain of the port, and the other for the custom-house; the day and hour of the latter being made is marked, in order to ascertain if the regular manifest of his cargo is delivered at the custom-house within 24 hours after, as required by law. As soon as these declarations are made, the master is accosted by one or more public brokers, who alone are authorised by law to enter ships at the custom-house and other public offices, and to interpret, if it be necessary, for the master. The broker whom he may select then gives the master all the necessary information respecting the usages of the port as regards the ship and cargo, and goes through all the formalities respecting them that the law or local regulations require. Independent of the regular manifest which it is usual in all ports for the master to give in to the custom-house, he is here required to give in a full and complete list of all the ship's stores, provisions, &c. that he has on board for his own use, and that of his crew; and he cannot be too careful to make this list as correct as possible, as when it is subsequently verified on board by the custom-house and excise officers, any variation subjects the ship to penalties. This is particularly the case with tobacco, which, being a government monopoly, is watched with the greatest vigilance. *All* the tobacco on board over that which the crew have in their chests for their own use, must be declared, and any attempt at concealment or smuggling is visited with heavy fines. When the ship sails, the stores, provisions, &c., are again examined, and an excise duty charged on such provisions and other exciseable articles as may have been consumed in the port.

No fire or light is allowed on board, and the cooking is all done on shore.

Trade, &c.—Marseilles is a city of great antiquity, and has long enjoyed a very extensive commerce. Havre, partly, no doubt, from its being, as it were, the port of Paris, used to enjoy a greater share of the trade of France; but, notwithstanding the increased importance of the former, it has recently been equalled, and sometimes surpassed, by that of Marseilles. The customs duties collected at Havre in 1853, were 35,061,000 fr., while those collected at Marseilles during the same year amounted, as will be afterwards seen, to 33,790,000 fr.; but in 1851 the preponderance was the other way.

Marseilles is the grand emporium of the South of France, and the centre of 9-10ths of her commerce with the countries of the Mediterranean and Black Sea. The exports consist principally of silk stuffs, wines, brandies, and liqueurs; woollens and linens; madder, oil, soap, refined sugar, perfumery, stationery, verdigris, and all sorts of colonial products. Among the principal imports are sugar, coffee, and other colonial products; dye stuffs; corn from the Black Sea and the north coast of Africa; cotton from Egypt and America; coal, linen, thread, and various descriptions of manufactured goods from England; with hides, wool, tallow, timber, &c. Marseilles engrosses almost the whole trade between France and Algiers. She is now also the principal seat of the intercourse carried on by steamers with Malta, Alexandria, and Constantinople. There belonged to the port, on the 1st January, 1854, 758 sailing vessels of the burden of 78,779 tons; and 56 steamers of the burden of 13,458 tons. Many of the steamers have English-made engines; and some of them have English engineers and burn English coal.

A joint stock bank established here in 1835 has latterly been converted into a branch of the Bank of France; 4,000 shares and 4,000,000 fr. of the stock of the latter having been assigned to its proprietors.

The value of the imports into Marseilles amounted, in 1853, to 267,528,771 fr. (above 10,000,000*l.* sterling), in merchandise, exc. 26,768,870 fr. in gold and silver. The value of the exports of merchandise during the same year amounted to 216,262,366 fr. (above 9,000,000*l.* sterling), and that of the precious metals to 33,301,970 fr. The customs duties for 1853 were, inc. the decimes, 33,790,000 fr.

These statements show that the trade of Marseilles is of much importance. She is, in fact, the principal emporium in S. Europe. And it is not easy to say in how great a degree her trade would be increased, were the French tariff revised and placed on a more liberal footing.

MASTER, in commercial navigation, the person intrusted with the care and navigation of the ship.

Formerly no one was qualified to be the master of a British ship, unless natural-born British subjects or those naturalised by act of parliament, or denizens by letters of denization, &c. But these restrictions no longer exist; and all parties, whether natives or foreigners, provided they have the necessary certificates (see *post*), may be selected to serve as masters.

"The master is the confidential servant or agent of the owners; and in conformity to the rules and maxims of the law of England, *the owners are bound to the performance of every lawful contract made by him relative to the usual employment of the ship.*"—(*Abbott* (Lord Tenterden) *on the Law of Shipping*, part ii. c. 2.)

From this rule of law it follows that the owners are bound to answer for a breach of contract, though committed by the master or mariners against their will, and without their fault.—(*Id.*) Nor can the expediency of this rule be doubted. The owners, by selecting a person as master, hold him forth to the public as worthy of trust and confidence. And in order that this selection may be made with due care, and that all opportunities of fraud and collusion may be obviated, it is indispensable that they should be made responsible for his acts.

The master has power to hypothecate, or pledge, both ship and cargo for *necessary repairs executed in foreign parts* during the course of the voyage; but neither the ship nor cargo can be hypothecated for repairs *executed at home.*

The master has no lien upon the ship for his wages, nor for money advanced by him for stores or repairs. In delivering judgment upon a case of this sort, Lord Mansfield said—"As to wages, there is no particular contract that the ship should be a pledge; there is no usage in trade to that purpose; nor any implication from the nature of the dealing. On the contrary, the law has always considered the captain as contracting personally with the owner; and the case of the captain has, in that respect, been distinguished from that of all other persons belonging to the ship. This rule of law may have its foundation in policy, for the benefit of navigation; for, as ships may be making profit and earning every day, it might be attended with great inconvenience, if, on the change of a captain for misbehaviour, or any other reason, he should be entitled to keep the ship till he is paid. Work done for a ship in England is supposed to be done on the personal credit of the employer: in foreign parts the captain may hypothecate the ship. The defendant might have told the tradesman, that he only acted as an agent, and that they must look to the owner for payment."

The master is bound to employ his whole time and attention in the service of his employers, and is not at liberty to enter into any engagement for his own benefit that may occupy any portion of his time in other concerns; and therefore, if he do so, and the price of such engagement happen to be paid into the hands of his owners, they may retain the money, and he cannot recover from them.—(*Abbott*, part ii. c. 4.)

Wilfully destroying or casting away the ship, or procuring the same to be done by the master or mariners, to the prejudice of the owners, freighters, or insurers; running away with the cargo; and turning pirates; are offences punishable by transportation beyond seas for not less than 15 years, or by imprisonment for not more than 3 years.—(See art. SEAMEN.)

After the voyage has been commenced, the master must proceed direct to the place of his destination, without unnecessarily stopping at any intermediate port, or deviating from the shortest course. No such deviation will be sanctioned, unless it has been occasioned by stress of weather, the want of necessary repair, avoiding enemies or pirates, succouring of ships in distress, sickness of the master or mariners, or the mutiny of the crew.—(*Marshall on Insurance*, book i. c. 6. § 3.) To justify a deviation, the necessity must be real, inevitable, and imperious; and it must not be prolonged one moment after the necessity has ceased. A deviation without such necessity vitiates all insurances upon the ship and cargo, and exposes the owners to an action on the part of the freighters. If a ship be captured in consequence of deviation, the merchant is entitled to recover from the owners the prime cost of the goods, with shipping charges; but he is not entitled to more, unless he can show that the goods were enhanced in value beyond the sum above mentioned.

If a merchant ship has the misfortune to be attacked by pirates or enemies, the master is bound to do his duty as a man of courage and capacity, and to make the best resistance that the comparative strength of his ship and crew will allow.

By the common law, the master has authority over all the mariners on board the ship,—it being their duty to obey his commands, in all lawful matters relating to the navigation of the ship, and the preservation of good order. But the master should in all cases use his authority with moderation, so as to be the father, not the tyrant of his crew. On his return home he may be called upon by action at law, to answer to a mariner he has either beat or imprisoned during the course of the voyage; and unless he show sufficient cause for chastising the mariner, and also that the chastisement was reasonable and moderate, he will be found liable in damages. Should the master strike

a mariner without cause, or use a deadly weapon as an instrument of correction, and death ensue, he will be found guilty, according to the circumstances of the case either of manslaughter or murder.—(*Abbott*, part ii. c. 4.)

The master may by force restrain the commission of great crimes; but he has no jurisdiction over the criminal. His business is to secure his person, and to deliver him over to the proper tribunals.—(See art. SEAMEN.)

Much abuse having arisen from masters improperly leaving seamen in foreign parts, various penalties have been imposed on those guilty of such offences. These are specified in detail in the article SEAMEN; and it, also, contains a full statement of the conduct which masters are bound to follow in the hiring of seamen; in the payment of their wages; in the bringing home deserted seamen from abroad; in the registration of returns respecting seamen; and a variety of other particulars.

The law makes no distinction between carriers by land and carriers by water. The master of a merchant ship is, in the eye of the law, a carrier; and is, as such, bound to take reasonable and proper care of the goods committed to his charge, and to convey them to the place of their destination, *barring only the acts of God and the queen's enemies.*

Every act which may be provided against by ordinary care renders the master responsible. He would not, for example, be liable for damage done to goods on board in consequence of a leak in the ship occasioned by the violence of a tempest, or other accident; but if the leak were occasioned by rats, he would be liable, for these might have been exterminated by ordinary care, as by putting cats on board, &c. On the same principle, if the master run the ship in fair weather against a rock or shallow known to expert mariners, he is responsible; he is, also, liable for any injury done to the cargo by improper or careless stowage.

The master must not take on board any contraband goods, by which the ship and other parts of the cargo may be rendered liable to forfeiture or seizure. Neither must he take on board any false or colourable papers, as this might subject the ship to the risk of capture or detention. But it is his duty to procure and keep on board all the papers and documents required for the manifestation of the ship and cargo, by the law of the countries from and to which the ship is bound, as well by the law of nations in general, as by treaties between particular states. These papers and documents cannot be dispensed with at any time, and are quite essential to the safe navigation of neutral ships during war.—(See LOG (OFFICIAL) and SHIPS' PAPERS.)

It is customary in bills of lading to insert a clause limiting the responsibility of the master and owners, as follows: "*The act of God, the queen's enemies, fire, and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, save risk of boats, as far as ships are liable thereto, excepted.*" When no bill of lading is signed, the master and owners are bound according to the common law.—(See BILLS OF LADING.)

The most difficult part of the msster's duty is when, through the perils of the sea, the attacks of enemies or pirates, or other unforeseen accidents, he is prevented from completing his voyage. If his ship have suffered from storms, and cannot be repaired within a reasonable time, and if the cargo be of a *perishable nature*, he is at *liberty* to employ another ship to convey it to the place of destination. He may do the same if the ship have been wrecked and the cargo saved, or if his own ship be in danger of sinking, and he can get the cargo transferred to another *; and in *extreme cases* he is at liberty to dispose of the cargo for the benefit of its owners. But, to use the words of Lord Chief Justice Tenterden, "the disposal of the cargo by the master is a matter that requires the utmost caution on his part. He should always bear in mind that it is his *duty to convey it to the place of destination.* This is the purpose for which he has been intrusted with it, and this purpose he is bound to accomplish by every reasonable and practical method. What, then, is the master to do, if, by any disaster happening in the course of his voyage, he is unable to carry the goods to the place of destination, or to deliver them there? To this, as a general question, I apprehend no answer can be given. Every case must depend upon its own peculiar circumstances. The conduct proper to

* The most celebrated maritime codes, and the opinions of the ablest writers, have differed considerably as to these points. According to the Rhodian law (Pand. 1. 10. § 1.) the captain is released from all his engagements, if the ship, by the perils of the sea, and without any fault on his part, become incapable of proceeding on her voyage. The laws of Oleron (art. 4.), and those of Wisby (arts. 16. 37. 55.) say that the captain *may hire another ship*; harmonising in this respect with the present law of England. The famous French ordinance of 1681 (tit. *Du Frêt*, art. 11.), and the *Code du Commerce* (art. 296.), *order the captain to hire another ship*; and if he cannot procure one, freight is to be due only for that part of the voyage which has been performed (*pro ratâ itineris peracti*). Valin has objected to this article, and states that practically it meant only that the captain must hire another ship if he would earn the whole freight. Emerigon (tom. i. p. 428.) holds that the captain, being the agent not only of the owners of the ship, but also of the shippers of the goods on board, is bound, in the absence of both, to use his best endeavours to preserve the goods, and to do whatever, in the circumstances, he thinks will most conduce to the interest of all concerned; or what it may be presumed the shippers would do, were they present. This, which seems to be the best and wisest rule, has been laid down by Lords Mansfield and Tenterden, as stated above, and may be regarded as the law of England on this point.

be adopted with respect to perishable goods will be improper with respect to a cargo not perishable: one thing may be fit to be done with fish or fruit, and another with timber or iron: one method may be proper in distant regions, another in the vicinity of the merchant; one in a frequented navigation, another on unfrequented shores. The wreck of the ship is not necessarily followed by an impossibility of sending forward the goods, and does not of itself make their sale a measure of necessity or expedience: much less can the loss of the season, or of the proper course of the voyage, have this effect. An unexpected interdiction of commerce, or a sudden war, may defeat the adventure, and oblige the ship to stop in her course; but neither of these events doth of itself alone make it necessary to sell the cargo at the place to which it may be proper for the ship to resort. In these and many other cases, the master may be discharged of his obligation to deliver the cargo at the place of destination; but it does not therefore follow that he is authorised to sell it, or ought to do so. What, then, is he to do? In general, it may be said, *he is to do that which a wise and prudent man will think most conducive to the benefit of all concerned.* In so doing, he may expect to be safe, because the merchant will not have reason to be dissatisfied; but what this thing will be, no general rules can teach. Some regard may be allowed to the interest of the ship, and of its owners; but the interest of the cargo must not be sacrificed to it. Transhipment for the place of destination, if it be practicable, is the first object, because that is in furtherance of the original purpose: if that be impracticable, return, or a safe deposit, may be expedient. A disadvantageous sale (and almost every sale by the master will be disadvantageous) is the last thing he should think of, because it can only be justified by that necessity which supersedes all human laws.—(*Law of Shipping*, part iii. c. 3.)

The master of a ship is liable for goods of which she is robbed in part; and the reason, as Lord Mansfield stated, is, lest room should be given for collusion, and the master should get himself robbed on purpose, in order that he might share in the spoil. The master is, however, entitled to indemnify himself out of the seamen's wages for losses occasioned by their neglect.

The conditions under which seamen and apprentices are to be taken on board ship, and the obligations of the master with respect to them, are fully set forth in the art. SEAMEN, in this work; and it also contains, as already stated, full details as to the conduct which masters are bound to pursue in regard to a variety of other particulars.

For the duty of the master, as respects Custom-house regulations, see the articles IMPORTATION AND EXPORTATION, QUARANTINE, SMUGGLING, &c.; and for a further discussion of this important subject, see the excellent work of *Lord Tenterden on the Law of Shipping*, part iii. c. 3, &c.; *Chitty on Commercial Law*, vol. iii. c. 8. &c.; and the articles CHARTERPARTY, FREIGHT, &c. in this Dictionary.

Qualification of Masters. Means by which they should be ascertained. — Considering the important nature of the duties which the master of a ship has to perform, it has been customary in some countries to require that all persons, previously to their being nominated to act in that capacity, should undergo an examination by some public board respecting their knowledge of seamanship, and their possession of the various qualifications necessary to act as masters, and that none should be appointed without their being licensed by such board or other competent authorities. We are inclined to think that this practice is consistent with sound policy, and we are glad to have to state that it has recently been adopted in this country. In former editions we observed on this subject as follows, viz.,

"There can, unhappily, be no doubt that the ignorance and incapacity of the masters and inferior officers of ships has been a copious source of disaster. Officers of the Navy have to go through a course of discipline, and are obliged to submit to certain examinations as to their proficiency in seamanship. This, also, was the case with the officers of the East India Company's ships, which were exceedingly well navigated. Indeed, the Company trusted entirely for protection to the goodness of their ships, and the skill of their officers and men; it not being their practice ever to insure. But the masters and officers of ordinary merchant ships, even of those engaged in the conveyance of passengers, are not subjected to any specific training, or regular examination. Everything is left to mere individual investigation and selection; and this, as every one knows, depends almost wholly on accident; or, which is nearly equivalent to it, on the skill, industry, liberality, &c. of the ship-owner. It is sufficiently clear that masters so chosen cannot fail of being, in many instances, very ill qualified for their business. Few, however, have any notion of the extent of the mischief thence arising; but we have been assured by gentlemen of undoubted information, and extensively connected with the business of insurance, that nearly half the losses at sea may be ascribed to the incapacity and carelessness of the masters and crews. Perhaps there may be some exaggeration in this; but, supposing that only a third part, or that 212 out of the 636 vessels wrecked in 1841, were lost through the circumstances referred to, is not that enough, not merely to justify government interfering to avert so great an evil, but to make such interference an imperative duty?

"The interposition of government in a case of this sort is not only absolutely just and necessary, but it is conformable to the highest authority. The famous French ordinance of 1681 has the following article:—"*Aucun ne pourra ci-après être reçu capitaine, maître, ou patron de navire, qu'il n'ait navigué pendant cinq ans, et n'ait été examiné publiquement sur le fait de la navigation, et trouvé capable*

par deux anciens maîtres, en présence des officiers de l'Amirauté et du Professeur de l'Hydrographie, s'il y en a dans le lieu."—(Liv. ii. tit. 1. § 1.) A like article has been inserted in the *Code de Commerce*; and in 1825, the French Government issued an ordinance specifying, in detail, the qualifications that are necessary before any one can obtain a certificate of his fitness to command a ship, either on a foreign or a coasting voyage; the persons who are to examine candidates; and the rules to be observed in the examination. A similar system has been adopted in Prussia; and we cannot entertain a doubt that it would be of the greatest service were it introduced into this country. The authority of the master is so very great, and the trust reposed in him, including not merely the ship and goods of his employers, but the lives of the crew and passengers, so very extensive, that it is the bounden duty of the public to provide, in as far as practicable, that it be not committed to ignorant or incapable hands.

"At present the care of the lives of hundreds of passengers may be committed, without check or control of any sort, and without their knowing anything of the matter, to any incapable blockhead who may be able to prevail on an owner to appoint him to a ship. No doubt it is for the interest of the owner to appoint the best captain he can find; but he may be unable to form a correct estimate of the qualifications necessary for such a situation; and, though this were not the case, hundreds of circumstances may conspire to blind his judgment, and to make him select a master who is really unworthy. Hence the advantage of the preliminary examination by competent parties, which, if made efficient, would certainly afford a powerful guarantee against the chance of an unfit person being appointed.

"We rather incline to think, should we have occasion to notice this important subject on any future occasion, that it will be to announce that some such plan as that which we have ventured to recommend has been adopted. It has, we are glad to say, been approved by the Committee appointed by the House of Commons in 1843 to inquire into the causes and prevention of Shipwrecks. 'Your Committee, after carefully weighing the evidence adduced, consider that, under all the circumstances, it would materially promote science, and prevent the loss of life and property, if a legislative enactment were introduced by government, establishing local boards for the purpose of examining into the abilities, conduct, and character of all who wish to qualify as masters and mates in the merchant service. And your Committee further recommend the establishment of schools for the purpose of teaching navigation in the different seaports, to be supported by a small tonnage duty to be levied on the vessels belonging to such ports.'" —(*Report*, p. 4.)

We have much satisfaction in being able to state that this proposal, for subjecting the masters or commanders of merchant ships to an examination by competent parties, in the view of ascertaining their fitness for undertaking their peculiar duties, was adopted and carried into effect under the Mercantile Marine Act, the 13 & 14 Vict. c. 93. This statute authorised the B. of Trade to establish Local Marine Boards in ports having 30,000 tons or upwards of ships trading to foreign parts. These boards were empowered to examine all candidates for the situation of masters and mates who came before them, in such subjects connected with seamanship, navigation, &c., and in such manner as the B. of Trade may prescribe. In the event of the examiners being satisfied with their proficiency, they are to grant them "certificates of competency." These, however, may be cancelled either from evidence being subsequently had of the incompetency of the parties, or of their drunkenness, tyranny, &c. The Act took effect on the 1st of January, 1851, since which date no foreign-going ship has been cleared out without the master and mate or mates being qualified according to the statute. And there can be no doubt that if the plan be properly carried out, and the examinations be made sufficiently strict and searching, it will be productive of a great deal of good. But if otherwise,—that is, if certificates be given to incompetent parties,—it will be decidedly injurious; and will serve as a cloak under which ignorance and presumption may be advanced to situations where skill and caution are indispensable. This would be a deplorable result; and we are sorry to have to say that some of the very worst shipwrecks that have recently occurred have been occasioned by what would appear to be the gross incapacity of masters holding first-class certificates. This is a matter that requires to be carefully inquired into. Sham examinations are not a security against imposture, but a device to make confidence be given to those who are unworthy of any. The existing statutory regulations in regard to this important subject are embodied in the Mercantile Shipping Act of 1854, the 17 & 18 Vict. c. 104., and are as follows, viz.:—

Examinations to be instituted for Masters and Mates.—Examinations shall be instituted for persons who intend to become masters or mates of foreign-going ships, or of home trade passenger ships, or who wish to procure certificates of competency herein-after mentioned; and, subject as herein mentioned, the Local Marine Boards shall provide for the examinations at their respective ports, and may appoint and from time to time remove and re-appoint examiners to conduct the same, and may regulate the same; and any members of the Local Marine Board of the place where the examination is held may be present and assist at any such examination.—§ 131.

Powers of B. of Trade over Examinations.—The B. of Trade may from time to time lay down rules as to the conduct of such examinations and as to the qualifications of the applicants, and such rules shall be strictly adhered to by all examiners; and no examiner shall be appointed unless he possesses a certificate of qualification, to be from time to time granted or renewed by the B. of Trade; and the sanction of the B of Trade shall be necessary, so far as regards the number of examiners to be appointed, and the amount of their remuneration; and the B. of Trade may at any time depute any of its officers to be present and assist at any examination; and if it appear to the B. of Trade that the examinations for any two or more ports can be conducted without inconvenience by the same examiners, it may require and authorise the Local Marine Boards of such ports to act together as one board in providing for and regulating examinations and appointing and removing examiners for such ports.—§ 132.

Fees to be paid by Applicants for Examination.—All applicants for examination shall pay such fees, not exceeding the sums herein specified, as the B. of Trade directs; and such fees shall be paid to such persons as the said board appoints for that purpose.—§ 133.

	£	s.	d.
For a Certificate as Master	2	0	0
For a Certificate as Mate	1	0	0

Certificates of Competency to be granted to those who pass.—Subject to the proviso after contained, the B. of Trade shall deliver to every applicant who is duly reported by the local examiners to have passed the examination satisfactorily, and to have given satisfactory evidence of his sobriety, experience, ability, and general good conduct on board ship, a "certificate of competency" to the effect that he is competent to act as master, or as first, second, or only mate of a foreign-going ship, or as master or mate of a home trade passenger ship, as the case may be: provided that in every case in which the B. of Trade has reason to believe such report to have been unduly made, such board may remit the case

either to the same or to any other examiners, and may require a re-examination of the applicant, or a further inquiry into his testimonials and character, before granting him a certificate.—§ 134.

Certificates of Service to be delivered to Persons who served as Masters or Mates before 1851, &c.—Certificates of service, differing in form from certificates of competency, shall be granted as follows; (that is to say),

(1.) Every person who before the 1st day of January, 1851, served as master in the British merchant service, or who has attained or attains the rank of lieutenant, master, passed mate, or second master, or any higher rank in the service of H.M. or of the E. I. Company, shall be entitled to a certificate of service as master for foreign-going ships:

(2.) Every person who before the 1st day of January, 1851, served as mate in the British merchant service shall be entitled to a certificate of service as mate for foreign-going ships.

(3.) Every person who before the 1st day of January, 1854, has served as master of a home trade passenger ship, shall be entitled to a certificate of service as master for home trade passenger ships:

(4.) Every person who before the 1st day of January, 1854, has served as mate of a home trade passenger ship shall be entitled to a certificate of service as mate for home trade passenger ships:

And each of such certificates of service shall contain particulars of the name, place, and time of birth, and of the length and nature of the previous service of the person to whom the same is delivered; and the B. of Trade shall deliver such certificates of service to the various persons so respectively entitled thereto, upon their proving themselves to have attained such rank or to have served as aforesaid, and upon their giving a full and satisfactory account of the particulars aforesaid.—§ 135.

No foreign-going Ship or home trade Passenger Ship to proceed to Sea without Certificates of the Master and Mates.—No foreign-going ship or home trade passenger ship shall go to sea from any port in the U. K. unless the master thereof, and in the case of a foreign-going ship the first and second mates or only mate (as the case may be), and in the case of a home trade passenger ship the first or only mate (as the case may be), have obtained and possess valid certificates either of competency or service appropriate to their several stations in such ship, or of a higher grade; and no such ship, if of 100 tons burden or upwards, shall go to sea as aforesaid, unless at least one officer besides the master has obtained and possesses a valid certificate appropriate to the grade of only mate therein or to a higher grade; and every person who, having been engaged to serve as master or as first or second or only mate of any foreign-going ship, or as master or first or only mate of a home trade passenger ship, goes to sea as aforesaid as such master or mate without being at the time entitled to and possessed of such a certificate as herein required, or who employs any person as master, or first, second, or only mate of any foreign-going ship, or as master or first or only mate of a home trade passenger ship, without ascertaining that he is at the time entitled to and possessed of such certificate, shall for each such offence incur a penalty not exceeding 50*l.*—§ 136.

Certificates for Foreign-going Ships available for Home Trade Passenger Ships.—Every certificate of competency for a foreign-going ship shall be deemed to be of a higher grade than the corresponding certificate for a home trade passenger ship, and shall entitle the lawful holder thereof to go to sea in the corresponding grade in such last-mentioned ship; but no certificate for a home trade passenger ship shall entitle the holder to go to sea as master or mate of a foreign-going ship.—§ 137.

The Registrar to record Grants, Cancellations, &c. of Certificates.—All certificates, whether of competency or service, shall be made in duplicate, and one part shall be delivered to the person entitled to the certificate, and the other shall be kept and recorded by the Registrar General of seamen or by such other person as the B. of Trade appoints for that purpose; and the B. of Trade shall give to such registrar or such other person immediate notice of all orders made by it for cancelling, suspending, altering, or otherwise affecting any certificate in pursuance of the powers herein contained; and the registrar or such other person as aforesaid shall thereupon make a corresponding entry in the record of certificates; and a copy purporting to be certified by such registrar or his assistant or by such person as aforesaid of any certificate shall be *primâ facie* evidence of such certificate, and a copy purporting to be so certified as aforesaid of any entry made as aforesaid in respect of any certificate shall be *primâ facie* evidence of the truth of the matters stated in such entry.—§ 138.

In case of Loss a Copy to be granted.—Whenever any master or mate proves to the satisfaction of the B. of Trade that he has, without fault on his part, lost or been deprived of any certificate already granted to him, the B. of Trade shall, upon payment of such fee (if any) as it directs, cause a copy of the certificate to which by the record so kept as aforesaid he appears to be entitled, to be made out and certified as aforesaid, and to be delivered to him; and any copy which purports to be so made and certified as aforesaid shall have all the effect of the original.—§ 139.

Penalties for false Representations.—Every person who makes, or procures to be made, or assists in making, any false representation for the purpose of obtaining for himself or for any other person a certificate either of competency or service, or who forges, assists in forging, or procures to be forged, or fraudulently alters, assists in fraudulently altering, or procures to be fraudulently altered, any such certificate or any official copy of any such certificate, or who fraudulently makes use of any such certificate or any copy of any such certificate which is forged, altered, cancelled, suspended, or to which he is not justly entitled, or who fraudulently lends his certificate to or allows the same to be used by any other person, shall for each offence be deemed guilty of a misdemeanor.—§ 140.

The following clauses are from a subsequent part of the same statute.

Misconduct endangering Ship or Life or Limb a Misdemeanor.—Any master of or any seaman or apprentice belonging to any British ship who by wilful breach of duty, or by neglect of duty, or by reason of drunkenness, does any act tending to the immediate loss, destruction, or serious damage of such ship, or tending immediately to endanger the life or limb of any person belonging to or on board of such ship, or who by wilful breach of duty, or by neglect of duty, or by reason of drunkenness, refuses or omits to do any lawful act proper and requisite to be done by him for preserving such ship from immediate loss, destruction, or serious damage, or for preserving any person belonging to or on board of such ship from immediate danger to life or limb, shall for every such offence be deemed guilty of a misdemeanor.—§ 239.

Power of Admiralty Courts to remove Master.—Any court having admiralty jurisdiction in any of H. M.'s dominions may, upon application by the owner of any ship being within the jurisdiction of such court, or by the part owner or consignee, or by the agent of the owner, or by any certificated mate, or by one-third or more of the crew of such ship, and upon proof on oath to the satisfaction of such court that the removal of the master of such ship is necessary, remove him accordingly; and may also, with the consent of the owner or his agent, or the consignee of the ship, or if there is no owner or agent of the owner or consignee of the ship within the jurisdiction of the court, then without such consent, appoint a new master in his stead; and may also make such order, and may require such security in respect of costs in the matter, as it thinks fit.—§ 240.

Power to investigate Cases of alleged Incompetency and Misconduct.—If the B. of Trade or any Local Marine Board has reason to believe that any master or mate is from incompetency or misconduct unfit to discharge his duties, the B. of Trade may either institute an investigation or may direct the Local Marine Board at or nearest to the place at which it may be convenient for the parties and witnesses to attend to institute the same, and thereupon such persons as the B. of Trade may appoint for the purpose, or, as the case may be, the Local Marine Board, shall, with the assistance of a local stipendiary magistrate (if any), and if there is no such magistrate of a competent legal assistant to be appointed by the B. of Trade, conduct the investigation, and may summon the master or mate to appear, and shall give him full opportunity of making a defence either in person or otherwise, and shall for the purpose

of such investigation have all the powers given by the first part of this act to inspectors appointed by the B. of Trade, and may make such order with respect to the costs of such investigation as they may deem just; and shall on the conclusion of the investigation make a report upon the case to the B. of Trade; and in cases where there is no Local Marine Board before which the parties and witnesses can conveniently attend, or where such Local Marine Board is unwilling to institute the investigation, the B. of Trade may direct the same to be instituted before two justices or stipendiary magistrate; and thereupon such investigation shall be conducted, and the results thereof reported, in the same manner and with the same powers in and with which formal investigations into wrecks and casualties are directed to be conducted, and the results thereof reported, under the provisions contained in the eighth part of this act, save only that, if the B. of Trade so directs, the person bringing the charge of incompetency or misconduct to the notice of the B. of Trade shall be deemed to be the party having the conduct of the case.— § 241.

Board of Trade may cancel or suspend Certificates in certain Cases.—The B. of Trade may suspend or cancel the certificate (whether of competency or service) of any master or mate in the following cases; (that is to say,)

(1.) If upon any investigation made in pursuance of the last preceding section, he is reported to be incompetent, or to have been guilty of any gross act of misconduct, drunkenness, or tyranny.

(2.) If upon any investigation conducted under the provisions contained in the eighth part of this act, or upon any investigation made by a naval court constituted as herein-after mentioned, it is reported that the loss or abandonment of or serious damage to any ship or loss of life has been caused by his wrongful act or default.

(3.) If he is superseded by the order of any Admiralty Court or of any naval court constituted as herein-after mentioned.

(4.) If he is shown to have been convicted of any offence.

(5.) If upon any investigation made by any court or tribunal authorised or hereafter to be authorised by the legislative authority in any British possession to make inquiry into charges of incompetency or misconduct on the part of masters or mates of ships, or as to shipwrecks or other casualties affecting ships, a report is made by such court or tribunal to the effect that he has been guilty of any gross act of misconduct, drunkenness, or tyranny, or that the loss or abandonment of or serious damage to any ship, or loss of life has been caused by his wrongful act or default, and such report is confirmed by the governor or person administering the government of such possession.

And every master or mate whose certificate is cancelled or suspended shall deliver it to the B. of Trade or as it directs, and in default shall for each offence incur a penalty not exceeding 50*l.*; and the B. of Trade may at any subsequent time grant to any person whose certificate has been cancelled a new certificate of the same or of any lower grade.— § 242.

In 1855, the B. of Trade issued the following notice of the examinations under the Merchant Shipping Act; viz.

1. Under the provisions of the Merchant Shipping Act, 1854, no "foreign-going ship"* or "home trade passenger ship"* can obtain a clearance or transire, or legally proceed to sea, from any port in the U. K. unless the master thereof, and in the case of a foreign-going ship the first and second mates or only mate (as the case may be), and in the case of a "home trade passenger ship" the first or only mate (as the case may be), have obtained and possess valid certificates, either of competency or service, appropriate to their several station in such ship, or of a higher grade; and no such ship, if of one hundred tons burden or upwards, can legally proceed to sea unless at least one officer besides the master has obtained and possesses a valid certificate, appropriate to the grade of only mate therein, or to a higher grade; and every person who, having been engaged to serve as master, or as first or second or only mate of any "foreign-going ship," or as master or first or only mate of a "home trade passenger ship," goes to sea as such master or mate without being at the time entitled to and possessed of such a certificate as the Act requires, or who employs any person as master, or first, second, or only mate of any "foreign-going ship," or as master or first or only mate of any "home trade passenger ship," without ascertaining that he is at the time entitled to and possessed of such certificate, for each offence incurs a penalty not exceeding 50*l.*

2. Every certificate of competency for a "foreign-going ship" is to be deemed to be of a higher grade than the corresponding certificate for a "home trade passenger ship," and entitles the lawful holder to go to sea in the corresponding grade in such last-mentioned ship; but no certificate for a "home trade passenger ship entitles the holder to go to sea as master or mate of a "foreign-going ship."

3. A certificate of service entitles an officer, who had already served as either master or mate in a British foreign-going ship before the 1st of January, 1851, or as master or mate in a home trade passenger ship before the 1st January, 1854, to serve in those capacities again; and it also entitles an officer who has attained or attains the rank of lieutenant, master, passed mate, or second master, or any higher rank in the service of H. M. or of the E. I. Company, to serve as master of a British merchant ship, and may be had by application to the Registrar General of Seamen, Custom House, London, or to any shipping master in the outports, on the transmission and verification of the necessary certificates and testimonials.

4. Certificates of competency will be granted to those persons who pass the requisite examinations, and otherwise comply with the requisite conditions. For this purpose examiners have been appointed under the Local Marine Boards, and arrangements have been made for holding the examinations at the under-mentioned ports upon the days specified against them; and these days are so arranged for general convenience, that a candidate wishing to proceed to sea, and missing the day at his own port, may proceed to another port where an examination is coming forward. The days for commencing the examinations at the various ports are as follows:—

Places.	Days.
Aberdeen†	Fridays and Saturdays in the first and third week in each month.
Belfast	1st and 3rd Tuesday in each month.
Bristol†	1st Friday and 3rd Tuesday in each month.
Cork	4th Monday in each month.
Dublin	1st and 3rd Thursday in each month.
Dundee†	Saturday in each week.
Glasgow†	Thursdays, held alternately at each place.
Greenock†	
Hull†	2nd Tuesday in each month.
Leith†	2nd Tuesday and 3rd Saturday in each month.

* By a "foreign going ship" is meant one which is bound to some place out of the U. K. beyond the limits included between the river Elbe and Brest; and by a "home trade passenger ship" is meant any home trade ship employed in carrying passengers; and it is to be observed that foreign steam ships when employed in carrying passengers between places in the U. K. are subject to all the provisions of the Act, as regards certificates of masters and mates, to which British steam ships are subject (§ 291.).

† At these places extra examinations are held.

Places.	Days.
Liverpool†	Monday, Tuesday, Thursday, and Friday, in each week.
London†	Monday, Tuesday, and Wednesday, in Navigation; Thursday, Friday, and Saturday, in Seamanship.
Newcastle†	1st day of each month, not being Sunday.
Shields†	10th day of each month, ditto.
Sunderland†	20th day of each month, ditto.
Plymouth†	3rd Wednesday in each month.

5. Applicants for examination must give their names to the shipping master or to the Local Marine Board at the place where they intend to be examined, on or before the day of examination, and must conform to any regulations in this respect which may be laid down by the Local Marine Board; and if this be not done, delay may be occasioned.

6. Testimonials of character, and of sobriety, experience, ability, and good conduct on board ship, will be required of all applicants, and without producing them no person will be examined. As such testimonials may have to be forwarded to the office of the Registrar-General of Seamen in London for verification before any certificates can be granted, it is desirable that candidates should lodge them as early as possible. Upon application to the shipping master candidates will be supplied with a form, which they will be required to fill up and lodge with their testimonials in the hands of the examiners.

7. The examinations will commence early in the forenoon on the days before mentioned, and be continued from day to day until all the candidates whose names appear upon the shipping master's list on the day of examination are examined.

8. The qualifications required for the several ranks undermentioned, are as follows:—

QUALIFICATIONS FOR CERTIFICATES OF COMPETENCY FOR "FOREIGN GOING SHIP."

(*a*) A SECOND MATE must be seventeen years of age, and must have been four years at sea.

In Navigation.—He must write a legible hand, and understand the four first rules of arithmetic and the use of logarithms. He must be able to correct the courses steered for variation and leeway, and find the difference of latitude and longitude therefrom; be able to correct the sun's declination for longitude, and find his latitude by meridian altitude of the sun; and work such other easy problems of a like nature as may be put to him. He must understand the use of the sextant, and be able to observe with it, and read off the arc.

In Seamanship.—He must give satisfactory answers as to the rigging and unrigging of ships, stowing of holds, &c.; must

understand the measurement of the log-line, glass, and lead-line; be conversant with the rule of the road, as regards both steamers and sailing-vessels, and the lights carried by them.

(*b.*) An Only Mate must be eighteen years of age, and have been four years at sea.

In Navigation.—In addition to the qualification required for a second mate, an only *mate* must be able to work a day's work complete, including the bearings and distance of the port he is bound to by Mercator's method. He must be able to observe and calculate the amplitude of the sun, and deduce the variation of the compass therefrom. He must know how to lay off the place of the ship on the chart, both by bearings of known objects, and by latitude and longitude. He must be able to use a sextant and determine its error, and adjust it, and find the time of high water from the known time at full and change.

In Seamanship.—In addition to what is required for a second mate, he must know how to moor and unmoor, and to keep a clear anchor; to carry out an anchor, and stow a hold; and to make the requisite entries in the ship's log.

(*c.*) A First Mate must be nineteen years of age, and have served five years at sea, of which one year must have been as either second or only mate, or as both.*

In Navigation.—In addition to the qualification required for an only mate, he must be able to observe azimuths and compute the variation; to compare chronometers and keep their rates, and find the longitude by them from an observation by the sun; to work the latitude by single altitude of the sun off the meridian; and be able to use and adjust the sextant by the sun.

In Seamanship.—In addition to the qualification required for an only mate, a more extensive knowledge of seamanship will be required, as to shifting large spars and sails, managing a ship in stormy weather, taking in and making sail, shifting yards and masts, &c., and getting cargo in and out; getting heavy spars and weights, anchors, &c., in and out; casting a ship on a lee-shore; and securing the masts in the event of accident to the bowsprit.

(*d.*) A Master must be twenty-one years of age, and have been six years at sea, of which one year must have been as first or only mate, and one year as second mate; or two years as first and only mate.*

In addition to the qualification for a first mate he must be able to find the latitude by a star, &c. He will be asked questions as to the nature of the attraction of the ship's iron upon the compass, and as to the method of determining it. He must possess a sufficient knowledge of what he is required to do by law, as to entry and discharge, and the management of his crew; as to penalties and entries to be made in the official log. He will be questioned as to his knowledge of invoices, charter-party, Lloyd's agent, and as to the nature of bottomry, and he must be acquainted with the leading lights of the channel he has been accustomed to navigate, or which he is going to use.

In cases where an applicant for a certificate as master ordinary has only served in a fore and aft rigged vessel, and is ignorant of the management of a square rigged vessel, he may obtain a certificate on which the words "fore and aft rigged vessel" will be written. This is not, however, to apply to mates, who, being younger men, are expected for the future to learn their business completely.

(*e.*) An Extra Master's Examination is intended for such persons as wish to prove their superior qualifications. Before being examined for an extra master's certificate, an applicant must have served one year either as a master with an ordinary certificate of competency, or as a master having a first class certificate granted by one of the former Boards of Examiners.

In Navigation.—As the vessels which such masters will command frequently make long voyages, to the East Indies, the Pacific, &c., the candidate will be required to work a lunar observation by both sun and star, to determine the latitude by the moon and star, by Polar star off the meridian, and also by double altitude of the sun, and to verify the result by Sumner's method. He must be able to calculate the altitudes of the sun or star when they cannot be observed, for the purposes of lunars,—to find the error of a watch by the method of equal altitudes,—and to correct the altitudes observed with an artificial horizon.

He must understand how to observe and apply the deviation of the compass: and to deduce the set and rate of the current from the D. R. and observation. He will be required to explain the nature of great circle sailing, and know how to apply practically that knowledge; but he will not be required to go into the calculations. He must be acquainted with the law of storms, so far as to know how he may probably escape those tempests common to the East and West Indies, and known as hurricanes.

In Seamanship.—The extra examination will consist of an inquiry into the competency of the party to heave a ship down, in case of accident befalling her abroad; to get lower masts and other heavy weights in and out; how to construct rafts, and as to his resources for the preservation off the ship's crew in the event of wreck, and in such operations of a like nature as the examiner may consider necessary.

Qualifications for Certificates of Competency for "Home Trade Passenger Ships."

(*a.*) A Mate must write a legible hand, and understand the first four rules of arithmetic. He must know and understand the rule of the road, and describe and show that he understands the Admiralty regulations as to lights. He must be able to take a bearing by compass, and prick off the ship's course on a chart. He must know the marks in the lead line, and be able to work and heave the log.

(*b.*) A Master must have served one year as a mate in the foreign or home trade. In addition to the qualifications required for a mate, he must show that he is capable of navigating a ship along any coast, for which purpose he will be required to draw upon a chart produced by the examiner the courses and distances he would run along shore from headland to headland, and to give in writing the courses and distances corrected for variation, and the bearings of the headlands and lights, and when the courses should be altered either to clear any dangers or to adapt it to the coast. He must understand how to make his soundings according to the state of the tide.

* Service in a superior capacity is in all cases to be equivalent to service in an inferior capacity.

General Rules as to Examinations and Fees.

9. The candidates will be allowed to work out the various problems according to the method and the tables they have been accustomed to use, and will be allowed five hours to perform the work; at the expiration of which, if they have not finished, they will be declared to have failed, unless the Local Marine Board see fit to extend the time.

Fees to be paid by Applicants for Examination.

10. The fee for examination must be paid to the shipping master. If a candidate fail in his examination, half the fee he has paid will be returned to him by the shipping master on his producing a document which will be given him by the examiner. The fees are as follows:—

For "Foreign-going Ships."

	£	s.	d.
Second mate - - - -	1	0	0
First and only mate, if previously possessing an inferior certificate -	0	10	0
If not - - - -	1	0	0
Master, whether extra or ordinary -	2	0	0

For "Home Trade Passenger Ships."

Mate - - - - -	0	10	0
Master - - - - -	1	0	0

11. Any one who has been one year in possession of a master's first-class certificate granted by one of the former boards of examiners, or of an ordinary master's certificate of competency granted under the present examiners, may pass an extra examination, and receive an extra certificate in exchange for his former one, without payment of any fee; but if he fails in his first examination he must pay half a master's fee on his coming a second time; and the same sum for every subsequent attempt.

12. If the applicant passes he will receive a document from the examiner, which will entitle him to receive his certificate of competency from the shipping master at the port to which he has directed it to be forwarded. If his testimonials have been sent to the registrar to be verified, they will be returned with his certificate.

13. If an applicant is examined for a higher rank and fails, but passes an examination of a lower grade, he may receive a certificate accordingly, but no part of the fee will be returned.

14. In all cases of complete failure the candidate must be re-examined *de novo*, and in case of failure in seamanship a candidate will not be re-examined until after a lapse of six months, to give him time to gain experience.

15. As the examinations of masters and mates are made compulsory, the qualifications have been kept as low as possible; but it must be distinctly understood that it is the intention of the B. of Trade to raise the standard from time to time, whenever, as will no doubt be the case, the general attainments of officers in the merchant service shall render it possible to do so without inconvenience; and officers are strongly urged to employ their leisure hours, when in port, in the acquirement of the knowledge necessary to enable them to pass their examinations; and masters will do well to permit apprentices and junior officers to attend schools of instruction, and to afford them as much time for this purpose as possible.

Examinations in Steam.

16. Arrangements have been made for giving to those masters or first or only mates who possess certificates of competency, or who may apply for such certificates, and who desire it, an opportunity of undergoing an examination as to their practical knowledge of the use and working of the steam engine. These examinations will be conducted under the superintendence of the Local Marine Boards, at such times as they may appoint for the purpose; and the examiners will be selected by the B. of Trade, from the engineer surveyors appointed under the Act. The examination will not comprise intricate theoretical questions, but will be such as to satisfy the examiner that the applicant is competent to control the working of the engine, and has such a knowledge of the ordinary parts of the machinery as will enable him to judge of the nature of an accident, and, in the absence of the engineer, to give the necessary directions in the engine room. The practice will be as follows: The applicant must deliver to the shipping master a statement in writing to the effect that he wishes to be examined in steam. If he is about to pass an examination in navigation, the statement must be on or annexed to a form prepared for that purpose; if the applicant has a certificate of competency the statement must be delivered to the shipping master with his certificate, so that due notice may be given to the examiner, and so that the B. of Trade on receiving it may have the means of indorsing on his certificate and recording the fact that he has "Passed in Steam." He must also, at the same time, pay a fee of one pound (1*l.*), which will be applied in remunerating the examiners. Notice will be given of the time at which the applicant is to attend to be examined, and if he passes, the result of the examination will be reported to the B. of Trade, and his certificate of competency will be issued or returned to him, as the case may be, with an indorsement as above mentioned, showing that he has "Passed in Steam." If he fails, no notice of the failure will be recorded on the certificate, but no part of the fee will be returned.

17. Full directions as to the course of examination in steam and the qualifications required of candidates, are contained in the instructions issued to engineer surveyors appointed as examiners at the larger ports.

MASTICH, or MASTIC (Ger. *Mastix*; Du. *Mastik*; Fr. *Mastic*; It. *Mastice*; Sp. *Almastica, Almaciga*; Arab. *Arāh*). This resinous substance is the produce of the *Pistacia Lentiscus*, a native of the Levant, and particularly abundant in the island of

Chios. It is obtained by making transverse incisions in the trunks and branches of the trees, whence the mastic slowly exudes. About 1,500 cwt. are annually exported from Chios, part of which is brought to this country, packed in chests. The best is in the form of dry, brittle, yellowish, transparent tears; it is nearly inodorous, except when heated, and then it has an agreeable odour; chewed, it is almost insipid, feeling at first gritty, and ultimately soft; its virtues are trifling.—(*Ainslie's Materia Indica; Thomson's Dispensatory.*)

MATE, in a merchant ship, the deputy of the master, taking, in his absence, the command. There are sometimes only 1, and sometimes 2, 3, or 4 mates in a merchantman, according to her size; denominated 1st, 2nd, 3rd, &c. mates. The law, however, recognises only 2 descriptions of persons in a merchantman — the master and mariners; the mates being included in the latter, and the captain being responsible for their proceedings.

In men-of-war, the officers immediately subordinate to the captain are called lieutenants. But the *master*, or officer whose peculiar duty it is to take charge of the navigation of the ship, has certain mates under him selected from the midshipmen. The boatswain, gunner, carpenter, &c. have each their mates or deputies, taken from the crew.

The officers subordinate to the commander in the ships belonging to the East India Company were called 1st, 2nd, 3rd, &c. officers. East Indiamen had no sailing masters, the commanders performing that duty. —(*Falconer's Marine Dictionary, &c.*)

MATS (Du. *Matten;* Fr. *Nattes;* Ger. *Matten;* It. *Stuoje, Stuje;* Port. *Esteiras;* Rus. *Progoshki;* Sp. *Esteras*), textures composed, for the most part, of flags, reeds, the bark of trees, rushes, grass, rattans, old ropes, &c. In this country mats are used for a great variety of purposes. The coarser sort are very largely employed in the packing of furniture and goods; in the stowage of corn and various other articles on board ship; in horticultural operations; in covering the floors of churches and other public buildings, &c.: the finer sorts are principally employed in covering the floors of private houses.

In Europe, mats are principally manufactured for sale in Russia, where their production is a prominent branch of national industry. They consist of the bark of the lime or linden tree, and are known in this country by the name of *bast* mats. The Russian peasants manufacture this sort of material into shoes, cordage, sacks for corn, &c., and employ it in an endless variety of ways. In consequence of the vast quantities of matting that are thus made use of at home and sent abroad, the demand for it is immense. It is principally produced in the government of Viatka, Kostroma, and those immediately contiguous; and in the months of May and June, the period when the bark is most easily detached from the stem, the villages in the governments in question are almost deserted, the whole population being then in the woods employed in stripping the trees. The academician Köppen, who has carefully investigated this curious subject, estimates the average annual production of mats in European Russia, as follows: —

Government of Viatka	-	6,000,000 pieces
Ditto Kostroma	-	4,000,000 —
Ditto Kasan	-	1,000,000 —
Ditto Nijni Novgorod	-	1,000,000 —
Ditto Vologda, Tamboff, Simbirsk, and Penza	-	2,000,000 —
Total		14,000,000

Köppen further estimates that about 1-4th part of this vast quantity, or 3½ millions, are exported, the rest being consumed at home.

It is obvious from these statements that the annual destruction of linden trees must be quite enormous; and it may well excite astonishment that they are not already all but exhausted. But whether it be from the rapid growth of the tree, or the vast extent of the forests in which it is found, the gloomy forebodings of Mr. Tooke as to its destruction have not hitherto been realised (*View of Russia*, iii. 262.), and mats have not become either scarcer or dearer. It is, however, hardly possible to suppose, that such should continue to be the case, seeing the rapid increase of population and of the consumption of matting in most parts of the empire. But in the event of its becoming scarcer, the inhabitants will have no difficulty in finding substitutes; so that we agree in opinion with those who think it would be bad policy to impose any restrictions on this branch of industry, in the view of averting an evil which may never occur; and which, if it do occur, may be easily obviated. — (See a very interesting article in the *Supplement au Journal de l'Interieur de St. Petersburg*, for 1841, p. 113.)

Archangel is the principal port for the shipment of mats; and it appears that at an average of the years 1851 and 1852, the export of mats from that port amounted to

615,360 pieces a year. (See *antè*, art. ARCHANGEL.) Large quantities are also shipped from Petersburg, Riga, and other ports; and most descriptions of Russian produce sent abroad are packed in mats. The duty of 5 per cent. *ad valorem* formerly charged on mats has been repealed. Russian mats fetch, in the London market, about 3*l.* per 100.

Various descriptions of reed mats are extensively manufactured in Spain and Portugal; some of them being very beautifully varied. In Spain large quantities of matting are made of the Esparto rush. —(See ESPARTO.)

Rush floor mats, and rattan table mats of a very superior description are brought from China. They should be chosen clean, of a bright clear colour, and should, when packed, be thoroughly dry.

The mats of the Japanese are soft and elastic, serving them both for carpets and beds; they are made of a peculiar species of rush cultivated for the purpose.

The bags in which sugar is imported from the Mauritius consist of matting formed of the leaves of a tree growing in the island, interwoven in broad strips. They are very strong and durable, and may be washed and cleaned without sustaining any injury. Being imported in large quantities, they are sold very cheap. — Besides the works already referred to, see *Milburn's Oriental Commerce*, and the valuable little work entitled *Vegetable Substances, Materials of Manufactures*, published by the Society for the Diffusion of Useful Knowledge, pp. 116—123.)

It is probable that mats formed the first sort of wove fabrics produced by man; and it is worthy of remark that but few savage tribes have been discovered which have not attained to considerable eminence in their manufacture. On the coast of Guinea and other places in the west of Africa, pieces of fine mat, about a yard long, and of a pretty uniform texture, were denominated *makkutes*, and formed a sort of money; the value of commodities being rated and estimated in them. —(*Morellet, Prospectus d'un Dictionnaire de Commerce*, p. 122.) They enjoyed this distinction, no doubt, from their utility, and the great care and labour bestowed on their preparation. There is hardly an island in the South Seas in which the natives have not acquired great skill and dexterity in the making of mats. The finer sorts consist, generally, of dyed reeds or grass; and have a very brilliant appearance.

MAULMAIN, OR MOULMEIN, a sea-port town of India beyond the Ganges, cap. British prov. Martaban, at the mouth of the great river Than-lueng, having N. the Burmese town of Martaban, on the opposite side of the river, and W. the island of Balu, which serves as a natural breakwater to defend the port from the heavy seas that would otherwise be thrown in from the W., 100 m. S. S. E. Rangoon, 27 m. N. N. E. Amherst; lat. 16° 30′ N., long. 97° 38′ E. It was founded in 1825, when the site was selected by Sir A. Campbell as eligible as well for a commercial as a military station. It is about 200 feet above the level of the river, and extensive and fertile plains stretch eastward from it towards the mountains. Its port is good, and, from its extensive command of internal navigation, it promises to become a considerable emporium. The principal articles of export are teak timber and rice; but there is also a considerable export of tobacco, stick-lac, betel-nut, ivory, cutch, cocoa-nut, &c. The imports consist principally of European cotton goods and marine stores. The principal trade of the place has hitherto been carried on with Calcutta, Madras, Rangoon, and Pinang; but, in 1837, a direct trade was commenced with London. Owing to the facility with which supplies of teak timber are obtained, ship-building is carried on very extensively.

The population in 1848 was estimated at about 35,000. An English newspaper, (the *Maulmain Free Press*) from which we borrow the following statements, is published once a week.

Imports, 1847.		Exports, 1847.	
European goods	139,298 8 0	European goods	120,785 0 0
Indian ditto	59,199 3 6	Indian ditto	100,254 2 5
China ditto	71,745 0 0	China ditto	40,424 0 0
Burmese ditto	132,010 0 0	Burmese ditto	3,270 0 0
Rice and paddy	350 0 0	Rice and paddy	101,465 2 9
Miscellaneous	304,997 10 0	Timber	881,917 14 0
		Miscellaneous	144,642 12 0
Co.'s Rs.	707,598 6 0	Co.'s Rs.	1,392,755 14 5

"The principal article of commerce at Maulmain is teak timber, with which from 25 to 30 ships annually load for England. The quantity of teak exported to that country from 1840 to 1847, and its estimated official value, was as follows: —

Years.	No. of Tons.	Price per Ton.	Value.	Years.	No. of Tons.	Price per Ton.	Value.
		Rs.	£			Rs.	£
1840	4,952	25	12,380	1844	14,245	30	42,375
1841	6,399	25	15,988	1845	13,360	40	53,442
1842	11,847	25	28,717	1846	16,798	45	75,592
1843	10,528	30	31,584	1847	7,873	50	39,365

"Maulmain is a free port, on the same footing as Singapore, &c. There is no custom-house and no duties on seaborne goods; but foreign sugar, and sugar from Singapore and Malacca, is contraband.

"The coins in use are the Company's rupee and its subdivisions, the same as current in Calcutta. The English sovereign is generally worth 11 rupees, and the Spanish dollar 220 rupees per 100 dolls.

"The weights are the Madras viss equal to 3·065 lbs. avoirdupois, or say 3¾ lbs.; in this there are 100 ticuls. The Bengal bazaar maund of 82 lbs. is also occasionally used.

"The measures principally used are called baskets; they are of uncertain size. A basket of cleaned rice is about 65 lbs. in weight; of mixed, about 60 lbs.; paddy, 51 lbs.

"Ship-building is well adapted to the place, and some of the finest teak ships in the world have been built here. There are several dry docks, though not of a very efficient description, for repairing vessels. Her Majesty's government bought here, during 1847, upwards of 5,000 tons of teak for the royal dockyards in England."

The *Maulmain Almanac* for 1852 contains the following statements: — "The value of the imports by sea into Maulmain during 1850 amounted to Rps. 22,57,983, and the exports to Rps. 23,32,951; while in the first ten months of 1851 the imports increased in value to Rps. 28,78,487, or 287,848*l.*, and the exports to Rps. 28,79,797 or 287,979*l.* The town, which 20 years back contained only a 'few miserable fishing-huts,' is thus shown to have a trade of nearly 600,000*l.* a-year, which is still increasing. The value of the piece goods imported from Europe during 1851, amounted to 63,229*l.*; coals, 5,408*l.*; and iron, 1,849*l.* Provisions were imported to the extent of 3,496*l.*, and wines of the value of 492*l.*, military stores, 1,853*l.*, &c. The articles of export present no remarkable feature of interest except timber, the value of which in 1850 was 55,108*l.*, and in the first ten months of 1851, 81,561*l.* The town possesses a large and thriving European population, and 40 vessels, of an aggregate burden of 17,170 tons, have been launched from its dockyard since 1830. It contains three printing presses, seven places of public worship (five of which are Protestant), besides eight schools (English and native.)"

MAURITIUS. See PORT LOUIS.

MEAD, OR METHEGLIN (Ger. *Meht, Meth;* Du. *Meede, Meedrank;* Fr. *Hydromel;* It. *Idromele;* Rus. *Lipez*), the ancient, and for a long time, the favourite drink of the northern nations. It is a preparation of honey and water. Manufacturers of mead for sale must take out an annual licence.

MEAL (Ger. *Mehl;* Du. *Meel;* Fr. and It. *Farine;* Sp. *Farina;* Rus. *Muka;* Lat. *Farina*), the edible part of wheat, oats, rye, barley, and pulse of different kinds, ground into a species of coarse flour.

MEDALS, are pieces of metal, generally in the form of a coin, and impressed with some peculiar stamp, intended to commemorate some individual or action. Medals are of very different prices — varying according to their rarity and preservation, the fineness of the metal, the beauty of the workmanship, &c.

MEDITERRANEAN PASS. The nature of this sort of instrument has been described by Mr. Reeves, in his *Treatise on the Law of Shipping*, as follows: —

"In the treaties that have been made with the Barbary states, it has been agreed, that the subjects of the King of Great Britain should pass the seas unmolested by the cruisers of those states; and for better ascertaining what ships and vessels belong to British subjects, it is provided that they shall produce *a pass* under the hand and seal of the Lord High Admiral, or the Lords Commissioners of the Admiralty. In pursuance of these treaties, passes are made out at the Admiralty, containing a very few words, written on parchment, with ornaments at the top, through which a scolloped indenture is made; the *scolloped tops* are sent to Barbary; and being put in possession of their cruisers, the commanders are instructed to suffer all persons to pass who have passes that will fit these scolloped tops. The protection afforded by these passes is such, that no ships, which traverse the seas frequented by these rovers, ever fail to furnish themselves with them, whether in the trade to the East Indies, the Levant, Spain, Italy, or any part of the Mediterranean; and from the more particular need of them in the latter, they, no doubt, obtained the name of *Mediterranean passes*. For the accommodation of merchants in distant parts, blank passes, signed by the Lords of the Admiralty, are lodged with the governors abroad, and with the British consuls, to be granted to those who comply with the requisites necessary for obtaining them. As this piece of security is derived wholly from the stipulations made by the crown with a foreign power, the entire regulation and management of it has been under the direction of his Majesty, who, with the advice of the privy council, has prescribed the terms and conditions on which these passes shall be granted. Among others are the following: — They are to be granted for none but British-built ships, or ships made free, navigated with a master and ⅔ths of the mariners British subjects, or foreign protestants made denizens. Bond is to be given in the sum of 300*l.* if the vessel is under 100 tons, and in 500*l.* if it is of that or more, for delivering up the pass within 12 months, unless in the case of ships trading from one foreign port to another; and such passes need not be returned in less than 3 years.

"It has been found expedient, at the conclusion of a war, and sometimes during a peace, to recal and cancel all passes that have been issued, and to issue others in a new form. This has been done for 2 reasons. 1st. That these useful instruments, by various means, either accidental or fraudulent, came into the hands of foreigners, who, under cover of them, carried on in security a trade which otherwise would belong to British subjects, and which had been purchased by the crown, at the expense of keeping up this sort of alliance. 2dly, That the Barbary states complained, that, adhering to the rule of fitting the other part of the indenture to the passes, they were obliged to suffer ships to pass that did not belong to British subjects."

We have thought it right to give this explanation, though, since the occupation of Algiers by the French, and the disappearance of the corsairs of the other Barbary powers, Mediterranean passes have fallen into disuse.

MEMEL, a commercial town of East Prussia, lat. of light-house 55° 43′ 7″ N.,

lon. 21° 6′ 2″ E. Population, in 1846, 9,400. Memel is situated on the north-east side of the great bay, denominated the *Currische Haf*, near its junction with the Baltic. It is, consequently, the principal *entrepôt* of the country traversed by the Niemen, and as such enjoys a pretty extensive commerce.

Harbour.— The harbour of Memel is large and safe; but the bar at the mouth of the Currische Haf has seldom more than 17 feet water, and sometimes not more than 13 or 14 feet; so that ships drawing more than 16 feet water are frequently obliged to load and unload a part of their cargoes in the roads, where the anchorage is but indifferent, particularly when the wind is N. or N. W. A lighthouse, originally 75, but now 100 feet in height, has been erected on the N. E. side of the entrance to the harbour. The light, which is fixed and powerful, may be distinguished in clear weather at more than 20 miles' distance. The outer buoy lies in 6 fathoms water, about a mile without the lighthouse, which bears from it S. E. by E. ½ E. The channel thence to the harbour is marked by white buoys on the north, and red on the south side. Three beacons to the north of the town, when brought into a line, lead directly into the harbour. Inasmuch, however, as the channel is subject to frequent changes, both in depth and direction, it is always prudent, on arriving at the outer buoy, to heave to for a pilot; but this is not obligatory; and the Prussian authorities have issued directions for ships entering without a pilot, which may be found in Norie's *Sailing Directions for the Cattegat and Baltic*, p. 36.

Trade.—Timber forms the principal article of export; for though that of Dantzic be considered better it is generally cheaper, and almost always more abundant, at Memel. Here, as at Dantzic, the best quality of all sorts of wood articles is called *khron*, or crown, the 2nd *brack*, and the 3rd *bracks brack*. Large quantities of hemp and flax are also exported, as are bristles, hides, linseed (the finest for crushing brought to England), wax, pitch, and tar, &c. The exports of grain, especially rye, are sometimes very considerable. The wheat of Lithuania is reckoned the best. All flax and hemp shipped from Memel must be *bracked*, or assorted by sworn selectors.—(See FLAX and HEMP.) The imports consist principally of salt, herrings, coffee, sugar, spices, dye-woods, tobacco, tea, iron, cotton stuffs and yarn, cutlery, wine, &c. Merchants at Memel generally send their bills to Königsberg to be sold, charging their correspondents with 1 per cent. for bank commission, postages, &c. The navigation generally closes about the latter end of December, and opens about the middle of March.

MERCURY, OR QUICKSILVER (Fr. *Vif argent*; Ger. *Quicksilber*; It. *Argento vivo*; Sp. *Azogue*; Russ. *Rtut*; Lat. *Hydrargyrum*; Arab. *Zibākh*; Hind. *Parah*; Sans. *Pārada*.) This metal was known in the remotest ages, and seems to have been employed by the ancients in gilding, and separating gold from other bodies, just as it is by the moderns. Its colour is white, and similar to that of silver; hence the names of *hydrargyrum*, *argentum vivum*, *quicksilver*, by which it has been known in all ages. It has no taste or smell. It possesses a good deal of brilliancy; and when its surface is not tarnished, it makes a very good mirror. Specific gravity 13·568. It differs from all other metals in being always fluid, unless when subjected to a degree of cold equal to —39°, when it becomes solid. The congelation of mercury was first observed in 1759. — (*Thomson's Chemistry.*)

Mercury is found in various parts of the world. Among the principal mines are those of Almaden, near Cordova, in Spain; Idria, in Carniola; Wolfstein and Morsfield, in the Palatinate; Guancuaelica, in Peru, &c. "Most of the ores of mercury are readily distinguished from those of any other metal; in the 1st variety, globules of the metal are seen attached to or just starting on the surface, which is at once a sufficient criterion, mercury being unlike every other metal; in the 2nd, by the fine white colour, and the action of the blowpipe, which sublimes the mercury and leaves the silver behind; the 3rd, by its beautiful deep red tint, varying from cochineal to scarlet red, excepting in those termed hepatic cinnabars, which are generally of a lead grey; the 4th, by its grey colour, its partial solubility in water, and its complete volatilisation by heat, emitting at the same time an arsenical odour. Before the blowpipe, these varieties burn with a blue flame and sulphurous odour, leaving more or less residue behind them, and which may consist of earthy matter, as silex and alumina, together with the oxides of iron and copper."—(*Joyce's Chem. Min.*)

Mercury is often adulterated by the admixture of lead, bismuth, zinc, and tin. When the metal quickly loses its lustre, is covered with a film, or is less fluid and mobile than usual, or does not readily divide into round globules, there is reason to suspect its purity.

Our supplies of mercury are derived almost wholly from Spain. The imports usually amount to from 2,000,000 to 3,000,000 lbs., of which about 300,000 lbs. are retained for home consumption, the surplus being exported to S. America, France, the E. Indies, &c.

The exports of quicksilver from Spain in 1848 amounted to 48,868 quintals, of which nearly 40,000 quintals were furnished by the mines of Almaden. The province of Idria, in Austria, has also some rather productive quicksilver mines. And the produce of this metal in California, and other parts of S. America, is said to be already considerable, and to be increasing.

There are 2 sulphurets of mercury; the black or *ethiops mineral*, and the red or *cinnabar*. When mercury and sulphur are triturated together in a mortar, the former gradually disappears, and the whole assumes the form of a black powder, denominated ethiops mineral. If this powder be heated red-hot, it sublimes; and on a proper vessel being placed to receive it, a cake is obtained, of a fine red colour, which is called cinnabar. This cake, when reduced to powder, is well known in commerce by the name of *vermilion*. Cinnabar may be prepared in various other ways.

Calomel, or protochloride of mercury (*mercurius dulcis*) is the most useful of all the preparations obtained from it. It is in the form of a dull white, semi-transparent mass, having a specific gravity of 7·176. It is more generally employed, and with better effect, than almost any other remedy in the whole range of the materia medica.

Besides its uses in medicine, mercury is extensively employed in the amalgamation of the noble metals, in water-gilding, the making of vermilion, the silvering of looking-glasses, the making of barometers and thermometers, &c.

METALS (Lat. *Metalla*; Fr. *Métaux*), solid *, opaque, heavy bodies, which melt at various degrees of temperature, and recover their previous solidity when it is reduced; when cut or fractured they exhibit a brilliant or lustrous appearance, and possess more or less malleability, tenacity, and so forth. The really valuable metals, comprising gold, silver, quicksilver, copper, lead, iron, and tin, were all known to the ancients, and were as much esteemed by them as by the moderns. They are sometimes

* With the single exception of quicksilver, which is fluid, and used, on that account, to be called semi-metal.

found native, but far more generally in the shape of ores intermixed with other bodies. And their separation from the latter, and manufacture into useful and ornamental articles, is one of the greatest achievements of human industry, and has contributed more, perhaps, than anything else to accelerate the progress of civilisation. At this moment the smelting, refining, and working of metals forms one of the most important, if it be not the most important, industrial pursuit carried on in this country. The reader will find notices of the most important metals under their respective names. And we only notice them here that we may insert the following statements, viz., an estimate of the value of the metals produced in the U. Kingdom in 1857, as they came from the furnace, and an account of the quantities and values of the metals exported in each of the three years ending with 1857.

The estimate of their value in a crude state is

Tin	£ 867,680	Zinc	£ 450,000
Copper	2,166,900	Pig iron	12,838,560
Lead	1,523,852	Other metals	125,500
Silver	133,216		£ 18,105,708

This estimate was framed by Mr. Robert Hunt of the Mining Record Office, and may, we believe, be safely depended upon.

Account of the Quantities and Values of the Metals exported from the U. K., being the Produce of the same, during each of the 3 Years ending with 1857.

Metals.		Quantities.			Declared Values.		
		1855.	1856.	1857.	1855.	1856.	1857.

MILE, the usual measure of roads in England, being 8 furlongs, or 1,760 yards.

MILK (Fr. *Lait;* It. *Latte;* Lat. *Lac*), a fluid secreted by the female of all those animals denominated *mammalia*, and evidently intended for the nourishment of her offspring. The milk of every animal has certain peculiarities which distinguish it from all other milk. But the animal whose milk is most used by man, and with which, consequently, we are best acquainted, is the cow. The external character of all milk is that of a white opaque fluid, having a sweetish taste, and a specific gravity somewhat greater than that of water. When allowed to remain at rest, it separates into 2 parts; a thick whitish fluid called *cream*, collecting in a thin stratum over its surface, and a more dense watery body, remaining below. Milk which has stood for some time after the separation of the cream, becomes acescent, and then coagulates. When the coagulum is pressed gently, a serous fluid is forced out, and there remains the caseous part of the milk, or pure cheese.

Butter, one of the most valuable animal products, is solidified cream, and is obtained artificially by churning.—(See BUTTER.)

Milk has always been a favourite food of most European nations, and especially of the British. *Lacte et carne vivunt*, says Cæsar of our ancestors; and the same articles still continue to form a large part of our subsistence. Mr. Middleton estimated (*Agricultural Survey of Middlesex*, 2d ed. p. 419.), that, in 1806, no fewer than 8,500 milch cows were kept for the supply of London and its environs with milk and cream; and he estimated the average quantity of milk obtained from each cow at *nine quarts* a day, or 3,285 quarts a year, leaving, every deduction being taken into account, 3,200 quarts of marketable produce.

But Mr. Youatt, in his valuable work on cattle, their breeds, &c., estimated the number of dairy cows kept in 1843, in London and its environs, at 12,000; affording, on Mr. Middleton's hypothesis, an annual supply of 38,400,000 quarts of milk. Now, as milk is sold by the retailers at from 3*d.* to 4*d.* a quart after the cream is separated from it, and as the cream is usually sold at from 2*s.* 6*d.* to 3*s.* a quart, and there is reason to suspect that a good deal of water is intermixed with the milk, we believe we should hardly be warranted in estimating that the milk, as obtained from the cow, is sold at less than 5*d.* a quart, which gives 800,000*l.* as the total price of the milk consumed in the city and its immediate vicinity. If to this sum were added the further sums paid for cheese and butter, the magnitude of the entire sum paid in the metropolis for milk, and the various products derived from it, would appear not a little astonishing.

MILLET (Ger. *Hirse;* Fr. *Millet, Mil;* It. *Miglio, Panicastrello;* Sp. *Mijo;* Lat. *Milium, Panicum miliaceum.*) There are 3 distinct species of millet; the Polish millet, the common or German millet, and the Indian millet. It is cultivated as a species of grain; and is sometimes employed to feed poultry, and as a substitute for rice. The Indian millet grows to a large size; but the autumns in England are seldom dry and warm enough to allow of its being cultivated here. — (*Loudon's Encyc. of Agriculture.*)

MILL-STONES (Ger. *Mühlsteine;* Fr. *Pierres meulières;* It. *Mole macine;* Sp. *Muelas de Molino;* Rus. *Schernowoi kamen,*) the large circular stones, which, when put in motion by machinery, grind corn and other articles. The diameter of common mill-stones is from 5 to 7 feet, and their thickness varies from 12 to 18 inches. These stones have been principally imported from Rouen and other parts of France; the burr-stones of that country being supposed to be more durable than our own. Mill-stones are, however, found at Conway, in North Wales, and in some parts of Scotland, which have been said, though on no very good authority, to be equal to those imported.

The island of Milo, in the Archipelago, furnishes mill-stones of a very excellent quality. They are exported to Greece, Italy, and other countries on the Mediterranean, where they are employed in grinding the hard wheat, or *grano duro*, used in the manufacture of macaroni, vermicelli, &c. The quarries are wrought on account of government, and the stones sold at moderate prices fixed by a tariff, which, however, leave a handsome profit to the state. (*Tournefort, Voyage au Levant*, letter iv.; *Strong's Greece*, p. 222.)

Whether it were owing, as was generally supposed, to the inferiority of the stones, or to some other cause, there can be no doubt of the fact that down to a late period our flour mills were less efficient than those of France and some other countries; and hence, in part at least, the late very large importations of French flour. But this inferiority is now all but wholly obviated. The English mills produce flour of a superior quality; and hard, as well as soft, wheat is readily bought by our millers. The duties on mill and other stones have been repealed.

MINING COMPANIES. By this designation was formerly meant the associations formed in London, in 1825, for working mines in Mexico and S. America; but at present it comprises all mining projects carried on by joint-stock associations.

The *mania* for mining concerns, which raged in London and the empire generally in 1824 and 1825, after the opening of Mexico and other parts of Spanish America to our intercourse, forms a remarkable, and we are sorry to add, disgraceful æra in our commercial history. Now that the delusion is long past, we have difficulty in conceiving how mercantile men could be led to entertain such visionary expectations, and to pay immense premiums for shares in distant and hazardous undertakings of which they knew little or nothing. We may, therefore, be excused for appropriating a page or two to the notice of an infatuation hardly second to that which led to the South Sea and Mississippi schemes.

The American mining companies formed at the outset had some sort of basis for favourable expectations, their directors having made contracts for a number of mines in Mexico, described by Humboldt as having enriched many families. This particularly applies to the Real del Monte Company, whose mines are situated in the mountainous district of that name; to the Anglo-Mexican Company, whose mines are at Guanaxuato, the principal mining quarter in Mexico; and to the United Mexican Company, whose contracts, though too widely spread, comprise several valuable mines at Zacatecas, Sombrerete, Guanaxuato, and other parts.

These associations were formed in London early in 1824, and during the spring and summer of that year their stock or shares bore only a small premium; but towards the winter it began progressively to rise; not because of any favourable intelligence from the mines (for the accounts from Mexico merely reported the arrival of the English

agents), but from a blind ardour and spirit of speculation in the public, which really took *omne ignotum pro magnifico*, every rumour of a mine for a certain and exhaustible source of profit and of wealth! It was supposed that our countrymen were about to reap an immediate harvest; to lay their hands on a treasure hid for ages. This was said to be the true discovery of America, the effectual access to her resources. Every new contract for a Mexican mine produced a rise in the shares of the other companies, as if the fresh undertaking must necessarily be a source of profit to the whole! And the result was, that in January, 1825, the premium on the shares of most of the companies exceeded cent. per cent.! It must not, however, be imagined that this rise of price was occasioned solely by the competition of individuals who intended to continue to hold stock and to trust to the dividends made by the companies for a return. That this was the case in the first instance, is, speaking generally, true. But a host of others, actuated by very different views, speedily entered the field. A peculiar combination of circumstances, at the head of which must be placed an almost incredible degree of ignorance and folly on the part of a considerable portion of the public, spread a spirit of gambling among all classes. Many who were most eager in the pursuit of shares, intended only to hold them for a few hours, days, or weeks, to profit by the rise which they anticipated would take place by selling them to others more credulous or bold than themselves. The confidence of one set of speculators confirmed that of others. Meanwhile the public gullibility, or rather its indiscriminating rapacity, was liberally administered to. Company after company was formed without any previous contract; in other words, without any foundation whatever! The plan was to fix on a district in America, understood to contain mines; to form a company bearing the name of such district; to obtain a first payment from the shareholders, and to send or pretend to send out agents, to survey the district and engage mines. Such was the case of most of those companies having the names of districts in South America; and such, also, was the case of the Hispaniola or St. Domingo Company, formed on the basis of accounts given by Robertson of mines wrought in that island some 3 centuries ago! And yet lawyers, clergymen, and even the nobles of the land, were candidates for shares in these miserable bubbles, in the hope of finding (in which, luckily, most of them were disappointed) some dupe to buy their shares at a premium.*

As the year 1825 proceeded, the mining mania gradually declined, not from any falling off in the prospects of the companies, for in truth they never had any, but in the supply of money in London. That redundancy of the currency in which the mining mania had partly originated, having brought about an adverse exchange, and a heavy drain for bullion on the Bank of England, the latter was obliged to pull up, and in a moment the bubble burst, and unreasonable suspicion took the place of blind unthinking confidence. Mining projects, from being in the highest favour, fell to the lowest point in the public estimation. The shares of the 3 principal companies, some of which had been at a premium of 500 per cent., fell to par: that is 100*l.* in money, and no more, could be got for 100*l.* of the company's stock! They maintained this price for a considerable time, because most of the parties interested continued to have a favourable impression of the undertakings. Demands, however, continued to be made for additional sums to meet the expenditure abroad; and in 1826 and 1827 mining shares progressively declined, so that 100*l.* stock fetched only 20*l.* or 25*l.* in money. The bubble companies were entirely destroyed, and the few only remained that were founded by capitalists and had some foundation to stand upon.

Even these would have been relinquished, or have shrunk into very small dimensions, had not the directors been able to enforce further payments, by forfeiting, in default of such, whatever had been previously paid by the subscribers. The usage was, that on becoming a shareholder each person subscribed the deed of the company, engaging to pay, when called on, such instalments or sums to account (generally 10*l.* on each share) as should be required by the directors, until he had completed payment of the 100*l.* And many shareholders who had advanced 50*l.* or 60*l.* unwisely preferred paying 10*l.* from time to time, rather than incur the immediate forfeiture of all they had paid. Those who held only a few shares felt this in a less degree; but to the holders of a number of shares, the grievance was most serious. Numbers of them raised the money with great difficulty; often selling, at a heavy loss, their family property, or prevailing on relations to make them advances, to their great inconvenience, and, as far as can be seen, with almost no prospect of a return. Resentment would be excited against the

* Those who may be desirous of seeing the extent to which the public credulity was practised upon in 1824 and 1825, may consult a pamphlet published by H. English, broker, in 1827, which contains an account of all the joint-stock companies formed and projected in these memorable years. It presents a most extraordinary picture. There were in all 74 mining companies formed and projected. The number and quality of the other schemes were similar. It is due to Mr. Baring (the late Lord Ashburton) to say that he denounced the evil when in progress; and warned the unthinking multitude of the ruin they were bringing upon themselves; but to no purpose.

directors, had they not been, in general, the heaviest sufferers: their regulations required them to hold a certain number of shares (perhaps 20 or 30); but in their blind confidence they frequently held 200 or 300, and drew on themselves a proportional sacrifice — in several cases, the loss of their whole property.

The managers of the companies formed in the outset were principally chargeable with ignorance, rashness, and overweening confidence. They had, in fact, but little information to go upon. The monopoly enforced by Old Spain had prevented any considerable communication between this country and her colonies. And of the Spaniards settled in Mexico, and driven from it by the civil wars and consequent emancipation of the country, few or none found their way hither, the great majority having repaired to Cuba, the south of France, and Spain. Nor were the published accounts of the country entitled to much confidence: Humboldt's Travels formed the chief authority, but their illustrious author, though generally cautious, seems, in this instance, to have placed too much confidence in vague, exaggerated statements. Our merchants knew, generally, that silver mines formed a main branch of the productive industry of Mexico, and had enriched very many families originally in humble circumstances; but they had no idea of the injury sustained by the mines during the civil war, nor of the amount of expenditure required to bring them into a working state: nor were they aware how little useful information could be expected from the natives; the working of the mines, like every operation requiring skill and intelligence, having been superintended by natives of Old Spain, who had either fallen in the civil war, or been expelled after the Mexicans succeeded in the contest. Hence, the agents of our companies found on the spot only native Mexicans, without education or experience in business, and, speaking generally, without candour or probity. They urged our countrymen to drain the mines, not by machinery, of which they had no idea, but by animal power, the use of which was of advantage to them, by employing their horses, and creating a great consumption of maize, the principal grain of the country. Then, as to the last and most important stage in the business of mining, — the mode of extracting the silver from the ore, — the Mexicans, wholly unacquainted with the improvements made in Germany during the last half century, recommended amalgamation, a process conducted by them in a very rude manner, and which, in most qualities of silver ore, fails to extract the whole, or anything like the whole, of the metal. The object of the Mexicans, in short, was merely to make English capital be circulated among them; thus giving employment to their people for a time, and bringing the mines into an improved state; when they (the Mexicans) might hope to resume them after our countrymen had exhausted their resources, or had become weary of their contracts.

The expense of conveying the requisite machinery from the coast of Mexico to the mining districts, generally at a great distance in the interior, absorbed much capital. The country has few practicable roads, and these have latterly been allowed to fall into disrepair; draught carriages are almost unknown, and burdens are carried on the backs of mules and horses: add to this, that Mexico being under-peopled, labour is nearly as high in it as in the United States of North America; and the mechanical arts being in a manner unknown, all skilled workmen, such as carpenters, blacksmiths, and working engineers, had to be sent from England at a heavy expense. (For an account of the low state of the arts in Mexico, see the extracts from Chevalier's Letters in the *Geog. Dict.* art. MEXICO.)

Such were the chief causes of the failure of the Mexican mining companies; and several of these may be referred to one radical disadvantage — the non-existence of silver mines in England. We have, in Cornwall, considerable mines of tin and copper, while in the northern counties we have mines of lead; but of silver we have none that deserve the name. How much better had it been had our countrymen set out with a consciousness that Germany is the only country in which the treatment of silver ore is conducted on scientific principles! The Saxons extract a profit from ore of very inferior quality, often worth only a fourth or fifth part of the ore raised by the Mexicans on account of our companies, but which, being wrought by their crude, inefficient, and expensive process, fails to afford anything like a satisfactory return. There seems no reason to doubt that the German process may be applied to silver ore in Mexico as in Europe: the difficulties arise, not from difference in the quality of the ore, but from the want of experienced smelters, and the general backwardness of the Mexicans in mechanics.

But though the companies had been in all other respects successful, they had a serious drawback to contend with in the unsettled state of the country. No government has as yet been established in Mexico, nor in any other of the newly constituted American states, with power, or perhaps inclination, sufficient to put down disturbances, or to enforce the observance of contracts. So long as the companies were struggling to put their mines into order, they sustained little inconvenience from the circumstances now mentioned; but the moment they had succeeded in bringing them once more into a productive state, and were beginning to have a reasonable prospect of obtaining some return for their enormous outlays, they were annoyed by questions as to title, and by the setting up of claims on the mines, of which they had never heard before. In some instances the claimants had recourse to violence, and the companies' servants were forcibly ejected from their works! Chevalier says that it required an armed force to transport any quantity of ore from the mine to the place of its destination; and he gives an account of a murderous attack made in 1835 on some miners belonging to the Real del Monte company.—(See *Geog. Dict.* art. MEXICO.) Probably, however, there has latterly been, in this respect, some improvement. At all events, the produce of the mines is increasing in Mexico and most parts of South America.—(See art. PRECIOUS METALS.)

Without, however, pretending to anticipate the final result of these remote speculations, we shall conclude with a brief notice of the considerations on both sides of the question. The circumstances adverse

to the success of mining companies in America, conducted on account of parties in England or in any part of Europe, are —

1. The various disadvantages of distant management. These are so many and so serious, as to admit of only one corrective, — selling the ore as soon as raised, and transferring to individuals, for their own account, the extraction of the metal, as is done in Cornwall, and, in a somewhat different manner, in Saxony. The ores also ought to be raised by paying the workmen, not fixed wages, but a tribute or portion of the proceeds.

2. The half-civilised state of the inhabitants, their unsettled political condition, and the want of power or disposition on the part of those in power to make contracts be observed; and to hinder the former proprietors of the mines, or those connected with them, from setting up fictitious claims, and enforcing them by violence.

3. The high price of labour; the ignorance of the natives as to mechanics, and still more as to science. Hence the necessity of having artisans and confidential superintendents from Europe at a heavy expense.

On the other hand, the circumstances in favour of such undertakings are —

1. The abundance of silver ore, which is far greater than in any part of Europe.

2. The former success of mining in Mexico, under a system extremely rude and expensive, compared to that which is now followed in Germany.

3. The probability of peace in Europe, and of an abundance of monied capital; so that the failure of the present companies may not involve a relinquishment of their enterprises, any more than the failure of the first New River Company, about two centuries ago, implied an abandonment of their project. There is surely, also, some probability that anarchy and disorder will ultimately cease; and that the security of property will, in the end, be established. We confess, however, that these are but problematical and contingent events; and that it may reasonably be doubted whether any considerable future success can be anticipated.

It seems, however, as if there were something in mining speculations that renders them exceedingly unsuitable for joint stock associations. At all events, hardly one of the joint stock associations formed in this country for the working of mines has been successful. The company for working the copper mines near Santiago in Cuba appears to be the only one that has in any degree realised the magnificent prospects that were held out in 1824 and 1825 — (See for further information on this subject the arts. Precious Metals and Vera Cruz.)

MINIUM, or RED OXIDE OF LEAD, a tasteless powder of an intense red colour, often inclining to orange, and very heavy; its specific gravity being 8·94. It is extensively used in the arts.

MOBILE. See NEW ORLEANS, *ad finem*.

MOCHA, the principal port in the Red Sea frequented by Europeans, in that part of Arabia called Yemen, about 40 miles to the north of the Strait of Bab-el-mandeb, lat. 13° 19′ 30″ N., lon. 43° 20′ E. Population variously estimated; but may, perhaps, amount to from 5,000 to 7,000. It is encircled with walls, and indifferently fortified. Its appearance from the sea is imposing.

Mocha is situated on the margin of a dry sandy plain. It is built close to the shore, between 2 points of land which project and form a bay. Vessels drawing from 10 to 12 feet water may anchor within this bay at about a mile from the town; but large ships anchor without the bay in the roads, in 5 or 7 fathoms water — the grand mosque bearing E. S. E., and the fort to the south of the town S. by E., distant about two miles from the shore. The great article of export from Mocha is coffee, which is universally admitted to be of the finest quality. It is not possible to form any very accurate estimate of the quantity exported; but we believe it may be taken at 10,000 tons, or perhaps more. The greater portion is sent to Djidda and Suez: but there is a pretty large export to Bombay, and other parts of India, whence some is sent to Europe: occasionally, however, the exports from Mocha and Hodeida, direct from Europe, are very considerable. Besides coffee, the principal articles of export are, dates, adjoue, or paste made of dates, myrrh, gum Arabic, olibanum, senna (*cassia senna*), sharks' fins, tragacanth, horns, and hides of the rhinoceros, balm of Gilead, ivory, gold dust, civet, aloes, sagapenum, &c. The principal articles of import are, rice, piece goods, iron, and hardware, &c. The ivory, gold dust, and civet, met with at Mocha, are brought from the opposite coast of Abyssinia, whence are also brought slaves, ghee, &c.

The greater part of the foreign trade of Mocha is transacted by the Banians; and it is much safer to deal with them than with either Turks or Arabs. Europeans pay a duty of 3 per cent. *ad valorem* on all goods imported by them from Europe, India or China; the duty being levied on the amount of the sales. The buyer pays brokerage, cooley, and boat hire. All kinds of foreign goods are sold on credit, and the payment is made in 3 instalments, or at a certain day, according as may have been agreed on. Coffee is always paid for in ready money. On the sale of other goods, the produce of the country, a credit is given; or if ready money be paid, a discount is allowed at the rate of 9 per cent. When goods are discharging, the master must furnish the Custom-house officer with a manifest, or account of the marks, numbers, and contents of each package. He then opens two or three bales taken at random; and if they correspond with the account delivered, no further examination is made; but if they do not correspond, the whole bales are opened, and double duty is charged upon the excess. The quantities being thus ascertained, their value is learned from the account of sales rendered by the seller, and the duty charged accordingly. In this respect there is nothing to object to at Mocha; but a good deal of extortion is practised in the exaction of port charges, presents, &c., which may, however, be defeated by proper firmness. The port charges on ships, or *three-mast* vessels, may amount to about to 400 Mocha dollars, and those on brigs to about half as much. Provisions are plentiful and cheap; but water is dear: that in the vicinity being brackish and unwholesome, whatever is used for drinking, by all but the poorest persons, is brought from Mosa, about 20 miles off. Fish are abundant and cheap, but not very good.

Money. — The current coins of the country are carats and commassees; 7 carats = 1 commassee; 60 commassees = 1 Spanish dollar; 100 Spanish dollars = 122½ Mocha dollars.

Weights and Measures. — The commercial weights are —

15 Vakias = 1 Rottolo = 1 lb. 2 oz. avoird.
40 Vakias = 1 Maund = 3 lbs. avoird.
10 Maunds = 1 Frazel = 30 lbs. avoird.
15 Frazels = 1 Bahar = 450 lbs. avoird.

There is also a small maund of only 30 vakias; 1 Mocha bahar = 16½ Bombay maunds; 1 Mocha bahar = 13 Surat maunds = 15·125 seers. Grain is measured by the kellah, 40 of which = 1 tomand, about 170 lbs. avoirdupois. The liquid measures are 16 vakias = 1 nusseah; 8 nusseahs = 1 cuda, about 2 English wine gallons. The long measures are the guz = 25 English inches; the hand covid = 18 inches, and the long iron covid = 27 inches.

In compiling this article, we made use of *Milburn's Oriental Commerce*, and *Elmore's Directory*. Niebuhr has given a plan of the port of Mocha in his *Voyage en Arabie*, tome i. p. 318. ed. Amst. 1776. He has also given some details as to its trade in his *Description de l'Arabie*, p. 191. But the best account we have seen of Mocha is in *Hamilton's Account of the East Indies* (vol. i. pp. 40 — 52), an accurate and valuable work. Burckhardt did not visit Mocha; which is to be regretted.

MOGADORE, a sea-port town on the west coast of Morocco, lat. 31° 50′ N., lon. 9° 20′ W. Population about 10,000. It is indifferently fortified; the country in the immediate vicinity is low, flat, sandy, and unproductive. Water is scarce and rather dear; being either rain water collected and preserved in cisterns, or brought from a river about 1½ mile distant. The port is formed by a small island lying to the southward of the town; but as there is not more than 10 or 12 feet water in it at ebb tide, large ships anchor without, the long battery bearing E. distant 1½ mile. The principal imports are, English woollen and cotton stuffs and hardware, German linens, tin, copper, earthenware, mirrors, glass, sugar, pepper, paper, and a variety of other articles. The exports principally consist of sweet and bitter almonds, gum Arabic, and other gums, bees' wax, cow and calf skins, ivory, ostrich feathers, gold dust, olive oil, dates, &c.

The city of Morocco, distant from Mogadore about 4 days' journey (caravan travelling) derives its principal supplies of European produce from the latter; and considering this circumstance, and the brisk demand for most part of the articles exported from Mogadore, it might be supposed that its trade would be pretty extensive. But such is not the case; and the truth is that at an average of the 6 years ending with 1852, the value of our exports to Tripoli, Barbary, and Morocco, amounted to no more than 61,712*l.* a year. This, however, is not, in so far at least as respects Morocco, occasioned by any disinclination on the part of the natives to commerce, or by the unsuitableness of our products to their markets, but wholly by the oppressive duties which are laid on exports, and which raise their price much above the rates for which they can be procured elsewhere. A letter from Mogadore, in the *Times* of July, 1848, gives the following statement of the then London prices of the principal articles shipped from Mogadore with the export duties on the same:

Barbary Produce.	London Prices.	Mogadore Export Duty.	Barbary Produce.	London Prices.	Mogadore Export Duty.
	£ s. d.	£ s. d.		£ s. d.	£ s. d.
Sweet Almonds cwt.	2 0 0	0 6 3	Gum Sandrac - cwt	3 10 0	0 9 6
Bitter almonds - —	1 16 0	0 6 3	Ostrich feathers - case	100 0 0	31 5 0
Bees'-wax - —	6 0 0	2 1 6	Goats' skins - doz.	0 14 0	0 2 6
Wool (washed) - —	4 4 0	0 19 0	Sheep skins - —	1 5 0	0 1 6
Olive oil - —	1 19 0	0 9 6	Calf skins - - —	2 5 0	0 9 6
Brown gum - —	2 10 0	0 6 3			

"All these duties are rated in the local currency 25 per cent. higher than here stated; but as under an order from the emperor they must be paid in cash, the system of credit with government having been altogether abolished, that deduction is allowed in the shape of discount for prompt payment.

"The import trade is regulated on a widely different principle. The duties levied on imported articles are not paid in money, but in kind, and on English manufactures, army and navy cloth, brass, copper, tea, and sugar, and in fact in all cases, with few exceptions, are rated at 20 per cent., or a fifth part of the goods, whatever they may be, that are landed. This primitive mode of business is also accompanied by disadvantages, and assists, in conjunction with the high tariff, to cripple any endeavours attempted to bring the Barbary States in closer mercantile alliance with ourselves."

It is to be hoped that the government of Morocco may become alive to the mischievous consequences of this system. Nothing would do so much to promote industry and civilisation in the country, as the effectual reduction, or rather the total repeal of the existing duties on exports.

Money.—Accounts are kept in nutkeels of 10 ounces; the ounce being divided into 4 blankeels, and the blankeel into 24 fluce. From their proportion to the Spanish dollar, the blankeel may be valued at 1*d.*, the ounce at 4*d.*, and the nutkeel or ducat at 3*s.* 4*d.*

Weights and Measures.—The commercial pound is generally regulated by the weight of 20 Spanish dollars; and therefore, 100 lbs. Mogadore weight, or the quintal, = 119 lbs. avoirdupois. The market pound for provisions is 50 per cent. heavier, or 1 lb. 12½ oz. avoirdupois.

The corn measures are for the most part similar to those of Spain, but there are considerable discrepancies.

The cubit, or canna, = 21 English inches, is the principal long measure.

The most ample details with respect to the trade of Mogadore, and the trade and productions of Morocco in general, may be found in *Jackson's Account of Morocco*, c. 6, 7 and 13. see also *Kelly's Cambist*.

MOHAIR (Ger. *Mohr*; Fr. *Moire*; It. *Moerro*; Sp. *Mue*, *Muer*), the hair of a variety of the common goat, famous for being soft and fine as silk, and of a silvery whiteness. It is not produced any where but in the vicinity of Angora, in Asia Minor. The exportation of this valuable and beautiful article, unless in the shape of yarn, was formerly prohibited; but it may now be exported unspun. The production, preparation, and sale of mohair have long engrossed the principal attention of the inhabitants of Angora; and it used to form an important article of Venetian commerce. It is manufactured into camlets and other expensive stuffs. Hitherto but little has been imported into England.—(See, for further particulars, *Tournefort, Voyage du Levant*, ii. 463., where there is a figure of the goat; and *Urquhart on Turkey and its Resources*, p. 184.)

MOLASSES or MELASSES (Fr. *Sirop de Sucre*, *Melasses*; Ger. *Syrup*; It.

Mielazzo di zucchero; Sp. *Miel de azucar, Chancaca*; Port. *Melasso, Assucar liquido*; Rus. *Patoka sacharnaja*), the uncrystallisable part of the juice of the sugar cane, separated from the sugar during its manufacture. It is of a brown or black colour, thick, and viscid; has a peculiar odour, and a sweet empyreumatic taste. Molasses imported from the West India colonies and the Mauritius is charged, on being entered for home consumption, with a duty of 9*s.* a cwt., the duty on foreign molasses, which is quite prohibitory, being 23*s.* 9*d.* a cwt. It is not, however, used in its original state, but is purchased by the sugar-bakers, who, when it is of an ordinary degree of strength, extract from it a coarse, soft species of sugar called bastards, and treacle. But it is obvious, inasmuch as the duty on molasses is fixed, that the duty on the sugar extracted from it will vary indirectly according to the quantity of saccharine matter which it contains; and we understand that, in consequence, molasses is frequently imported so rich as to yield good crystallised sugar. We do not know whether the practice has been carried to such an extent as materially to injure the revenue: but it seems pretty clear that the duty should depend, in part at least, on the quality of the molasses, or on the quantity of saccharine matter which it contains, as well as on the weight. It is difficult — unless advantage has been taken of the way in which the duty is assessed, to elude the sugar duties — to account for the fact of the imports of molasses from the West India islands not having diminished in anything like the same proportion as the imports of sugar.

About 8 gallons of proof spirit may, it is said, be obtained from a cwt. of molasses, such as has recently been imported; but this depends, of course, wholly on the richness of the molasses.

Part of the refuse that remains, after refining muscovado sugar, is a sweet syrup, which, as well as the syrup that remains after boiling molasses to obtain bastards, is called treacle. But the treacle obtained from the former is always preferred to that obtained from the latter, and fetches 2*s.* per cwt. more.

Molasses is sometimes used in preparing the coarser sort of preserves; and on the Continent it is extensively used in the manufacture of tobacco.

In 1857, 599,497 cwt. molasses were entered for consumption, of which 359,177 cwt. were brought from Cuba. The duty during the same year amounted to 150,308*l.*

MONEY. When the division of labour was first introduced, commodities were directly bartered for each other. Those, for example, who had a surplus of corn, and were in want of wine, endeavoured to find out those who were in the opposite circumstances, or who had a surplus of wine and wanted corn, and then exchanged the one for the other. It is obvious, however, that the power of changing, and, consequently, of dividing employments, must have been subjected to perpetual interruptions, so long as it was restricted to mere barter. A. carries produce to market, and B. is desirous to purchase it; but the produce belonging to B. is not suitable for A. C., again, would like to buy B.'s produce, but B. is already fully supplied with the equivalent C. has to offer. In such cases—and they must be of a constant occurrence wherever money is not introduced—no direct exchange could take place between the parties; and it might be very difficult to bring it about indirectly.*

The extreme inconvenience attending such situations must early have forced themselves on the attention of every one. Efforts would, in consequence, be made to avoid them; and it would speedily appear that the best or rather the only way in which this could be effected, was to exchange either the whole or a part of one's surplus produce for some commodity of known value, and in general demand; and which, consequently, few persons would be inclined to refuse to accept as an equivalent for whatever they had to dispose of. After this commodity had begun to be employed as a means of exchanging other commodities, individuals would become willing to purchase a greater quantity of it than might be required to pay for the products they were desirous of immediately obtaining; knowing that should they, at any future period, want a further supply either of these or other articles, they would be able readily to procure them in exchange for this universally desired commodity. Though at first circulating slowly and with difficulty, it would, as the advantages arising from its use were better appreciated, begin to pass freely from hand to hand. Its value, as compared with other things, would thus come to be universally known; and it would at last be used, not only as the common medium of exchange, but as a standard by which to measure the value of other things.

Now this commodity, whatever it may be, is *money*.

An infinite variety of commodities have been used as money in different countries and periods. But none can be advantageously used as such, unless it possess several very peculiar qualities. The slightest reflection on the purposes to which it is applied,

* The difficulties that would arise on such occasions, and the devices that would be adopted to overcome them, have been very well illustrated by Colonel Torrens, in his work on the "Production of Wealth," p. 291.

must, indeed, be sufficient to convince every one that it is indispensable, or, at least, exceedingly desirable, that the commodity selected to serve as money should, (1) be divisible into the smallest portions; (2) that it should admit of being kept for an indefinite period without deteriorating; (3) that it should, by possessing great value in small bulk, be capable of being easily transported from place to place; (4) that one piece of money, of a certain denomination, should always be equal, in magnitude and quality, to every other piece of money of the same denomination; and (5) that its value should be comparatively steady, or as little subject to variation as possible. Without the *first* of these qualities, or the capacity of being divided into portions of every different magnitude and value, money, it is evident, would be of almost no use, and could only be exchanged for the few commodities that might happen to be of the same value as its indivisible portions, or as whole multiples of them: without the *second*, or the capacity of being kept or hoarded without deteriorating, no one would choose to exchange commodities for money, except only when he expected to be able speedily to re-exchange that money for something else: without the *third*, or facility of transportation, money could not be conveniently used in transactions between places at any considerable distance: without the *fourth*, or perfect sameness, it would be extremely difficult to appreciate the value of different pieces of money: and without the *fifth* quality, or comparative steadiness of value, money could not serve as a standard by which to measure the value of other commodities; and no one would be disposed to exchange the produce of his industry for an article that might shortly decline considerably in its power of purchasing.

The union of the different qualities of comparative steadiness of value, divisibility, durability, facility of transportation, and perfect sameness, in the precious metals, doubtless, formed the irresistible reason that has induced every civilised community to employ them as money. The value of gold and silver is certainly not invariable, but, generally speaking, it changes only by slow degrees; they are divisible into any number of parts, and have the singular property of being easily reunited, by means of fusion, without loss; they do not deteriorate by being kept; and, from their firm and compact texture, they are very difficult to wear. Their cost of production, especially that of gold, is so considerable, that they possess great value in small bulk, and can, of course, be transported with comparative facility; and an ounce of pure gold or silver, taken from the mines in any quarter of the world, is precisely equal, in point of quality, to an ounce of pure gold or silver dug from the mines in any other quarter. No wonder, therefore, when all the qualities necessary to constitute money are possessed in so eminent a degree by the precious metals, that they have been used as such, in civilised societies, from a very remote æra. "They became universal money," as Turgot has observed, "not in consequence of any arbitrary agreement among men, or of the intervention of any law, but by the nature and force of things."

When first used as money, the precious metals were in an unfashioned state, in bars or ingots. The parties having agreed about the quantity of metal to be given for a commodity, that quantity was then weighed off. But this, it is plain, must have been a tedious and troublesome process. Undoubtedly, however, the greatest obstacle that would be experienced, in early ages, to the use of gold and silver as money, would be found to consist in the difficulty of determining the degree of their purity with sufficient precision; and the discovery of some means by which their weight and fineness might be readily and correctly ascertained, would be felt to be indispensable to their extensive use as money. Fortunately, these means were not long in being discovered. The fabrication of coins, or the practice of impressing pieces of the precious metals with a stamp indicating their weight and purity, belongs to the remotest antiquity.—(*Goguet, De l' Origine des Loix, &c.* tome i. p. 269.) And it may safely be affirmed, that there have been very few inventions of greater utility, or that have done more to accelerate the progress of improvement.

It is material, however, to observe, that the introduction and use of coined money make no change whatever in the *principle* on which exchanges were previously conducted. The coinage saves the trouble of weighing and assaying gold and silver, but it does nothing more. It declares the weight and purity of the metal in a coin; but the *value* of that metal or coin is in all cases determined by precisely the same principles which determine the value of other commodities, and would be as little affected by being recoined with a new denomination, as the burden of a ship by a change of her name.

Inaccurate notions with respect to the influence of coinage seem to have given rise to the opinion, so long entertained, that coins were merely the *signs* of values! But it is clear they have no more claim to this designation than bars of iron or copper, sacks of wheat, or any other commodity. They exchange for other things, because they are desirable articles, and are possessed of real intrinsic value. A draft, check, or bill may not improperly, perhaps, be regarded as the sign of the money to be given for it. But that money is nothing but a commodity; it is not a sign—it is the thing signified.

Money, however, is not merely the universal equivalent, or *marchandise banale*, used by society: it is also the *standard* used to compare the values of all sorts of products; and the stipulations in the great bulk of contracts and deeds, as to the delivery and disposal of property, have all reference to, and are commonly expressed in, quantities of money. It is plainly, therefore, of the utmost importance that its value should be preserved as invariable as possible. Owing, however, to improvements in the arts, the exhaustion of old mines, and the discovery of new ones, the value of the precious metals is necessarily inconstant: though, if we except the effects produced in the 16th century by the discovery of the American mines, it does not appear to have varied so much at other times as might have been anticipated. Great mischief has, however, been repeatedly occasioned by the changes that have been made in most countries in the weight, and sometimes also in the purity, of coins; and since the impoliey of these changes has been recognised, similar, and perhaps still more extensive, disorders have sprung from the improper use of substitutes for coins. It is, indeed, quite obvious, that no change can take place in the value of money, without proportionally affecting the pecuniary conditions in all contracts and agreements. Much, however, of the influence of a change depends on its direction. An increase in the value of money is uniformly more prejudicial in a public point of view than its diminution: the latter, though injurious to individuals, may sometimes be productive of national advantage; but such can never be the case with the former. — (See *Principles of Political Economy*, by the author of this work, 3d ed. pp. 510—515.)

No certain estimate can ever be formed of the quantity of money required to conduct the business of any country; this quantity being, in all cases, determined by the value of money itself, the services it has to perform, and the devices used for economising its employment. Generally, however, it is very considerable; and when it consists wholly of gold and silver, it occasions a very heavy expense. There can, indeed, be no doubt that the wish to lessen this expense has been one of the chief causes that have led all civilised and commercial nations to fabricate a portion of their money of some less valuable material. Of the various substitutes resorted to for this purpose, paper is, in all respects, the most eligible. Its employment seems to have grown naturally out of the circumstances incident to an advancing society. When government becomes sufficiently powerful and intelligent to enforce the observance of contracts, individuals possessed of written promises from others, that they will pay certain sums at certain specified periods, begin to assign them to those to whom they are indebted; and when the subscribers are persons of fortune, and of whose solvency no doubt can be entertained, their obligations are readily accepted in payment of debts. But when the circulation of promises, or bills, in this way, has continued for a while, individuals begin to perceive that they may derive a profit by issuing them in such a form as to fit them for being readily used as a substitute for money in the ordinary transactions of life. Hence the origin of bank notes. An individual in whose wealth and discretion the public have confidence, being applied to for a loan, say of 5,000*l.*, grants the applicant his bill or note, payable on demand, for that sum. Now, as this note passes, in consequence of the confidence placed in the issuer, currently from hand to hand as cash, it is quite as useful to the borrower as if it had been gold; and supposing that the rate of interest is 5 per cent., it will yield, so long as it continues to circulate, a revenue of 250*l.* a year to the issuer. A banker who issues notes, coins, as it were, his credit. He derives the same revenue from the loan of his written promise to pay a certain sum, that he could derive from the loan of the sum itself, or of an equivalent amount of produce! And while he thus increases his own income, he, at the same time, contributes to increase the wealth of the public. The cheapest species of currency being substituted in the place of that which is most expensive, the superfluous coins are either used in the arts, or are exported in exchange for raw materials or manufactured goods, by the use of which both wealth and enjoyments are increased. Ever since the introduction of bills, almost all great commercial transactions have been carried on by means of paper only. Notes are also used to a very great extent in the ordinary business of society; and while they are readily exchangeable at the pleasure of the holder for coins, or for the precise quantities of gold or silver they profess to represent, their value is maintained on a par with the value of these metals; and all injurious fluctuations in the value of money are as effectually avoided as if it consisted wholly of the precious metals.

In common mercantile language, the party who exchanges money for a commodity is said to buy; the party who exchanges a commodity for money being said to sell. Price, unless where the contrary is distinctly mentioned, always means the value of a commodity estimated or rated in money. — (For a further account of metallic money, see the article Coin; and for an account of paper money, see the article Banks.)

MONOPOLY. By this term is usually meant a grant from the Crown, or other competent authority, conveying to some one individual, or number of individuals, the sole right of buying, selling, making, importing, exporting, &c. some one commodity, or

set of commodities. Such grants were very common previously to the accession of the House of Stuart, and were carried to a very oppressive and injurious extent during the reign of Queen Elizabeth. The grievance became at length so insupportable, that notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by the famous act of 1624, the 21 Jac. 1. c. 3. This act declares that all monopolies, grants, letters patent for the sole buying, selling, and making of goods and manufactures, shall be null and void It excepts patents for *fourteen* years for the sole working or making of any new manufactures within the realm, to the true and first inventors of such manufactures, provided they be not contrary to law, nor mischievous to the state. It also excepts grants by act of parliament to any corporation, company, or society, for the enlargement of trade, and letters patent concerning the making of gunpowder, &c. This act effectually secured the freedom of industry in Great Britain; and has done more, perhaps, to excite the spirit of invention and industry, and to accelerate the progress of wealth, than any other in the statute book.

MONTEVIDEO, a sea-port, and the capital of the republic of Uruguay, on the north bank of the Rio de la Plata, lat. 34° 54′ 11″ S., lon. 56° 13′ 18″ W. The population, which is variously estimated, may probably be about 12,000. The town is built in the form of an amphitheatre, on a regular plan and is well fortified. It has suffered much from the various revolutions to which it has been subject during the last 30 years.

Montevideo is situated 2° 3′ 33″ W. of Cape St. Mary, the northern limit of the embouchure of the La Plata. Vessels from the north bound to Montevideo generally make this cape, entering the river between it and the small island of Lobos, in from 14 to 17 fathoms. The course is thence nearly W. to the Isle of Flores, on which is a light-house 112 feet above the level of the sea, with a revolving light. From Flores to Montevideo is 16 miles in a direct line, and the course W. by S. by compass. A light-house, 475 feet above the level of the sea, has been erected on the summit of the Montevideo, whence the town has its name. The latter is built on a projecting tongue of land, the port being on its S. side. This, which is the best on the La Plata, is a large circular basin open to the S. W.; generally the water is shallow, not exceeding from 14 to 19 feet, but the bottom being soft mud, vessels are seldom damaged by grounding. It should, however, be observed that the depth of water in the harbour, as well as throughout the whole of the Rio de la Plata, depends very much on the direction and strength of the winds. The S. W. wind, called *pamperos*, blows right into the bay of Montevideo with much force, not unfrequently causing a rise of a fathom or more in depth of water! But it rarely occasions much damage to vessels properly moored with anchors to the S. W., S. E., and one to the N. — (*Blunt's American Pilot*, pp. 542—555.; *Coulier sur les Phares, &c.*)

Montevideo has a considerable commerce. The great articles of export consist of animal products, or of hides, beef, tallow, hair, bones, grease, wool, &c. The imports principally consist of British cottons, woollens, and hardware, flour, wine and spirits, linens, sugar, tobacco, boots and shoes, salt, &c.

Trade of the U. Kingdom with Montevideo.

Account of the Quantities and Values of the Principal Articles imported into the U. Kingdom from Montevideo in each of the 4 Years ending with 1857.

DUTIES ON IMPORTS.

In National or Foreign Vessels, at Montevideo.

1. Machinery, agricultural implements, instruments used in the arts and sciences, books, prints, and maps - - free.
2. Silk, raw and wrought, laces, blonde, gold, and silver embroidery, watches, jewellery, saltpetre, plaster of Paris, coal, timber, cotton fringe, and wooden hoops - 5 per cent.
3. Powder, pitch, tar, rosin, and naval stores - 13 —
4. All raw materials, and manufactured articles, not included in the preceding enumeration 15 per cent.
5. Sugar, Paraguay and China teas, cocoa, cassia lignea, and cinnamon, spices, drugs, and provisions in general - - 20 —
6. Furniture, pictures, looking glasses, musical instruments, all sorts of carriages, carts, &c., and harness, saddles, horses' furniture (excepting horse cloths of the manufacture of the adjacent provinces, which pay 15 per cent.), ready made clothes, boots and shoes,

liqueurs, brandy, wine, vinegar, ale and porter, cider, tobacco, and soap - 25 per cent.
Salt, 2 reals the fanega, shy 1*d.* per 290 lbs.
7. Hides of all classes, hair, horns, tallow, silver and gold, in bullion or coin - - free.

A small charge is made for warehousing and porterage on passing through the Custom-house. Goods may be bonded for an indefinite period, during which time they are subject to a moderate warehouse rent.

Foreign flour pays as follows:—
8 dollars per barrel, when wheat is worth 2 to 3 dollars per fanega, about 224 lbs.
6 dollars per barrel, when wheat is worth 3 to 5 dollars per fanega.
4 dollars, when wheat is worth 5 to 7 dollars.
2 dollars, when wheat is worth 7 to 9 dollars.
1 dollar, when wheat exceeds 9 dollars.

Wheat:—
3 dollars per fanega, when wheat is worth 2 to 3 dollars per fanega.
2 dollars, when wheat is worth 3 to 6 dollars.
1 dollar, when wheat is worth 6 to 10 dollars.
Nothing, when wheat is worth above 10 dollars per fanega.*
Goods transhipped, or shipped out of bond, pay 2 per cent.
Foreign goods, shipped in vessels of less than 150 tons burden, for ports of the Uruguay and Paraguay, pay only 1 per cent.
8. All goods imported, paying duties, are subject to pay an additional 1 per cent. to the consulado; ½ per cent. to the hospital; and, for the extinction of copper money*, 1 per cent. additional on all goods that pay 5 per cent.

On all goods that pay 15, 15, and 20 per cent. - 3 per cent.
On all goods that pay 25 per cent. - 5 —
On flour - - - 10 —
On wheat - - - 3 —

DUTIES ON EXPORTS.

In National or Foreign Vessels.

Ox and cow hides, 2 reals, 25 centesimos, for reconnidor valuations of 1 dollar, and 1 per cent. consulado.
Horse hides, 1 real for reconnidor, on valuations of 5 reals for reconnidor each, and 1 per cent. consulado.
All other produce of the country pays 4 per cent. on the market value, and 1 per cent. consulado.
Jerked and salt beef, pork, &c.; also all foreign goods that have paid the import duty, free.

* This has, much to the honour of the authorities and people, been already accomplished; but the duty is maintained for general purposes.

Gold and silver, coined or in bullion, 1 per cent.

	Vessels. *Foreign.*	*National.*
Port Charges.—Tonnage from beyond sea, 3 reals.	2 reals.	
During loading and unloading both classes, pay 1 dollar per day.		
Pratique, with pilot - -	- 8 dollars.	4 dollars.
Boat - -	- 2 —	2 —
Without pilot - -	- 4	2 —

National and foreign vessels, that neither discharge nor load cargo, and that do not remain more than six days, pay nothing; those that remain in the harbour more than six days pay one third of the above tonnage dues.

National vessels, and vessels belonging to the provinces of Buenos Ayres, employed within the river Plate, called coasting, pay for a licence for each voyage as follows:—

If 5 to	7 tons,	4 reals.	
8	15	10	or 1 dollar, 2 cents.
16	30	18	or 2 „ 2 „
31	45	26	or 3 „ 2 „
46	60	30	or 3 „ 6 „
61	80	38	or 4 „ 6 „
81	100	46	or 5 „ 6 „
101	and above	54	or 6 „ 6 „

Hospital Dues.—National and foreign vessels, sailing for a foreign port beyond sea or in the river Plate, pay 2 dollars for the vessel, 4 reals for the captain, 2 reals for each seaman, 1 dollar for each passenger.

Pilotage from Montevideo to Buenos Ayres to be paid in Montevideo.

If the draft of water do not exceed

9 feet Burgos measure,		50 dollars.
9 to	10 feet	60 „
10	11	70 „
11	12	80 „
12	13	100 „
13	14	120 „
14	15	140 „
15	16	160 „
16	17	190 „
17	18	220 „

Monies, Weights, and Measures.—Paper money there is none. Current money, the Brazilian patacon and Spanish dollar; they pass for 960 centesimos.
100 cents make a real.
800 cents, or 8 reals, make a dollar.
960 cents, or 9 reals 60 cents, make 1¼ current dollar, or 1 hard dollar or patacon.
Weights and measures same as those of Spain; for which see CADIZ, in the *Dict.*

MOROCCO, OR MAROQUIN (Ger. *Saffiam*; Fr. *Maroquin*; It. *Marrocchino*; Sp. *Marroqui*; Rus. *Safian*), a fine kind of leather prepared of the skins of goats, imported from the Levant, Barbary, Spain, France, &c. It is of various colours, as red, green, black, yellow, &c. When of the best quality it is superior to every other material for the binding of books. And a volume that is bound in morocco by a first-rate artist, provided it be well preserved, and of an age to be properly toned down and mellowed, is justly deemed a prize, and always fetches a very high price. Morocco is, however, very extensively counterfeited, and books said to be in morocco are often done up in the vilest sheep-skin, dyed and prepared in imitation of the genuine article. The fraud is easily discovered by connoisseurs, but it is perpetrated to a great extent on the ignorant and unwary.

MUNJEET, a species of *Rubia tinctorum*, or madder, produced in Nepaul and in various districts of India.

That which is brought to England is imported from Calcutta, and is cultivated in the high lands about Natpore in Purnea. The roots are long and slender, and when broken appear of a red colour. It is used in dyeing; the red which it produces being, though somewhat peculiar, nearly the same as that produced by European madder. Dr. Bancroft says that the colour which it imparts to cotton and linen is not so durable as that of madder: but that upon wool or woollen cloth its colour is brighter and livelier; and, when proper mordants are used, nearly, perhaps quite, as permanent.—(*Permanent Colours*, vol. ii. p. 279.) The best munjeet is in pieces about the bigness of a small quill, clean and firm, breaking short, and not pipy or chaffy. Its smell somewhat resembles liquorice root.

Being a very bulky article, as compared with its value, the freight adds greatly to its cost. This seems to be the principal reason of its being so very little used in Great Britain, that the entire imports during the 3 years ending with 1840, amounted to only 3,539 cwt. The brokers estimate that 4*l.* per ton of freight is equal to 11*s.* 1*d.* per cwt. on the value of the article; 5*l.* per ton being equal to 13*s.* 10*d.*; 6*l.* to 16*s.* 7*d.*; and 7*l.* to 19*s.* 4*d.*; and as the price of munjeet in bond varies from 12*s.* to 15*s.* a cwt. it is plain it cannot be imported in any considerable quantity, except when freights are very much depressed. It is mostly imported in small packets or bundles of 600 or 800 to the ton; but sometimes it is packed in bales like cotton.

MUSCAT, a city and sea-port situated on the east coast of Arabia, about 96 miles N.W. of Cape Rasselgate (Ras-el-had), in lat. 23° 38′ N., lon. 58° 37½′ E. Population uncertain: but estimated by Lieut. Wellsted at 40,000, which we incline to think beyond the mark. There are more Banians here than in any other city in Arabia. There are amongst them some very extensive merchants, who engross almost the whole pearl trade of the Persian Gulph, and the supply of corn from India. The negro slaves are numerous, and are generally stout, well made, and active.

The harbour, which is the best on this part of the Arabic coast, opens to the north, and is shaped like a horse-shoe. It is bounded on the W. and S. by the lofty projecting shores of the mainland, and on the E. by Muscat Island, a ridge of rocks from 200 to 300 feet high. The town stands on a sandy beach at the south end or bottom of the cove or harbour, about 1¼ mile from its mouth. The depth of water near the town

varies from 3 to 4 and 5 fathoms. Ships at anchor are exposed to the north and north-west winds; but as the anchorage is everywhere good, accidents are of very rare occurrence. The harbour is protected by some pretty strong forts. Vessels are not allowed to enter after dusk, nor to leave before sunrise. If the usual signal be made for a pilot, one will come off, but not otherwise. It is best to make them attend till the vessel be secured, as they have excellent boats for carrying out warp anchors.

Muscat is a place of considerable importance, being at once the key to, and commanding the trade of, the Persian Gulph. The dominions of the imaum, or prince, are extensive, and his government is more liberal and intelligent than any other in Arabia or Persia. The town, situated at the bottom of a high hill, is ill-built and filthy; and, during the months of July and August, is one of the hottest inhabited places in the world. The country in the immediate vicinity of the town is extremely barren; but it improves as it recedes from the shore. Dates and wheat, particularly the first, are the principal articles of produce. The dates of this part of Arabia are held in high estimation, and are largely exported, those of Bushire and Bussorah being imported in their stead. A date tree is valued at from 7 to 10 dollars, and its annual produce at from 1 to 1½ dollar. An estate is said to be worth 2,000, 3,000, or 4,000 date trees, according to the number it possesses.

But the place derives its whole importance from the commerce and navigation of which it is the centre. The imaum has some large ships of war, and his subjects possess some of the finest trading vessels to be met with in the Indian seas. The part of Arabia adjoining to Muscat is too poor to have any very considerable direct trade; but, owing to its favourable situation, the backward state of the country round the Persian Gulph, and the superiority of its ships and seamen, Muscat has become an important *entrepôt*, and has an extensive transit and carrying trade. Most European ships bound for Bussorah and Bushire touch at it; and more than half the trade of the Persian Gulph is carried on in ships belonging to its merchants.—(See BUSHIRE.) But, exclusive of the ports on the gulph, and the south and west coasts of Arabia, ships under the flag of the imaum trade to all the ports of British India, to Singapore, Java, the Mauritius, the east coast of Africa, &c. The pearl trade of the Persian Gulph is now, also, wholly centred at Muscat. All merchandise passing up the gulph on Arab bottoms pays a duty of ½ per cent. to the imaum. He also rents the islands of Ormuz and Kishmee, the port of Gombroon, and some sulphur mines, from the Persian government.

In the magazines of Muscat may be found every species of produce imported into or exported from the Persian Gulph. Various articles are also imported for the use of the surrounding country, and for the internal consumption of Arabia. Among these, the principal are rice, sugar, coffee from Mocha, cotton and cotton cloth, cocoa nuts, wood for building, slaves from Zanguebar, dates from Bushire and Bussorah, &c. Payment for these is chiefly made in specie and pearls; but they also export drugs of various descriptions, ivory, gums, hides, ostrich feathers, horses, sharks' fins, a sort of earthen jars, called martuban, to Tranquebar, dried fish, an esteemed sweetmeat called *hulwah*, and a few other articles.

The markets of Muscat are abundantly supplied with all sorts of provision. Beef, mutton, and vegetables of good quality may be had at all times, and reasonably cheap. The bay literally swarms with the greatest variety of most excellent fish. Water is excellent, and is conveyed to the beach in such a manner that the casks of a vessel may be filled in her boats while afloat. Fire-wood is also abundant, and is cheaper than at Bombay.

A duty of 5 per cent. is laid on imports, all exports being duty free. The entire value of the imports has been estimated at 900,000*l.*

Money, Weights, and Measures.—Accounts here are kept in goz and mamoodies: 20 goz=1 mamoody; and 20 mamoodies=1 dollar. All Persian, Turkish, and Indian coins, as well as French and German crowns, and Spanish dollars, are met with; their value fluctuating with the demand; and they are generally sold by weight.

The weights are, the cusha and maund; 24 cushas=1 maund=8 lbs. 12 oz. avoirdupois.

Niebuhr thinks that Muscat occupies the site of the Mosca of Arrian and other Greek writers—(*Voyage en Arabie*, vol. ii. p. 71. ed. Amst. 1780); a conjecture which seems to be confirmed, not merely by the resemblance of the name, but also by the terms applied by Arrian to Mosca being sufficiently descriptive of Muscat; and as the port is bounded on all sides by rocks, it must now present almost the same appearance as in antiquity. Dr. Vincent, however, though he speaks doubtfully on the subject, is inclined to place Mosca to the west of Cape Rasselgate.—(*Commerce and Navigation of the Ancients*, vol. ii. pp. 344—347. For further particulars, besides the authorities above referred to, see *Hamilton's New Account of the East Indies*, vol. i. p. 63.; *Fraser's Journey to Khorasan*, pp. 5—19.; *Wellsted's Travels in Arabia*, i. pp. 14—15. The longitude given above is that of *Arrowsmith's Chart of the Persian Gulph*.)

MUSK (Fr. *Musc*; Ger. *Bisam*; Du. *Muskus*; It. *Muschio*; Sp. *Almizele*; Rus. *Muscus*; Arab. and Pers. *Mishk*) is obtained from a species of deer (*Moschus moschiferus*) inhabiting the Alpine mountains of the east of Asia. The musk is found in a small bag under the belly. Musk is in grains concreted together, dry, yet slightly unc-

tuous, and free from grittiness when rubbed between the fingers or chewed. It has a peculiar, aromatic, and extremely powerful and durable odour; the taste is bitterish and heavy; and the colour deep brown, with a shade of red. It is imported into England from China in caddies containing from 60 to 100 oz. each; but an inferior kind is brought from Bengal, and a still baser sort from Russia. The best is that which is in the natural follicle or pod. Being a very high-priced article, it is often adulterated. That which is mixed with the animal's blood may be discovered by the largeness of the lumps or clots. It is sometimes mixed with a dark, highly coloured, friable earth; but this appears to the touch to be of a more crumbling texture, and is harder as well as heavier than genuine musk. 20 cwt. of musk are allowed to a ton. It was not permitted to be brought home in the China ships belonging to the East India Company.—(*Thomson's Dispensatory; Milburn's Orient. Com.*) In 1852 the imports and exports of musk were respectively 6,482 and 3,913 oz. After being reduced in 1832 the duty on musk was finally repealed in 1845.

MUSLIN (Ger. *Musselin, Nesseltuch;* Du. *Neteldoek;* Fr. *Mousseline;* It. *Mussolina;* Sp. *Moselina;* Rus. *Kissea*), is derived from the word *mousale* or *mouseln*, a name given to it in India, where large quantities are made. It is a fine thin sort of cotton cloth, with a downy nap on the surface. Formerly all muslins were imported from the East; but now they are manufactured in immense quantities at Manchester, Glasgow, &c. of a fineness and durability which rival those of India, at the same time that they are very considerably cheaper.—(See COTTON.)

MUSTARD (Ger. *Mustert, Senf;* Fr. *Moutarde;* It. *Mostarda;* Sp. *Mostaza;* Rus. *Gortschiza;* Lat. *Sinapis;* Arab. *Khîrdal;* Hind. *Râi*), a plant (*Sinapis*) of which there are several species, some of them indigenous to Great Britain. It was formerly extensively cultivated in Durham, but it is now seldom seen in that county. At present it is principally raised in the neighbourhood of York, and throughout other parts of the North Riding; and being manufactured in the city of York, is afterwards sold under the name of Durham mustard. Two quarters an acre are reckoned a good crop. Mustard is of considerable importance in the materia medica, and is extensively used as a condiment. It was not, however, known, in its present form, at our tables, till 1720. The seed had previously been merely pounded in a mortar, and in that rude state separated from the integuments and prepared for use. But, at the period referred to, it occurred to a woman of the name of Clements, residing in Durham, to grind the seed in a mill, and to treat the meal in the same way that flour is treated. Her mustard was, in consequence, very superior; and, being approved by George I., speedily came into general use. Mrs. Clements kept her secret for a considerable time, and acquired a competent fortune. In Bengal and other Eastern countries, mustard is extensively cultivated, as rape is in Europe, for the purpose of yielding oil.—(*Bailey's Survey of Durham*, p. 147.; *Loudon's Encyc. of Agric.*)

MYROBALANS are the dried fruits of different varieties of *terminalia*. The fruit, varying from the size of an olive to that of a gall-nut, consists of a white pentangular nut, covered by a substance about 2 lines in thickness. The latter, which is the only valuable part, is mucilaginous and highly astringent; and being separated from the nut is employed, with the best effect, both by dyers and tanners, especially the latter. It produces with iron a strong, durable, black dye and ink; and with alum a very full, though dark, brownish yellow. The imports vary considerably. In 1849 they amounted to 851 tons. It is brought from India, where it has long been employed in calico-printing and in medicine.—(*Bancroft on Permanent Colours*, i. 351, &c.)

MYRRH (Ger. *Myrrhen;* Du. *Mirrhe;* Fr. *Myrrhe;* Ital. and Sp. *Mirra;* Lat. *Myrrha;* Arab. *Murr*), a resinous substance, the produce of an unknown tree growing in Arabia and Abyssinia. It is imported in chests, each containing from 1 to 2 cwt. Abyssinian myrrh comes to us through the East Indies, while that produced in Arabia is brought by the way of Turkey. It has a peculiar, rather fragrant, odour and a bitter aromatic taste. It is in small irregularly shaped pieces, which can hardly be called tears. Good myrrh is translucent, of a reddish yellow colour, brittle, breaking with a resinous fracture, and easily pulverised. Its specific gravity is 1·36. When it is opaque, mixed with impurities, and either white, or of a dark colour approaching nearly to black, with a disagreeable odour, it should be rejected.—(*Thomson's Dispensatory.*)

N.

NAILS (Ger. *Nägel, Spiker;* Du. *Spykers;* Fr. *Clous;* It. *Chiodi, Chiovi, Aguti;* Sp. *Clavos;* Rus. *Gwosdi*), are small spikes of iron, brass, &c., which, being driven into wood, serve to bind several pieces together, or to fasten something upon them.

There is scarcely a town or village in Great Britain in which nails are not forged; but the principal seats of this useful branch of the iron manufacture are at Birmingham, Bilston, Wolverhampton, Dudley, and a small district in Derbyshire. The consumption of nails is immense; and the aggregate value of those annually produced is very large.

NANGASACKI, or NAGASACKI, a sea-port town on the south-west coast of the island of Ximo, one of the Japanese islands, being, according to Krusenstern, in lat. 32° 43′ 40″ N., lon. 130° 11′ 47″ E. The harbour extends, N.E. and S.W. about 2½ leagues, being, in most places, less than a mile in width. Ships lie in 5 or 6 fathoms water, within gunshot of the town, near the middle of the bay, where they are protected from all winds.

The Japanese islands are situated within the temperate zone. They are believed to contain from 25,000,000 to 50,000,000 of people, superior in industry and civilisation to every other Eastern nation, with, perhaps, the exception of the Chinese. Japan has some thousand miles of sea-coast, and at one time the inhabitants were much addicted to emigration, and carried on an extensive intercourse with the adjacent nations. But in consequence of the alarm occasioned by the attempts of the Jesuit missionaries to make converts to Christianity, the government, in 1637, expelled the missionaries, put to death their converts, and to obviate the possibility of such attempts being made in future, they prohibited, under the severest penalties, their own people from resorting to foreign parts, and foreigners from entering into or trading with Japan. And singular as it may seem, these exclusive and anti-social regulations have been carried out almost to the letter down to our own times. So far, indeed, as respects the emigration of Japanese, they have not been in any degree modified; but the prohibition against foreigners trading with the empire was so far relaxed, that 1 or 2 ships from Java, and 10 or 12 junks from China, were allowed to enter certain Japanese harbours. But, besides being confined within the narrowest limits, those engaged in this intercourse were subjected to a vexatious *surveillance*, and had to suffer many indignities. "The cargoes of the ships," says Mr. Crawfurd, "are landed by, and placed in charge of, the officers of the Japanese government, and the Dutch have neither control over, nor access to them, except through *solicitation*. The island of Desima, to which they are confined, communicates with the town of Nangasacki by a bridge and a gate, and is palisadoed all round as well as surrounded by a guard. From this imprisonment they are allowed to peep twice or thrice a year, rather to be exhibited to the great as a curiosity, than out of indulgence. A corps of constables and interpreters are appointed to watch over their minutest actions; and the most degrading servilities are exacted from the highest among them, by the meanest officers of the Japanese government.

"The Chinese trade with Japan is principally conducted from the port of Ningpo, in the province of Chekiang, which is so conveniently situated that 2 voyages may be performed in the year, even by the clumsy junks of China. The commodities with which the Chinese furnish the Japanese consist of raw sugar, cow and buffalo hides, wrought silks, consisting chiefly of satins and damasks, eagle and sandal wood, ginseng, tutenague or zinc, tin, lead, fine teas, and, for more than 100 years back, some European broad cloths and camlets. The exports consist of copper, limited to 15,000 piculs, or about 900 tons; camphor, sabre blades, pearls, some descriptions of

The following are the quantities and value of goods exported and imported by the Dutch in their trade with Japan in 1825; the ships employed being 1 of 600 and 1 of 700 tons burden.

Opening of the Trade. — But after the trade to China had been thrown open, and the late events in that empire had brought English, French, and American squadrons to the gates, as it were, of Japan, it was not to be expected that its rulers would be able much longer to maintain their jealous, anti-social policy. The occurrences in China made them aware of the power, and in some degree, also, of the policy of those with whom they had now to deal. In 1853, when the American squadron under Commodore Perry appeared in their waters, they were fain to allow them to take in water and other stores; and in the following year, when they revisited their shores, they concluded a treaty with them*, in the 7th art. of which it is stipulated that citizens of the U. States resorting to the ports of Japan opened to them by the treaty, and bringing with them gold and silver coins and goods, were to be permitted to exchange them for other goods under such regulations as the Japanese government might think fit to establish. Soon after this treaty had been negotiated, Sir James Stirling, who then commanded the English naval forces in these parts, entered into a similar, though less liberal, arrangement with the government of Japan. The concessions that had thus been made, coupled with the circumstances connected with the late proceedings of the English, French, and other foreigners in China, paved the way for others of a still more extensive character. And, at length, in 1858, the system of exclusion was wholly abandoned, and a free commercial policy established in its stead. This great change was effected by the British plenipotentiary, the Earl of Elgin. Having negotiated a new, and comparatively liberal commercial treaty with China, this sagacious diplomatist proceeded to Japan, and there completed his mission, by inducing the Japanese government to enter into the well-considered treaty, an abstract of which is subjoined. Similar treaties have since been concluded with the Americans and the Dutch.

It is to be hoped that these remarkable events may be as advantageous to those whose markets are now opened to the products of this and other countries as it can hardly fail to be to ourselves. But much circumspection will be necessary, especially at the commencement of the new system. And we would fain hope that the pioneers at least of British enterprise in this new and peculiar region, may be distinguished by their good faith, and by their respect for the prejudices of the very singular and suspicious people with whom they will have to transact business.

We regret to observe that the importation of opium is prohibited by the new treaty. The taste for it is understood to have made considerable progress in Japan, and, if so, the prohibition will serve no good purpose, and will merely give a stimulus to smuggling.

It is not possible, in speaking of a country so little known as Japan, to form any estimate of the nature and extent of the commerce that may be carried on with her. The Japanese have attained to considerable eminence in various industrial pursuits, and their lacquered wares, hence called by Europeans "Japanned," are superior to those of every other country. Probably we shall find an outlet in Japan for considerable quantities of our woollen and cotton fabrics, and for iron, glass ware, and hardware, jewellery, sugar, drugs, spices, &c. In exchange we shall probably bring back copper, the precious metals, camphor, silk, Japan ware, and a great variety of other articles. Already, indeed, a cargo of vegetable wax, a new and very valuable product, has found its way from Japan to this market. (*See* VEGETABLE WAX.) And we have no doubt, if it be conducted with ordinary discretion, that the trade will progressively grow up to be of considerable value and importance, and will, most likely, embrace articles of which we are at present totally ignorant.

Summary of the Treaty between Her Britannic Majesty and the Emperor of Japan. — Signed at Yedo, August 26th, 1858.

Article I. Stipulates for peace and friendship.

Art. II. Stipulates for the reciprocal right to appoint a diplomatic agent at Yedo and London, and

* Called from the place where it was signed, the treaty of Kanagawa.

consular agents at the open ports. The British diplomatic agent and consul-general may travel to any part of Japan, and the Japanese diplomatic agent and consul-general to any part of Great Britain.

Art. III. The ports and towns of Hakodadi, Kanagawa, and Nagasaki, to be opened to British subjects on July 1, 1859. Nee-e-gata, or, if that is unsuitable as a harbour, some other port on the west coast of Nipon, on January 1, 1860. Hiogo on January 1, 1863. In all these places British subjects may permanently reside, and may lease ground and purchase and erect buildings, but shall not erect fortifications. They are not to be confined by any wall or gate, and their free ingress and egress not to be impeded. The limits within which British subjects may travel are defined. The general limit is ten *ri* (each *ri* being 4,275 yards) in any direction. After January 1, 1862, British subjects may reside at Yedo, and from January 1, 1863, in Osaca, for purposes of trade only. In each of these cities a suitable district for their residence, and the distance to which they may go, shall be arranged by the British diplomatic agent for the Japanese government.

Art. IV. All questions arising between British subjects in the Japanese dominions shall be under the jurisdiction of the British authorities.

Art. V. Japanese guilty of any criminal act towards British subjects shall be punished by the Japanese authorities. British subjects who may commit any crime against Japanese, or other foreigners, shall be punished by the British authorities, according to British law.

Art. VI. Mode of settling complaints of British against Japanese, or of Japanese against British.

Art. VII. The authorities on either side are to do their best to enforce recovery of debts due by their own people to those of the other nation, without, however, being responsible for payment.

Art. VIII. The Japanese government will place no restriction upon the lawful employment of Japanese by British subjects.

Art. IX. British subjects to have free exercise of their religion in Japan, and may erect places of worship.

Art. X. Foreign coin to be current in Japan; the value to be determined by weight. Coin (except Japanese copper coin), and foreign gold and silver, may be exported.

Art. XI. Supplies for the British navy may be landed and stored at Kanagawa, Hakodadi, and Nagasaki, free from duty; but, if any are sold, the purchaser must pay the proper duty.

Art. XII. If any British vessel be wrecked on the coast of Japan, the Japanese authorities shall render assistance to vessel and crew, and send the latter, if necessary, to the nearest consular station.

Art. XIII. British merchant-vessels may employ a pilot to take them in or out of port.

Art. XIV. At each of the open ports, British subjects may import and export, directly or indirectly, any lawful merchandise, paying the duties prescribed by the treaty. With the exception of munitions of war, which shall be sold to the Japanese government alone, they may freely buy from, and sell to, Japanese any articles they may have for sale; and Japanese may buy and use the same.

Art. XV. Mode of determining the value of goods imported.

Art. XVI. All goods imported into Japan by British subjects, which have paid the import duty, may be transported by the Japanese to any part of the empire without any further duty.

Art. XVII. British merchants who have imported merchandise, and paid the duty, shall be entitled to a certificate of the payment, and may then re-export it, and land it in any other port without any additional duty.

Art. XVIII. The Japanese authorities at each port shall adopt proper means to prevent smuggling.

Art. XIX. All penalties and confiscations made under the treaty shall belong to the Tycoon of Japan.

Art. XX. The articles for regulation of trade appended to the treaty are to be considered as part of it, and equally binding. The British diplomatic agent, in conjunction with the Japanese government, may make such rules as may be necessary for carrying out both treaty and articles.

Art. XXI. The treaty being signed in English, Japanese, and Dutch, the Dutch text shall be considered the original. All official communications from British diplomatic and consular agents to be written in English, but, for a period of five years, to be accompanied by a Dutch or Japanese translation.

Art. XXII. Either party may demand a revision of the treaty on or after July 1, 1872.

Art. XXIII. The British government and British subjects shall be entitled to equal participation in all advantages granted, or hereafter granted, in Japan to the government and subjects of any other nation.

Art. XXIV. Ratifications to be exchanged within a year.

Regulations for British Trade.

Regulation I. The captain of a vessel is to exhibit to the Japanese authorities, within 48 hours of his arrival (Sunday excepted), proof that he has deposited his ship's papers at the British consulate, and shall then make entry of his ship in writing, and deposit a written manifest of his cargo, stating who are the consignees, and adding a list of his stores. Any error may be corrected within 24 hours without fee; afterwards 15 dollars must be paid. Any goods not entered in the manifest will pay double duty. Any captain neglecting to enter his ship within the time prescribed shall pay a penalty of 60 dollars a day.

Reg. II. Japanese custom-house officers may be placed on board any ship in port, except ships of war. No goods to be unladen between sunset and sunrise. Hatches may be secured by the Japanese officers, and any person breaking the fastening shall pay a fine of 60 dollars for each offence. Any goods discharged from a ship without having been duly entered, shall be liable to confiscation. Packages with goods of value fraudulently concealed, and not mentioned in the invoice, shall be forfeited. If any British ship is engaged in smuggling, she shall pay a fine of 1,000 dollars, and the goods shall be forfeited. Vessels needing repairs may land their cargo without payment of duty, under supervision of the Japanese authorities. If any part be sold, duty to be paid thereon. Cargo may be transhipped from one vessel to another, under supervision, and on proof of *bonâ fide* nature of the transaction. Importation of opium being prohibited, if any British vessel has more than 3 catties weight on board, the surplus quantity may be seized and destroyed, and any person smuggling opium shall be liable to a fine of 15 dollars a catty.

Reg. III. Mode of entering goods by the owner or consignee. The entry is to state the name of the enterer, and of the ship, the marks, contents, and value of each package. The original invoices to be presented to the Japanese custom-house. The Japanese officers may examine the packages, but without expense or unreasonable delay. If the importer or owner should find that his goods have been damaged on the voyage, he may apprise the custom-house, and have the damage appraised, so as to make a deduction from the value in his entry. All goods intended for export must be entered at the Japanese custom-house before they are shipped. Any goods shipped without having been so entered, and all packages containing prohibited articles, shall be forfeited. No entry shall be required for supplies for ships, and their passengers and crews, nor for passengers' clothing, &c.

Reg. IV. Ships wishing to clear must give 24 hours' notice at the custom-house. If clearance be refused, the captain or consignee, and the British consul, must be informed of the reason. British ships of war shall not be required to enter or clear, nor shall they be visited by the customs or police. Mail steamers may enter and clear on the same day, and shall not be required to deliver a manifest, except for passengers and goods to be landed in Japan. Whale ships touching for supplies, and ships in distress, shall not be required to deliver a manifest, unless they wish to trade.

Reg. V. Any person signing a false declaration or certificate, with intent to defraud the revenue of Japan, shall pay a fine of 125 dollars for each offence.

Reg. VI. No tonnage duties shall be levied on British ships in the ports of Japan, but the following fees shall be paid to the Japanese custom-house authorities:—For the entry of a ship, 15 dollars: for the clearance of a ship, 7 dollars: for each permit, 1½ dollar: for each bill of health, 1½ dollar: for any other document 1½ dollar.

Reg. VII. Duties shall be paid to the Japanese government, on all goods landed in the country, according to the following tariff:—

Class 1. All articles in this class shall be free of duty: gold and silver, coined or uncoined; wearing apparel, in actual use; household furniture and printed books, not intended for sale, but the property of persons who come to reside in Japan.

Class 2. A duty of 5 per cent. shall be paid on the following articles: all articles used for the purpose of building, rigging, repairing, or fitting out of ships; whaling gear of all kinds; salted provisions of all kinds; bread and bread stuffs; living animals of all kinds; coals; timber for building houses; rice; paddy; steam machinery; zinc; lead; tin; raw silk; cotton and woollen manufactured goods.

Class 3. A duty of 35 per cent. shall be paid on all intoxicating liquors.

Class 4. All goods not included in any of the preceding classes, shall pay a duty of 20 per cent. All articles of Japanese production, which are exported as cargo, shall pay a duty of 5 per cent., with the exception of gold and silver coin, and copper in bars. Rice and wheat, the produce of Japan, shall not be exported from Japan as cargo; but all British subjects resident in Japan, and British ships for their crews and passengers, shall be furnished with sufficient supplies of the same. Foreign grain brought into any open port of Japan in a British ship, if no part thereof has been landed, may be re-exported without hindrance. The Japanese government will sell, from time to time, at public auction, any surplus quantity of copper that may be produced. Five years after the opening of Kanagawa, the import and export duties shall be subject to revision, if either the British or Japanese government desires it.

Money.—Accounts are kept in taels, mace, and candarines; 10 candarines make 1 mace, and 10 mace 1 tael. The Dutch reckon the Nangasacki tael at 3½ florins, equal to about 6*s.* 2*d.* The gold coins current are the new and old itjib and cobangs, or cobangs; the silver coins are, the nandiogin, itaganme, and kodama. They are in general very simple, struck plain and unadorned, the greater part of them without any rim round the margin, and most of them without any determined value. For this reason they are always weighed by the merchants, who put their chop or stamp upon them, to signify that the coin is standard weight and unadulterated.

The new cobangs are oblong, rounded at the ends, and flat, about 2 inches broad, scarcely thicker than an English farthing, of a pale yellow colour; the die on one side consists of several cross lines stamped; and at both ends there is a rectangular figure, with raised letters on it, and, besides, a moonlike figure, with a flower on it in relief. On the other side is a circular stamp, with raised letters on it; and within the margin, towards one end, two smaller sunk stamps with raised letters, which are different on each cobang; they are valued at 60 mace. There are old cobangs occasionally met with, which are of fine gold, somewhat broader than the new.

The old cobangs weigh 371 Dutch asen, or 275 English grains, and the gold is said to be 22 carats fine, which would give 44*s.* 7*d.* for the value of the old cobang. But the Japanese coins are reckoned at Madras only 87 touch, which is 20 22 25 carats; this reduces the old cobang to 41*s.* 10*d.* The new cobangs weigh 180 grains; the gold is about 16 carats fine, and the value 21*s.* 3*d.* The oban is thrice the value of the cobang.

The itjib is called by the Dutch golden bean, and is made of pale gold, of a parallelogramical figure and flat, rather thicker than a farthing, with many raised letters on one side and two figures or flowers in relief on the other; the value of this is ½ of a cobang. There are old itjibs also to be met with; these are thicker than the new ones, and in value 22 mace 5 candarines.

Nandiogin is a parallelogramical flat silver coin, of twice the thickness of a halfpenny, 1 inch long and ½ inch broad, and formed of fine silver. The edge is stamped with stars, and within the edges are raised dots. One side is marked all over with raised letters; and the other on its lower and larger moiety, is filled with raised letters, and at the same time exhibits a double moonlike figure. Its value is 7 mace 5 candarines.

Itaganme and kodama are denominations by which various lumps of silver, without form or fashion, are known, which are neither of the same size, shape, nor value. The former of these, however, are oblong, and the latter roundish, for the most part thick, but sometimes, though seldom, flat. These pass in trade, but are always weighed in payment from one individual to another, and have a dull leaden appearance.

Seni is a denomination applied to pieces of copper, brass, and iron coin, which bear a near resemblance to our old farthings. They differ in size, value, and external appearance, but are always cast, and have a square hole in the middle, by means of which they may be strung together; and likewise have always broad edges. Of these are current, sjumon seni, of the value of 4 common seni, made of brass, and almost as broad as a halfpenny, but thin. The common seni are the size of a farthing, and made of red copper; 60 of them = 1 mace. Doosa seni is a cast iron coin, in appearance like the last, of the same size and value, but is so brittle that it is easily broken by the hand, or breaks in pieces when let fall on the ground.

The seni are strung 100 at a time, or as is most commonly the case, 96 on a rush. The coins in one of these parcels are seldom all of one sort, but generally consist of 2, 3, or more different kinds; in this case, the larger ones are strung on first, and then follow the smaller; the number diminishing in proportion to the number of large pieces in the parcel, which are of greater value than the smaller.

The schuit is a silver piece of 4 oz. 18 dwts. 16 grs. Troy, and is 11 oz. fine, which gives its value 1*l.* 5*s.* 3*d.* The name is Dutch, referring, probably, to its shape, like a boat.

Weights.—These are the candarine, mace, tael, catty, and picul, thus divided:—

10 candarines	=	1 mace.
10 mace	=	1 tael.
16 taels	=	1 catty.
100 catties	=	1 picul.

The picul=125 Dutch pounds, or 133¼ lbs. avoirdupois. It is, however, said to weigh only 130 lbs.

Measures.—The revenues of Japan are estimated by two measures of rice, the man and koif; the former contains 10,000 koifs, each 3,000 bales or bags of rice.

The long measure is the inc, which is about 4 Chinese cubits or 6½ feet English nearly; and 2½ Japanese leagues are computed to be about 1 Dutch league.—(*Milburn's Orient. Com.*)

NANKEEN, or NANKIN (Ger. *Nanking*; Du. *Nankings linnen*; Fr. *Toile de Nankin*; It. *Nanquino*; Span. *Nanquina*), a species of cotton cloth in extensive use in this country. It takes its name from Nanking, in China, a European corruption of Kyang-ning, the capital of the extensive province of Kyang-nan, where it is principally produced, and which also furnishes the greater part of the green teas. In the East, the manufacture is wholly confined to China.* The cloth is usually of a yellowish, though occasionally it is of a blue colour, and of different degrees of fineness; the broad pieces called "the Company's nankeens," are generally of a better quality than the narrow ones, and are most esteemed. We produce imitation nankeens at Manchester and other places, but it must be admitted that they are inferior to the Chinese; neither lasting so long, nor holding their colour so well. The colour, whether yellow or blue, is given to the cloth by dyeing; for though yellow cotton wool be raised in the East, the cloth made from it is too glaring. The nankeens brought to England come under the general denomination of piece goods. They are mostly made into trowsers and waistcoats for gentlemen's wear during summer, ladies' pelisses, &c. In some of the more southern parts of Europe, the warmer parts of Asia and America, and the British settlements in Africa, nankeen is worn by both sexes all the year round, and constitutes the principal

* It was stated in the first edition of this work, on authority which should not have been trusted to, that the manufacture of nankeen was carried to great perfection in the East Indies: but, in point of fact, the manufacture is wholly unknown everywhere in the East except China.

article of attire. Latterly, however, they have become unfashionable in this country, and their importation has, in consequence, all but ceased. (See article CANTON, for an account of the imports of Nankeen.)

NANTES, a large commercial city and sea-port of France, on the Loire, about 34 miles from its mouth, lat. 47° 13′ 6″ N., lon. 1° 32″ 44″ W. Population, in 1851, 96,362. Vessels drawing 18 and 19 feet water come up to Paimbœuf, about 24 miles lower down the river; but no vessel, drawing more than 11 or 12 feet can come up to the city, unless at high water a day or two before *full* and *change*.

Entrance to the Loire.—There are 3 entrances to the Loire. The first and most generally frequented is between the bank called *Le Four* and Point *Croisic*: there is a second between Le Four and the bank called *La Banche*; and the third, which in southerly winds is much resorted to, between the latter and the rocks called *La Couronne*. The navigation, which is naturally rather difficult, has been much facilitated by the erection of lighthouses and beacons. Of the former, one has been recently constructed on the north part of Le Four, about a league from Croisic, in lat. 47° 17′ 53″ N., lon. 2° 38′ 3″ W. It is 56 feet high. The light is a revolving one; the flash, which continues for 7 seconds, being succeeded by a dark interval of 53 seconds. Two lighthouses, called the Aiguillon lights, stand on the north side of the river, near its mouth; the lower light, adjoining *Point de Levi*, being in lat. 47° 14′ 33″ N., lon. 2° 15′ 46″ W. The light is fixed, and is 111 feet above the level of the sea. The upper Aiguillon light, situated about a mile N. 31° E. from the lower, is 127 feet high; it also is a fixed light, varied, however, by a flash every 3 minutes. A beacon tower, called the Turk, is erected on the southernmost extremity of La Blanche; the course for vessels entering between it and *La Couronne*, is to bring the Aiguillon lights in one. The depth of water on the bar at the mouth of the river varies from 2 to 2¾ fathoms. At springs the rise is 14, and at neaps 7 or 8 feet. High water at full and change 3¾ hours.

Trade, &c.—Her situation renders Nantes the emporium of all the rich and extensive country traversed by the Loire, so that she has a pretty considerable import and export trade, particularly with the West Indies. The exports consist of all sorts of French produce, but principally of brandy, wine and vinegar, silk, woollen and linen goods, refined sugar, wheat, rye, biscuits, &c. The principal imports are sugar, coffee, and other colonial products, cotton, indigo, timber, hemp, &c. Nantes is a considerable *entrepôt* for the commerce of salt, large quantities being made in the department, principally at Noirmutier and Croisic. During the time that the slave trade was carried on, Nantes was more extensively engaged in it than any other French port.

The customs duties of Nantes, exclusive of those on salt, produced in 1851, 10,817,000 fr., and in 1857, 29,676,000 fr., showing a greater increase of trade than any other port in France. There belonged to the port, ex river craft, coasters, and steamers, on the 31st December, 1857, 645 ships of the agg. burden of 105,698 tons.

Pilotage.—Vessels under 80 tons (if French or assimilated by treaty) are not obliged to take a pilot at sea, but must have one for the river. The rates, which are fixed by law, are paid by the *foot* from the sea to Paimbœuf, and *from thence* to Nantes for all vessels under 80 tons. Above 80 tons, they are per ton. The master of a vessel bound to Paimbœuf or Nantes has merely to give a note to the pilot stating where the pilot boarded him, where he left him, the name and draught of water of his vessel in *English* feet. The note will be deposited at the pilot's office, and the pilotage be received from the ship's broker. No foreign vessel (however small) can be removed from one anchorage to another, or to or from a quay, but by a pilot.

Quarantine.—Every vessel is boarded at St. Nazaire, and if she has a foul bill of health, or disease on board, is instructed where to go.

River Dues on vessels ascending from Paimbœuf to Nantes are about 1½*d.* per ton. At Paimbœuf, and below it, none are levied.

Averages in the River.—If a vessel under sail causes damage to another that is properly moored, she must pay all the expenses of repairs; if to a vessel at single anchor (unless intentionally done) or under sail, the expense of the repairs of both are added together, and each pays a moiety. The same rule is enforced if damage be caused by one vessel properly moored driving on board another in the same situation; but if either were riding at single anchor, the one properly moored is indemnified; if both were at single anchor, both bear the loss alike.

Monies, Weights, and Measures same as the rest of France.—(See BORDEAUX.)

Tares.—2½ per cent. on coffee in bags; real on ditto in hhds., casks, &c.; 6 per cent. on cottons; real on indigo; 17 per cent. on Brazil muscovado sugar, 19 per cent. on Martinique and Guadaloupe ditto, 13 per cent. on ditto clayed.

NAPLES, a large city and sea-port in the south of Italy, the capital of the kingdom of the same name, the lighthouse being in lat. 40° 50′ 12″ N., long. 14° 14′ 15″ E. Population, in 1851, 416,475. Naples is well situated for commerce; but the policy of the government has hitherto been most unfavourable to its growth, and has confined it within comparatively narrow limits.

Harbour,—The bay of Naples is spacious, and is celebrated for its picturesque views. The harbour is formed by a mole, built nearly in the form of the letter L, having a lighthouse on its elbow. Within the mole there is from 3 to 4 fathoms water, the ground being soft. The water in the bay is deep, and there is no bar: it is, however, a good deal exposed to the south-westerly winds; and to guard against their effects, vessels lying in the bay moor with open hawse in that direction. There is no obligation to take a pilot on board, but it is usual to take one the first time that a ship anchors within the mole. The lighthouse has a revolving light. The period of revolution is 2 minutes, during the first of which the

full strength of the light is continued, and during the second minute its brilliancy rapidly decreases. The height of the light is 161 feet above the sea, and it is visible at the distance of 18 or 20 miles. At the extremity of the mole is a low fixed light to guide vessels round its head.

Money.—Accounts are kept at Naples in ducati di regno of 100 grani. According to the new monetary system introduced in 1818, the unit of coins is the silver ducat=3*s.* 5½*d.* sterling. The ducat = 10 carlini; and there are coins of 1, 2, 6, and 12 carlini in proportion. Coins of a less value than 1 carlini are in copper. The smallest gold piece is the oncetta = 10*s.* 3½*d.* sterling.

Weights and Measures.—The commercial weights are the cantaro and rottolo. The cantaro *grosso* = 100 rottoli = 196¾ lbs. avoirdupois=89·105 kilog. = 184 lbs. of Hamburg = 180·4 lbs. of Amsterdam. The cantaro piccolo=106 lbs. avoirdupois = 48 kilog.

In dry measure, the carro of corn contains 56 tomoli. The tomoli = 1·45 Winch. bush.

In wine measure, the carro is divided into 2 botti, or 24 barilli, or 1,440 caraffe. The carro = 264 English wine gallons.

In oil measure, the salma is divided into 16 staje, 256 quarti, or 1,536 misurette. The salma at Naples = 42⅜ English wine gallons: at Gallipoli it is from 3 to 4 per cent. less; at Bari it is a little larger.

In long measure, the canna is divided into 8 palmi, or 96 onzie, and is = 6 feet 11 inches English. Hence the palmo = 10·38 English inches.

Eleven salme are allowed to a ship's last.—(*Nelkenbrecher; Kelly.*)

Exports and Imports. — The exports principally consist of the products of the adjacent country. Of these, silk is the most important. Olive oil is also a most important article; but it is principally supplied by Gallipoli, a town in the Terra d'Otranto, whence it is commonly called Gallipoli oil. The entire exports of oil from the kingdom of Naples have been estimated at about 200,000 salme, or 36,333 tuns, a

year, which, taking its mean value when exported at 21*l.* per tun, is equivalent to the annual sum of 762,993*l.* — (See Olive Oil.) The other articles of export are wool, wine, brandy, dried fruits, red and white argol, tallow, liquorice, gloves, madder, hemp, linseed, cream of tartar, bones, lamb and kid skins, oak and chesnut staves, rags, saffron, &c. There is a great variety in the Neapolitan wines. The most esteemed is the *lacrima Christi*, a red luscious wine, better known in England by name than in reality, the first growths being confined to a small quantity only, which is chiefly reserved for the royal cellars. There are, however, large quantities of second-rate wines produced in the vicinity of Naples, such as those of Pozzuoli, Ischia, Nola, &c., which are sold under the name of *lacrima Christi*, and are largely exported. Several parts of Calabria produce sweet wines of superior quality. (*Henderson's Ancient and Modern Wines*, p. 239.) The price of wine at Naples depends entirely on the abundance of the vintage; only a small quantity comes to England. The imports consist principally of English cottons and cotton twist, hardware, iron and tin, woollens, sugar, coffee, indigo, spices, &c. Naples is a good market for pilchards, and it requires a large supply of dried and barrelled cod.

Trade of the U. Kingdom with the Two Sicilies.

We also exported to the Two Sicilies in 1856 and 1857, foreign and colonial produce of the value of 197,928*l.* in the former, and of 160,448*l.* in the latter year.

These tables do not give a very favourable view of our trade with the Neapolitan dominions. The imports of olive oil have declined from 11,714 tuns in 1850, to 5,704

tuns in 1857. There was from 1852 to 1855, both included, a great falling off in our exports to the Two Sicilies; but they have again increased, and amounted in 1858 to 6,569,296*l.*, being very decidedly greater than in any previous year. They consist principally of cottons and cotton yarn (the latter being a most important article), iron, linens and woollens, coal, machinery, and hardware, copper, tin, &c. But though considerable, our trade with Naples does not certainly amount to $\frac{1}{4}$ part of what it would be were the government to adopt and follow out a liberal commercial policy. No country is better situated, or has greater capacities of production; and it is but fair to state that some considerable improvements have been effected of late years in the Neapolitan tariff. But the government, ignorant and bigoted, has every vice by which a worn out and effete tyrannical system is characterised. And till it be overthrown, and something more liberal and intelligent established in its stead, it would be idle to expect any material change for the better.

Our imports from Naples consist of olive oil, brimstone, silk, cream of tartar, lemon juice, wine (mostly marsala from Sicily), madder, shumac, liquorice juice and paste, argol, and a variety of other articles.

Shipping, Port Charges, &c.—The charges of a public nature on a *national ship* of 300 tons burden entering and clearing out from the port of Naples, are as under:—

	D. gr.
On entering—For expediting (Equal to 5*s.* 8*d.* sterling.)	1 60
On clearing out—Expediting	1 60
Bill of health	1 20
Tonnage duty at 4 grains per ton	12 0
(Equal to about 2*l.* 9*s.* 4*d.* sterling.)	D. 14 80

Charges on a *foreign ship* of 300 tons burden:—

On entering—Visa	0 55
Expediting	6 60
Stamp	0 14
(Equal to about 1*l.* 4*s.* 4*d.* sterling.)	D. 7 29
On clearing out—Passport	1 0
Expediting	6 60
Stamp	0 14
Bill of health	2 40
Police	0 20
Port officers	0 60
Registering papers	0 20
Tonnage duty at 40 grains per ton	120 0
(Equal to about 21*l.* 17*s.* 2*d.* sterling.)	D. 151 14

Custom-house Regulations.—Masters of merchantmen are bound, within 24 hours of their arrival, to furnish the custom-house with a general manifest of their cargoes, provisions, and stores; and the master, when consignee, or the consignees, are bound, within 48 hours after the arrival of the ship, to send in a declaration or manifest in detail, of all goods on board. Should the consignee omit to render the manifest in detail within 48 hours, they are subjected to a fine of 30 per cent. upon the non-specified articles.

This declaration or manifest cannot be corrected after the 48 hours are elapsed; and the master or consignee is liable to a fine of 50 ducats for every package erroneously declared. This, however, is usually remitted, unless there be suspicion of fraud, upon application to the director-general of the customs. The importation of gunpowder, tobacco, and salt, though they may be for the ship's use, is strictly prohibited. When such articles are on board the exact quantity of each on hand must be specified in the manifest; and on the vessel receiving *pratique* they are taken to the custom-house, and kept till her departure, when they are restored to her. The slightest deviation from the rules with respect to these articles subjects them, and sometimes the vessel also, to confiscation, and the master to a heavy fine.

Quarantine Regulations.—The free admission, conditional reception, or absolute refusal of a vessel arriving at the port is determined by the wholesome or unwholesome character of the place from which she comes. The place may be, 1. Infected. 2. Suspicious. 3. Endangered. Or, 4. Secure. In the first case, the vessel is *refused altogether*; in the 2d, she is admitted on a long quarantine; in the 3d, she is received on a short quarantine; in the 4th, she is allowed free *pratique*. If the vessel be a ship of war, her quarantine is performed in the Bay of Naples; the days of her passage being allowed in the calculation: if a merchantman, quarantine is performed at Nisita, an island about 6 miles from Naples. It commences from the day of her arrival, if in ballast, or loaded with unsusceptible merchandise; if otherwise, from the day of the discharge of her cargo. Vessels from Great Britain or the N. of Europe are subject to a quarantine of 8 days; but if they touch by the way at any port in Spain or Barbary, the quarantine is lengthened to 14 days: provided, however, they have clean bills of health they may wholly avoid the quarantine by touching at some Italian port, or at Malta, the latter being in free *pratique* with Naples. Vessels from the Ionian Islands are subject to a quarantine of 20 days. No foul lazaretto exists at Naples; but at Nisita there is a lazaretto of expurgation for vessels from suspicious or endangered districts or territories. Vessels from infected places usually go to Leghorn or Genoa, where they may unload in a *lazaretto sporco*. The fees charged on ships performing quarantine are heavy. No distinction is made between national and foreign bottoms.

Brokers, Commission, &c.—No person can legally act as a broker unless authorised by government. All patented brokers are obliged, by way of security, to hold funded property producing 500 ducats of "rente," or a dividend of 85*l.* 6*s.* 8*d.* sterling. Many persons, however, act as brokers without being *patented*, but no contract made by them is admitted in a court of law. Any person may set up as a merchant, by giving due notice to the *Camera di Commercio*.

Rates of Commission and Charges established by the Merchants at Naples.

Commission on sales of fish	3 per cent.
Do. on manufactures of all kinds	3 —
Do. on all other goods	2 —
Do. on goods purchased	2 —
Do. on receiving and forwarding	½ —
Do. on attempting sales	1 —
Do. on re-sale of goods for the same account on which a purchasing commission has been charged	1½ —
Do. on chartering vessels, or procuring charters	3 —
Do. on collecting freights on chartered ships	2 —
Do. on ships both inwards and outwards	4 —
Do. on advances on letters of credit	1 —
Do. on effecting insurances	½ —
Do. on negotiating bills	½ —
Do. on receiving and paying or remitting	½ —
Del credere on sales	2 —
Do. on purchase of oil, not exceeding 3 months	1 —
Do. do. do., not exceeding 6 do.	2 —
Do. per underwriters	½ —

Tares usually allowed by the custom house at Naples on the leading articles of importation :—

Sugar in hogsheads	12 per cent.
Do. in boxes or barrels	14 —
Do. in Brazil chests	18 to 20 per cent.
Do. in bags	6 rottoli.
Loaves, in casks	real tare.
Do. extra for paper and strings	5 per cent.
Indigo	real tare.
Tin, in barrels, each	1½ rottoli.
Alum, in casks	10 per cent.
Wax, real tare and extra	2 to 3 per cent.
Cod and stock-fish	1 per cent.
Coffee, in casks	real tare.
Do. in bags, each	3 rottoli.
Pepper, do.	—
Pimento, do.	—
Cocoa, do.	3 do. 2 ad. 5 per cent.
Cocoa, in casks	for dust, real tare.
Cassia lignea, cochineal, and bark	real tare.

Insurance.—There are 4 or 5 companies for the insurance of ships, and 1 for lives. Their terms are generally higher than those of similar establishments in London. Houses are never insured at Naples, their construction rendering fires very rare. The companies are established by royal authority, the shareholders being only liable for the amount of their shares.

Banking.—The principal merchants of Naples are all, more or less, bankers, inasmuch as they advance money on letters of credit, and deal in foreign exchanges, and other financial operations. But the only banking establishment at present in existence is the Bank of the Two Sicilies, founded by government, and guaranteed by the possession of landed property. It is not a bank for the issue of notes on credit, like the Bank of England, but for their issue on deposits, somewhat on the principle of the Bank of Hamburg. Government makes all its payments by means of notes or orders on the bank; and they are issued to individuals for whatever sums they desire, on their paying an equivalent sum of money to the bank. These notes or orders form a considerable part of the circulating medium of Naples; they are paid in cash on demand.

Government has also established a discount office, where bills, indorsed by 2 persons of good credit, and not at more than 3 months' date, are discounted at 4 per cent.

So large a city as Naples, and so advantageously situated for the commerce with the Black Sea, the Levant, Greece, Spain, Northern Italy, Northern Africa, &c., would, had it been allowed to avail itself of its natural advantages, have become a most important *entrepôt*. But in consequence of injudicious regulations no goods have been carried to it except those destined for home consumption. In this respect, however, a considerable change may now be anticipated.

Credit, &c.—Goods are universally sold at long credits, mostly from 4 to 8 months; and for manufactured goods, sometimes longer. On sales of indigo, from 12 to 18 months' credit is given. Discount for ready money is at the rate of 6 per cent. per annum. Merchants are arranged by the Chamber of Commerce into 5 different classes; and a 6 months' credit is given at the custom-house for duties, to the extent of 60,000, 40,000, 30,000, 20,000, and 15,000 ducats, to individuals, according to the class in which they happen to be enrolled. But this is of little importance. Unless the transactions of a merchant be very limited indeed, the duties he has to pay amount to much more than the credit he is allowed.

NAVAL COURTS, are tribunals established as occasion may require, either on the high seas or in foreign parts, for inquiring into and dealing with various matters pertaining to maritime affairs. They were originally constituted by the 13 & 14 Vict. c. 93; but their constitution, duties, and procedure are now regulated by the clauses relating thereto in the Mercantile Shipping Act of 1854, the 17 & 18 Vict. c. 104, which are as follows, viz. :—

Naval Courts may be summoned for hearing Complaints, &c. — Any officer in command of any ship of H. M. on any foreign station, or, in the absence of such officer, any consular officer, may summon a Court, to be termed a "Naval Court," in the following cases, viz.,

(1.) Whenever a complaint which appears to such officer to require immediate investigation is made to him by the master of any British ship, or by any certificated mate, or by one or more of the seamen belonging to any such ship.

(2.) Whenever the interest of the owner of any British ship or of the cargo of any such ship appears to such officer to require it.

(3.) Whenever any British ship is wrecked or abandoned or otherwise lost at or near the place where such officer may be, or whenever the crew or part of the crew of any British ship which has been wrecked, abandoned, or lost abroad, arrives at such place.—§ 260.

Constitution of such Courts. — Every such naval court as aforesaid shall consist of not more than 5 and not less than 3 members, of whom, if possible, one shall be an officer in the naval service of H. M. not below the rank of lieutenant, one a consular officer, and one a master of a British merchant ship, and the rest shall be either officers in the naval service of H. M., masters of British merchant ships, or British merchants; and such court may include the naval or consular officer summoning the same, but shall not include the master or consignee of the ship to which the parties complaining or complained against may belong; and the naval or consular officer in such court, if there is only one such officer in the court, or, if there is more than one, the naval or consular officer who, according to any regulations for settling their respective ranks for the time being in force, is of the highest rank, shall be the president of such court.—§ 261.

General Functions and Mode of Action of such Court. — Every such naval court shall hear and investigate the complaint brought before it, or the cause of the wreck or abandonment, (as the case may be,) and may for that purpose summon and compel the attendance of parties and witnesses, and administer oaths, and order the production of documents, and shall conduct the investigation in such manner as to give any person against whom any charge is made an opportunity of making a defence.—§ 262.

Powers of such Courts. — Every such naval court may, after hearing the case, exercise the following powers, viz.,

(1.) It may, if unanimous that the safety of the ship or crew, or the interest of the owner, absolutely requires it, supersede the master, and may appoint another person to act in his stead; but no such appointment shall be made without the consent of the consignee of the ship, if then at the place.

(2.) It may discharge any seaman from his ship.

(3.) It may order the wages of any seaman so discharged or any part of such wages to be forfeited, and may direct the same either to be retained by way of compensation to the owner, or to be paid into the receipt of H. M.'s exchequer in the same manner as other penalties and forfeitures under this act.

(4.) It may decide any questions as to wages, or fines, or forfeitures, arising between any of the parties to the proceedings.

(5.) It may direct that all or any of the costs incurred by the master or owner of any ship in procuring the imprisonment of any seaman or apprentice in a foreign port, or in his maintenance whilst so imprisoned, shall be paid out of and deducted from the wages of such seaman or apprentice, whether then or subsequently earned.

(6.) It may exercise the same powers with regard to persons charged before it with the commission of offences at sea or abroad as are by this act given to British consular officers.

(7.) It may order the cost of the proceeding before it (if any), or any portion thereof, to be paid by any of the parties thereto, and may order any person making a frivolous or vexatious complaint to pay compensation for any loss or delay caused thereby; and any cost or compensation so ordered shall be paid by such person accordingly, and may be recovered in the same manner in which the wages of seamen are recoverable, or may, if the case admits, be deducted from his wages.

And all orders duly made by any such court under the powers hereby given to it shall in any subsequent legal proceedings be deemed conclusive as to the rights of the parties. —§ 263.

Orders to be entered in Official Log.—All orders made by any such naval court shall, whenever practicable, be entered in the official log book of the ship to which the parties to the proceedings before it belong, and shall be signed by the president of the court.—§ 264.

Report to be made of Proceedings of Naval Courts.—Every such naval court shall make a report to the B. of Trade, containing the following particulars, viz. :

(1.) A statement of the proceedings, with the order made by the court, and a report of the evidence.

(2.) An account of the wages of any seaman or apprentice who is discharged from his ship by such court.

(3.) If summoned in order to inquire into a case of wreck or abandonment, a statement of the opinion of the court as to the cause of such wreck or abandonment, with such remarks on the conduct of the master and crew as the circumstances require.

And every such report shall be signed by the president of the court; and every document purporting

to be such a report and to be so signed as aforesaid shall, if produced out of the custody of some officer of the B. of Trade, be deemed to be such report, unless the contrary is proved, and shall be received in evidence, subject to all just exceptions. — § 265.

Penalty for preventing Complaint, &c.—Any person who wilfully and without due cause prevents or obstructs the making of any such complaint as last aforesaid, or the conduct of any case or investigation by any naval court, shall for each such offence incur a penalty not exceeding 50*l.*, or be liable to imprisonment with or without hard labour for any period not exceeding 12 weeks. — § 266.

NAVIGATION LAWS. These laws form an important branch of Maritime Law. In this country they are understood to comprise the various acts that have been passed, defining British ships, the way in which such ships are to be registered, the peculiar privileges enjoyed by them, and the conditions under which foreign ships shall be allowed to engage in the trade of the country, either as importers or exporters of commodities, or as carriers of commodities from one part of the country to another.

Sketch of the History and Principles of the Navigation Laws. — The origin of the Navigation Laws of England may be traced to the reign of Richard II., or perhaps to a still more remote period. But, as no intelligible account of the varying and contradictory enactments framed at so distant an epoch could be compressed within any reasonable space, it is sufficient to observe, that, in the reign of Henry VII., two of the leading principles of the navigation law were distinctly recognised, in the prohibition of the importation of certain commodities, unless imported in ships belonging to English owners, and manned by English seamen. In the early part of the reign of Elizabeth (*5 Eliz. c. 5.*), foreign ships were excluded from our fisheries and coasting trade. The republican parliament gave a great extension to the navigation laws, by the act of 1650, which prohibited all ships, of all foreign nations whatever, from trading with the plantations in America, without having previously obtained a licence. These acts were, however, rather intended to regulate the trade between the different ports and dependencies of the empire, than to regulate our intercourse with foreigners. But in the following year (9th of October, 1651) the republican parliament passed the famous *Act of Navigation.* This act had a double object. It was intended not only to promote our own navigation, but also to strike a decisive blow at the naval power of the Dutch, who then engrossed almost the whole *carrying trade* of the world, and against whom various circumstances had conspired to incense the English. The act in question declared, that no goods or commodities whatever, of the growth, production, or manufacture of Asia, Africa, or America, should be imported either into England or Ireland, or any of the plantations, except in ships belonging to English subjects, and of which the master and the greater number of the crew were also English. Having thus secured the import trade of Asia, Africa, and America, to the English ship owners, the act went on to secure to them, as far as that was possible, the import trade of Europe. For this purpose, it further enacted, that no goods of the growth, production, or manufacture of any country in Europe, should be imported into Great Britain, except in British ships, or *in such ships as were the real property of the people of the country or place in which the goods were produced, or from which they could only be, or most usually were, exported.* The latter part of the clause was entirely levelled against the Dutch, who had but little native produce to export, and whose ships were principally employed in carrying the produce of other countries to foreign markets. Such were the leading provisions of this famous act. They were adopted by the regal government which succeeded Cromwell, and form the basis of the act of the 12th Car. 2. c. 18., which continued, to a very recent period, to be the rule by which our naval intercourse with other countries was mainly regulated; and has been pompously designated the *Charta Maritima* of England!

In the statute 12 Car. 2. c. 18., the clause against importing foreign commodities, except in British ships, or in ships belonging to the country or place where the goods were produced, or from which they were exported, was so far modified, that the prohibition was made to apply only to the goods of Russia and Turkey, and to certain articles since well known in commerce by the name of *enumerated* articles, leave being at the same time given to import all other articles in ships of any description. But this modification was of very little importance; inasmuch as the enumerated articles comprised all those that were of most importance in commerce, as timber, grain, tar, hemp and flax, potash, wines, spirits, sugar, &c. Parliament seems, however, to have very speedily come round to the opinion that too much had been done in the way of relaxation; and in the 14th of Charles II. a supplemental statute was passed, avowedly with the intention of obviating some evasions of the statute of the preceding year, which it was affirmed had been practised by the Hollanders and Germans. This, however, seems to have been a mere pretence, to excuse the desire to follow up the blow aimed, by the former statute, at the carrying trade of Holland. And such was our jealousy of the naval and commercial greatness of the Dutch, that, in order to cripple it, we did not hesitate totally to proscribe all trade with them; and to prevent the possibility of fraud, or of clandestine or indirect intercourse with Holland, we went so far as to include the commerce with the Netherlands and Germany in the same proscription. The statute of the 14th Car. 2. prohibited all importation from these countries of a long list of enumerated commodities

under any circumstances, or in any vessels, whether British or foreign, under the penalty of seizure and confiscation of the ships and goods. So far as it depended on us, Holland, the Netherlands, and Germany were virtually placed without the pale of the commercial world! And though the extreme rigour of this statute was subsequently modified, its principal provisions remained in full force until the late alterations.

The policy, if not the motives, which dictated these statutes, has met with very general eulogy. It has been said, and by no less an authority than Dr. Smith, that national animosity did, in this instance, that which the most deliberate wisdom would have recommended. "When the act of navigation was made," says he, "though England and Holland were not actually at war, the most violent animosity subsisted between the two nations. It had begun during the government of the long parliament, which first framed this act, and it broke out soon after in the Dutch wars during that of the Protector and of Charles II. It is not impossible, therefore, that some of the regulations of this famous act may have proceeded from national animosity. They are as wise, however, as if they had all been dictated by the most deliberate wisdom. National animosity at that particular time aimed at the very same object which the most deliberate wisdom would have recommended,—the diminution of the naval power of Holland, the only naval power which could endanger the security of England. The act of navigation *is not favourable to foreign commerce, or to the growth of that opulence which can arise from it.* The interest of a nation in its commercial relations to foreign nations is, like that of a merchant with regard to the different people with whom he deals, to buy as cheap and to sell as dear as possible. But the act of navigation, by diminishing the number of sellers, must necessarily diminish that of buyers; and we are thus likely not only to buy foreign goods dearer, but to sell our own cheaper, than if there was a more perfect freedom of trade. As defence, however, is of much more importance than opulence, the act of navigation is, perhaps, the wisest of all the commercial regulations of England."—(*Smith's Wealth of Nations*, p. 204.)

It may, however, be very fairly doubted, whether, in point of fact, the navigation law had the effects here ascribed to it, of weakening the naval power of the Dutch, and of increasing that of this kingdom. The Dutch were very powerful at sea for a long period after the passing of this act; and it seems natural to conclude, that the decline of their maritime preponderance was owing rather to the gradual increase of commerce and navigation in other countries, and to the disasters and burdens occasioned by the ruinous contests the Republic had to sustain with Cromwell, Charles II., and Louis XIV., than to the mere exclusion of their merchant vessels from the ports of England. It is not meant to say that this exclusion was altogether without effect. The efforts of the Dutch to procure a repeal of the English navigation law show that, in their apprehension, it operated injuriously on their commerce.* It is certain, however, that its influence in this respect has been greatly over-rated in this country. *Excessive taxation*, and not our navigation law, was the principal cause of the fall of profits, and of the decline of manufactures, commerce, and navigation, in Holland. "Les guerres," says the well-informed author of the *Commerce de la Hollande*, "terminées par les traités de Nimegue, de Ryswick, d'Utrecht, et enfin la dernière par le traité d'Aix-la-Chapelle, ont successivement obligé la République de faire usage d'un grand crédit, et de faire des emprunts énormes pour en soutenir les fraix. Les dettes ont surchargé l'état d'une somme immense d'intérêts, qui ne pouvoient être payés que par *une augmentation excessive d'impôts*, dont il a fallu faire porter la plus forte partie par les consommations dans un pays qui n'a qu'un territoire extrêmement borné, et par conséquent par l'industrie. Il a donc fallu faire enchérir infiniment la main-d'œuvre. Cette cherté de la main-d'œuvre a non seulement restreint presque toute sorte de fabrique et d'industrie à la consommation intérieure, mais elle a encore porté un coup bien sensible au commerce de frêt, partie accessoire et la plus précieuse du commerce d'economie: car cette cherté a rendu la construction plus chere, et augmenté le prix de tous les ouvrages qui tiennent à la navigation, même de tous les ouvrages des ports et des magasins. Il n'étoit pas possible que l'augmentation du prix de la main-d'œuvre ne donnât, malgré tous les efforts de l'économie Hollandoise, un avantage sensible aux autres nations qui voudroient se livrer au commerce d'économie et à celui de frêt."—(Tome ii. p. 211.)

This extract, which might, were it necessary, be corroborated by others to the same effect from all the best Dutch writers, show that it is not to our navigation laws, nor to the restrictive legislations of other foreign powers, but to the abuse of the funding system, and the excess of taxation, that the decline of the commercial greatness and maritime power of Holland was really owing. Neither does it appear that the opinion maintained by Dr. Smith and others, that the navigation law had a powerful influence in augmenting the naval power of this country, rests on any better foundation. The

* In the treaty of Breda, agreed upon in 1667, between the States General and Charles II., the latter undertook to procure the repeal of the navigation law. But the subject was never agitated in either house of parliament.

taste of the nation for naval enterprise had been awakened, the navy had become exceedingly formidable, and Blake had achieved his victories, before the enactment of this famous law. So far, indeed, is it from being certain that the Navigation Act had, in this respect, the effect commonly ascribed to it, that there are good grounds for thinking it had a precisely opposite effect, and that it operated rather to diminish than to increase our mercantile navy. It is stated in Roger Coke's *Treatise on Trade*, published in 1671 (p. 36.), that this act, by lessening the resort of strangers to our ports, had a most injurious effect on our commerce; and he further states that we had lost, within 2 years of the passing of the act of 1650, the greater part of the Baltic and Greenland trades.—(p. 48.) Sir Josiah Child, whose treatise was published in 1691, corroborates Coke's statement; for while he decidedly approves of the navigation law, he admits that the English shipping employed in the Eastland and Baltic trades had decreased at least *two thirds* since its enactment, and that the foreign shipping employed in these trades had proportionally increased.—(*Treatise on Trade*, p. 89. Glasg. edit.) Exclusively of these contemporary authorities, it may be worth while to mention that Mr. Richardson, an extensive and extremely well-informed merchant, condemns the whole principle of the Navigation Act; and contends, that instead of increasing our shipping and seamen, it had diminished them both; and that, by rendering the freight of ships higher than it would otherwise have been, it had entailed a heavy burden on the public, and been one of the main causes that had prevented our carrying on the fishery so successfully as the Dutch.—(*Essay on the Causes of the Decline of Foreign Trade*, p. 60. ed. 1756.)

There do not seem to be any very good grounds on which to question these statements; and they are at all events sufficient to show, that the assertions of those who contend that the navigation laws had a prodigious effect in increasing the number of our ships and sailors, must be received with very great modification. But suppose that all that has been said by the apologists of these laws were true to the letter; suppose it were conceded, that, when first framed, the Act of Navigation was extremely politic and proper; that would afford but a very slender presumption in favour of the policy of supporting it in the present day. Human institutions are not made for immortality: they must be accommodated to the varying circumstances and exigencies of society. But the situation of G. Britain and the other countries of Europe has totally changed since 1650. The envied wealth and commercial greatness of Holland have passed away: we have no longer any thing to fear from her hostility: and "he must be, indeed, strangely influenced by antiquated prejudices and by-gone apprehensions, who can entertain any of that jealousy from which the severity of this law principally originated." London has become, what Amsterdam formerly was, the grand emporium of the commercial world —*universi orbis terrarum emporium:* and the real question which now presents itself for our consideration is, not what are the best means by which we may rise to naval greatness? but—what are the best means of preserving that undisputed pre-eminence in maritime affairs to which we have attained?

Now, it does not really seem that there can be much difficulty in deciding this question. Navigation and naval power are the children, not the parents — the effect, not the cause — of commerce. If the latter be increased, the increase of the former will follow as a matter of course. More ships and more sailors become necessary according as the commerce between different and distant countries is extended. A country in the condition of G. Britain in the reign of Charles II., when her shipping was comparatively limited, might perhaps be warranted in endeavouring to increase its amount, by excluding foreign ships from her harbours. But it is almost superfluous to add, that it is not by any such regulations, but solely by the aid of a flourishing and widely extended commerce, that the immense mercantile navy we have now accumulated can be supported.

It may be easily shown, that to have continued, in the present state of the world, to enforce the provisions of the old navigation law, would have been among the most efficient means that could have been devised for the destruction of our commerce. The wealth and power to which Britain has attained, have inspired other nations with the same feelings of envy and jealousy, that the wealth of Holland formerly generated in our minds. Instead of ascribing our commercial and manufacturing superiority to its true causes, that is, to the comparative freedom of our constitution, the absence of all oppressive feudal privileges, the security of property, and the fairness of our system of taxation, our foreign rivals contended that it had been entirely owing to our exclusive system, and appealed to our example to stimulate their respective governments to adopt retaliatory measures, and to protect them against British competition. These representations had the most injurious operation. In 1817, the American legislature passed an act, copied to the very letter from our statute book, with the avowed intention of its operating as a retaliatory measure against this country. The northern powers threatened to act on the same principle; and would have carried their threats into effect but

for timely concessions on our part. The same engines by which we laboured to destroy the trade of Holland were thus about to be brought, by what we could not have called an unjust retribution, to operate against ourselves. Nor can there be a doubt that, had we continued to maintain our exclusive system, and refused to set a better example to others, and to teach them the advantage of recurring to more liberal principles, we should have run a very great risk of falling a victim to the vindictive spirit which such short-sighted and selfish policy would have generated.

These statements are sufficient to show that a considerable relaxation of our navigation laws had become indispensable; and this was partly effected in 1821 and 1825, but principally in the latter, by the measures introduced with that view into parliament by Mr. Wallace (afterwards Lord Wallace) and Mr. Huskisson. The effect of these was to place the intercourse of all European countries at amity with the U. Kingdom on the same footing. The memorials of our former animosity, and of our jealousy of the prosperity of certain neighbouring states, being thus abolished, the same law has since continued to regulate our commerce with the continent. This uniformity, besides giving greater scope to mercantile operations, and facilitating our traffic with some of our most opulent neighbours, removed a prolific source of embarrassment and litigation, at the same time that it detracted considerably from that selfish character which had been believed on the continent, and not without considerable reason, to be the animating principle of our commercial policy.

The changes that were also made in 1821 and 1825, in regard to the importation of *enumerated* goods*, and of articles, the produce of Asia, Africa, and America, though of considerable importance, were very far from obviating the hardships arising out of the previous rules. The importation of European goods continued to be practicable only in British ships, or in ships of the country of which the goods were the produce, or of the country from which they were shipped. This regulation was kept up to hinder the Dutch, the Danes, or any other people, from becoming the carriers of the produce of other nations to our ports. But while this result was not very likely to occur, the rule imposed a serious hardship on foreigners, and also on ourselves. Suppose that a Dutch ship took in part of a cargo of Dutch produce, such as cheese, butter, and geneva at Rotterdam for England, what could be more vexatious, in the event of her not being able to complete her cargo with Dutch goods suitable for our markets, than to hinder her from making it up with the foreign goods suitable for them warehoused at Rotterdam, such as the wines and brandies of France, the corn of Poland, the hemp and tallow of Russia, &c.? But its vexatious character was not the only thing to be objected to in a regulation of this sort. It really increased the cost of the butter, cheese, &c. sent to us; for as these had to bear the whole charge on account of freight which, but for the regulation, would have been in part borne by other articles, their price was proportionally enhanced, at the same time that the Dutch were tempted to resort to retaliatory measures. And how injurious soever in other respects, it is sufficiently plain that this regulation could never, as has been alleged, occasion an increased demand for British shipping. It no doubt compelled the foreigners to sort their cargoes less advantageously than they might otherwise have done. But the burden of this fell upon the employers of the carriers and not on the carriers themselves; that is, it fell upon us and not on the foreigners; while, in the event of their retaliating, our trade was subjected to the same difficulties. It is visionary to pretend that a system so prejudicial to commerce could be advantageous to shipping and navigation.

The measures introduced in 1825 left also untouched the regulation by which goods, the produce of Asia, Africa, and America, were prohibited from being imported from any European port †, and could not be imported on foreign bottoms, except when they were imported direct in ships of the country of which the goods were the produce. It was proposed in 1821 to authorise British ships to import all non-prohibited articles from wherever they might find them; and though nothing apparently could be more reasonable than such a regulation, it was objected to on the pretence that foreign ships being more cheaply navigated than ours, would take advantage of this circumstance to import Asiatic, African, and American products into the contiguous continental ports, and would thus confine the employment of our ships to their carriage thence! And upon this futile pretence, for which there was not so much as the shadow of a foundation in fact, the old rule was maintained; and, in consequence, though the ports along the English Channel might have been glutted with the corn and cotton of America, the sugar of Brazil and Cuba, the coffee of Java, and the tea of China, and though all or some of these articles might at the time have been deficient here, not one of them could be imported in a foreign ship, unless, as was sometimes the case, it were carried back to the country whence it had been originally shipped, nor even in a British ship, unless it were

* These changes are specified in the former editions of this work.

† The only exception to this rule were articles from Asiatic and African Turkey imported from the Levant, and bullion.

first carried from Europe to some other continent! It is hardly possible to imagine any rule or regulation more extravagantly oppressive and absurd, and it is really astonishing that it should have been able to keep its place on the statute book for about two centuries. Luckily, however, this preposterous system, as well as the regulations affecting importation from Europe, ceased on the 1st of January, 1850. The act for their repeal, the 12th and 13th Vict. c. 29., went far to complete the free trade measures adopted in 1842 and 1846, and had the most favourable influence over the commerce and navigation of the empire.

It did not, however, interfere with the monopoly of the coasting trade, which continued to be secured to British ships. But this last shred of the protective system has, also, been swept away by the act of 1854, the 17th Vict. c. 5 (see COASTING TRADE). Probably, however, few foreign ships will engage in this department; but their being at liberty to do so will insure freights being kept at their fair level.

The relaxations made in 1825 and 1826 in the regulations embodied in our old navigation laws in regard to the colonial trade, were perhaps the most valuable portion of the changes introduced by Mr. Huskisson. But though they did much to obviate the hardships growing out of the previous rules, and to give freedom to the colonial trade, they did not entirely effect that object; and some regulations were subsequently continued in force which, though irritating and mischievous in their bearing on the colonies, were of no real advantage to ourselves. These, however, wholly ceased on the 1st of January, 1850. All varieties of goods may now be imported into the colonies from all countries at peace with Great Britain, and exported from the colonies to them, whether in British, colonial, or foreign shipping. The complaints of the colonists, in regard to the injuries they have sustained from the rules enforced by our navigation laws, are thus completely obviated, and on that ground, at all events, they have no further claim to prohibitory duties.

Besides the restrictive regulations already alluded to, it was a part of our former policy to encourage the employment of British shipping by imposing higher duties on commodities imported in foreign vessels than were imposed on them when imported in British vessels; and it was also customary to charge foreign vessels with higher port and lighthouse duties, &c. This practice was always loudly complained of by foreigners; but we had little difficulty in maintaining it, so long as we could afford to disregard the retaliatory measures of other powers. But the extraordinary increase that took place, since the commencement of the late war, in our manufactures for foreign consumption, and the necessity under which we were, in consequence, placed, of conciliating our customers abroad, led to the adoption of the *reciprocity system*. The latter was first introduced into the trade with the U. States. After the N. American colonies had succeeded in establishing their independence, they set about framing rules for their navigation on the model of those of this country. Among other regulations of a restrictive character, it was enacted that all foreign vessels trading to the U. States should pay 44 cents, which was afterwards raised to 94 cents (nearly a dollar), per ton duty, beyond what was paid by American ships; and farther, that goods imported in foreign vessels should pay a duty of 10 per cent. over and above the duty payable on them when imported in American vessels.

This law was avowedly directed against the shipping of this country, though, as it was bottomed on the same principles as our navigation laws, we could not openly complain of its operation. Under these circumstances it would have been sound policy to have at once proposed an accommodation; and, instead of attempting to meet retaliation by retaliation, to have offered to modify our navigation law in so far as American shipping was concerned, on the Americans making reciprocal modifications in our favour. A different course was, however, followed. Various devices were fallen upon to counteract the navigation system of the Americans, without in any degree relaxing our own: but they all failed of their object; and at length it became obvious to every one that we had engaged in an unequal struggle, and that the real effect of our policy was, to give a bounty on the importation of the manufactured goods of other countries into the U. States, and thus gradually to exclude both our manufactures and ships from the ports of the republic. In consequence, a conviction of the necessity of making concessions gained ground progressively; and it was ultimately fixed, by the commercial treaty agreed upon between G. Britain and the U. States, in 1815, that in future equal charges should be imposed on the ships of either country in the ports of the other, and that equal duties should be laid upon all articles, the produce of the one country imported into the other, whether such importation were effected in the ships of the one or the other.

Brazil and the other states of S. America were naturally anxious to establish a commercial marine; and, to forward their views in this respect, they contemplated enacting navigation laws. But this intention was frustrated by the interference of the British

government, who, without stipulating for any particular advantage, wisely offered to admit their ships into our ports on a principle of reciprocity, or on their paying the same charges as our own ships, on condition of their admitting British ships into their ports on a similar footing. Commercial treaties, framed on this sound principle, were afterwards entered into with most of these states.

The reciprocity system having been thus adopted as the basis of the intercourse with the U. States, whose commercial marine was second only to that of G. Britain, it was not possible to refuse adopting it in the case of such European countries as might choose to admit our ships into their ports on a footing of equality.* The first demand of this sort was made on the part of the Prussian government, which on the 20th of June, 1822, issued an order in council, making large additions to the port dues previously charged on all ships belonging to those nations which did not admit Prussian ships on a principle of reciprocity. The real object of this order was to injure the navigation of this country; and it was speedily found that it had the desired effect, and that its operation on British shipping was most mischievous.

Under these circumstances, the British merchants and shipowners applied to our government for relief.

"We were assailed," said Mr. Huskisson, "with representations from all quarters connected with the shipping and trade of the country, against the heavy charges imposed upon British ships in the ports of Prussia. In such circumstances, what course did his Majesty's government take? We felt it to be our duty, in the first instance, to communicate with the Prussian minister in this country; and our minister at Berlin was, I believe, also directed to confer with the Prussian government on the subject. I myself had a conference with the Prussian minister at this court, and I well recollect the substance of his reply to me: 'You have,' he said, 'set us the example, by your port and light charges, and your discriminating duties on Prussian ships; and we have not gone beyond the limits of that example. Hitherto, we have confined the increase of our port and tonnage charges to ships only; but it is the intention of my government next year' (and of this he showed me the written proof) 'to imitate you still more closely, by imposing discriminating duties on the goods imported in your ships. Our object is a just protection to our own navigation; and so long as the measure of our protection does not exceed that which is afforded in your ports to British ships, we cannot see with what reason you can complain.'

"Against such a reply what remonstrance could we, in fairness, make to the Prussian government? We might have addressed ourselves, it may be said by some, to the friendly feelings of that government; — we might have pleaded long usage in support of our discriminating duties; — we might have urged the advantages which Prussia derived from her trade with England. Appeals like these were not forgotten in the discussion, but they were of little avail against the fact stated by the consul at Dantzic — that 'the Prussian shipowners were all going to ruin.'

"By others it may be said, 'Your duty was to retaliate by increasing your own port charges and discriminating duties, on Prussian shipping.' I have already stated generally my reasons against the policy of this latter course. We were not prepared to begin a system of commercial hostility, which, if followed up on both sides to its legitimate consequences, could only tend to reciprocal prohibition. In this state of things, more prudently, as I contend, we entered upon an amicable negotiation with the Prussian government, upon the principle of our treaty with the United States, — that of abolishing, on both sides, all discriminating duties on the ships and goods of the respective countries in the ports of the other.

"Having concluded an arrangement with Prussia upon this basis, we soon found it necessary to do the same with some other of the northern states. Similar conventions were accordingly entered into with Denmark and Sweden. Reciprocity is the foundation of all those conventions; but it is only fair to add, that they contain other stipulations for giving facility to trade, and from which the commerce of this country, I am confident, will, in the result, derive considerable advantage." †

This statement shows that the establishment of the reciprocity system, with respect to which so violent a clamour was afterwards raised, was not a measure of choice but of necessity. We could not afford to hazard the exclusion of our manufactures from countries into which they were annually imported to a large amount. So long as the Prussians, Swedes, Danes, and other nations, chose to submit, without attempting to retaliate, to our system of discriminating duties on foreign ships, and on the goods imported in them, it was no business of ours to tell them that that system was illiberal and unjust. But when they discovered that such was really the case, and declared that unless we modified our restrictions, they would retaliate on our commerce, and either entirely exclude our commodities from their markets, or load those that were imported in British ships with prohibitory duties, should we have been justified in refusing to come to an accommodation? Were we to sacrifice the substance to the shadow? To turn away some of our best customers because they chose to stipulate that the intercourse between them and us should be conducted either in their ships or in ours, as the merchants might think best? Government had only a choice of difficulties; and they wisely preferred adopting a system which has preserved the access to foreign markets for English goods, and has farther secured an equal chance to English ships, with those of foreigners, of being employed in the trade with other countries. More could not have been obtained; nor would it have been really desirable. Had we endeavoured to enforce in the nineteenth century the rules and regulations that had been justly objected to and regarded as oppressive in the sixteenth and seventeenth centuries, we should have provoked a spirit of hostility and retaliation that must even-

* By the fourth section of the act 6 Geo. 4. c. 1., it was enacted, that his Majesty might, by an order in council, admit the ships of foreign states into our ports, on payment of the like duties that are charged on British vessels, provided that British ships are admitted into the ports of such foreign states on payment of the like duties that are charged on their vessels.

† Huskisson's Speech, May 12, 1826, on the State of the Shipping Interest.

tually, and at no distant period, have crippled alike the manufactures, the trade, and the navigation of the empire.

The reciprocity system is still wisely maintained, and is, indeed, embodied in the act 12 & 13 Vict. c. 29. But we do not make its previously agreeing to this system a condition of a foreign country being entitled to participate in the advantages conferred by this act. Such preliminary arrangements would have occasioned much embarrassment and difficulty, and we, therefore, have contented ourselves with reserving power to her Majesty in council, in the event of her thinking it expedient to interfere, to impose such prohibitions, restrictions, and discriminating duties on the ships of any foreign power frequenting our ports, as may be required to countervail any peculiar prohibitions, restrictions, or duties laid upon British ships in the ports of such foreign power.

Much difference of opinion has existed as to the practical effect on our shipping and navigation, of the changes in the navigation law introduced by Mr. Huskisson. But there is really no ground for any such difference. This will be apparent from the following comparison between the shipping belonging to the empire in 1825, when Mr. Huskisson's reforms began, and in 1848:—

Account of the Ships, their Tonnage, and their Crews, belonging to the British Empire in 1825 and 1848.

Years.	United Kingdom and Possessions in Europe.		Colonies.		Total.		Crews.
	Ships.	Tons.	Ships.	Tons.	Ships.	Tons.	
1825	20,701	2,528,807	3,579	214,875	24,280	2,553,682	166,183
1848	25,638	3,400,809	8,034	651,351	33,672	4,052,160	256,069
Excess in 1848.	4,937	1,072,002	41,455	436,476	9,392	1,498,478	69,886

It is plain from this statement that the number of our ships, the amount of their tonnage, and the number of our sailors, have all been vastly increased since 1825. And if this be not, we should like to know what can be, a conclusive proof of the wisdom of the changes effected in 1825. They have, in fact, been successful to a degree which the most sanguine could not previously have supposed possible.

Although, however, the fact of a vast increase of our mercantile marine having taken place since 1825, be too well established to admit of any doubt, it is contended by the apologists of the old restrictive system, that the share which foreigners have in the trade of the U. K. is notwithstanding greater now than in 1825. But this greater preponderance of foreign vessels in our trade, if such really be the case (which is doubtful), is admitted to be but inconsiderable; though, were it incomparably greater than it is alleged to be, it would afford no room or ground for objecting to the measures of 1825 and 1849. The shipping and foreign trade of most continental states were all but wholly destroyed during the war terminated in 1815; while our shipping and trade were then proportionally increased: and the influence of this depression on the one side, and of the unnatural stimulus on the other, was far from being exhausted in 1825. But in the lengthened interval that has since elapsed, the mercantile navies of the continental states have attained to their ordinary state. And while we have no longer had any peculiar advantages on our side, we have had to contend with them, and with the rapidly increasing marine of the U. States. As respects the latter, we may observe, that while in 1825 our imports of cotton, principally from America, amounted to about 222,500,000 lbs., they amounted in 1854, to about 886,500,000 lbs.; at the same time that the imports of corn and flour from the U. States in the latter year bore a still greater proportion to their amount in the former. Our intercourse with Holland, France, the Elbe, &c., which was all but wholly suppressed during the war, is now become very extensive; and are we, under such circumstances, to be surprised that the proportion of foreign shipping frequenting our ports has increased? Had such increase been ten times greater, it could not have surprised any reasonable person; and the fair presumption is, that but for the reforms effected in 1835, such would have been the case. And experience has shown that the farther reforms effected in 1849, which, like those of 1825, were imperatively required by the exigencies of the case, have been equally beneficial.

It may be said, perhaps, that the rapid extension of our mercantile navy during the last 4 or 5 years, and the extraordinary rise of freights, and of the profits of the shipowners, is mainly a consequence of the gold discoveries in California and Australia, and of the prodigious impulse they have given to emigration and to the trade of the world. But, though the circumstances alluded to have undoubtedly had a very powerful influence, there is no room or ground for thinking that, under any circumstances, our shipowners should not be able to maintain a successful competition with those of America, or any other country. The wages of seamen in the U. States are usually

higher than here, which, indeed, is a principal cause of our sailors engaging so very extensively as they are known to do in the American service. But, in most respects, the ship-owners of the two countries are nearly on a level. The rapid increase of population in the U. States, the vast extent of their sea-coast, and the gigantic magnitude of the rivers and lakes by which the Union is intersected or bounded, by affording proportional means for the employment of shipping, will, there is little doubt, speedily render her commercial marine greater than that of this or any other nation. But there are no good grounds for supposing that in those departments which are equally open to the enterprise and ships of both nations, the British have anything to fear from the competition of the Americans. And they are the only people to whom, in a matter of this sort, it is necessary to allude.

Till very recently our shipping interest was subjected to sundry burdens and restrictions by which their energies were weighed down and fettered. These, however, are now either wholly abolished, or greatly modified. Formerly no ship could enjoy the peculiar privileges of a British ship, unless she were of the built of the U. Kingdom or of the colonies, and unless the master and 3-4ths of the crew were British subjects. But these restrictions have been repealed, the former by the 12 & 13 Vict. c. 29., and the latter by the 16 & 17 Vict. c. 131. In consequence of these judicious alterations, all the building yards and all the seamen of the world may be made subservient to the wants and the purposes of our merchants and shipowners. It is probable, indeed, from our superior facilities for the building of ships, especially those of iron, which are now being largely introduced, and from the comparative density of our population, that neither foreign ships* nor foreign seamen will be extensively introduced into our service. But the fact that they may be, and no doubt will be to some extent introduced, is of immense importance; and will do more than anything else to give new energy to our ship-builders, and to improve the conduct and discipline of our seamen. The insubordination and desertion of the latter, especially in foreign parts, have often been attended with ruinous results. Now, however, that their place may be supplied by any description of foreign sailors, it may be fairly presumed that there will be a material amendment in this respect. The sailors will find that they will consult their own no less than their employer's interest, by paying more attention than hitherto to their engagements, and by their good conduct, and ready obedience to the reasonable commands of their superiors.

In addition to these important reforms, others of a subordinate but still very valuable description have been, or are in the course of being effected. The incompetence and ignorance of the masters, which was a most serious evil, has already partly been, and eventually will be all but wholly obviated by the examination to which they are now obliged to submit, and by the better education which it renders necessary. (See MASTERS.) The oppressive charges and proceedings which were sometimes made and carried on by the officers of ships of war on account of salvage have, also, been a good deal modified, though, perhaps, they ought to be wholly abolished. The same may be said of the privilege, which has recently been regulated, enjoyed by ships of war of taking men from on board merchant ships on distant voyages. The charges for lights and pilotage have also been inquired into, and will, most likely, be speedily reduced, and placed on a less objectionable footing than at present. It is obvious, therefore, that a vast improvement has already been made, and that other changes for the better are in progress, in the situation of our mercantile marine. And taking their influence into account, and the many advantages we enjoy in our situation, the extent of our manufactures, and the character of our people, we run little risk in predicting a lengthened career of increase and prosperity to our mercantile navy.

The peculiar burdens, disadvantages, and drawbacks which recently affected, and which still in part affect our shipping, were set in a clear light in the treatise on "Our Navigation Laws and Mercantile Marine," by W. S. Lindsay, Esq., M.P. His practical acquaintance with the subject made his suggestions of more than ordinary value, and procured for them an extra degree of attention.

The existing law with regard to British shipping has been consolidated and embodied in the Mercantile Shipping Act of 1854, the 17 & 18 Vict. c. 104. It is divided into parts, which will be found distributed under their proper titles in this work. The distinguishing characteristics of British shipping, as described in this act, may be shortly stated as follows, viz.:—

1st. No ship can be a British ship unless she be registered as such.

2nd. All ships of whatever built, and however manned, may be registered as British ships, provided they be really and *bonâ fide* the property of British subjects.

* The prohibition against the registration of foreign built ships was repealed in 1849; and in 1850, 1851, and 1852, only 57, 26, and 28 such ships were registered. But in consequence of the greatly increased demand for shipping, the number of foreign registrations has since increased considerably. In 1854, they amounted to 267 ships of 97,641 tons burden.

The clauses in the act having reference to this matter are as follows, viz.:—

Description and Ownership of British Ships.—No ship shall be deemed to be a British ship unless she belongs wholly to owners of the following description; viz.:

(1.) Natural-born British subjects.

Provided that no natural-born subject who has taken the oath of allegiance to any foreign sovereign or state shall be entitled to be such owner as aforesaid, unless he has subsequently to taking such last-mentioned oath taken the oath of allegiance to H. Majesty, and is and continues to be during the whole period of his so being an owner resident in some place within H. M.'s dominions, or if not so resident, member of a British factory, or partner in a house actually carrying on business in the U. K. or in some other place within H. M.'s dominions:

(2.) Persons made denizens by letters of denization, or naturalized by or pursuant to any act of the imperial legislature, or by or pursuant to any act of ordinance of the proper legislative authority in any British possession.

Provided that such persons are and continue to be during the whole period of their so being owners resident in some place within H. M.'s dominions, or if not so resident, members of a British factory, or partners in a house actually carrying on business in the U. K. or in some other place within H. M.'s dominions, and have taken the oath of allegiance to H. M. subsequently to the period of their being so made denizens or naturalised.

(3.) Bodies corporate established under, subject to the laws of, and having their principal place of business in the U. K. or some British possession.—§ 18.

British Ships with certain Exceptions must be registered.—Every British ship must be registered in manner hereinafter mentioned, except,

(1.) Ships duly registered before this act comes into operation:

(2.) Ships not exceeding 15 tons burden employed solely in navigation on the rivers or coasts of the U. K., or on the rivers or coasts of some British possession within which the managing owners of such ships are resident:

(3.) Ships not exceeding 30 tons burden, and not having a whole or fixed deck, and employed solely in fishing or trading coastwise on the shores of Newfoundland or parts adjacent thereto, or in the Gulf of St. Lawrence, or on such portions of the coasts of Canada, Nova Scotia, or New Brunswick as lie bordering on such gulf:

And no ship hereby required to be registered shall, unless registered, be recognised as a British ship; and no officer of customs shall grant a clearance or transire to any ship hereby required to be registered for the purpose of enabling her to proceed to sea as a British ship, unless the master of such ship, upon being required so to do, produces to him such certificate of registry as is after mentioned (see art. REGISTRY); and if such ship attempts to proceed to sea as a British ship without a clearance or transire, such officer may detain such ship until such certificate is produced to him.—§ 19.

In another part the act imposes the following penalties on the masters and owners of ships unduly assuming a British character, viz.:—

(1.) If any person uses the British flag and assumes the British national character on board any ship owned in whole or in part by any person not entitled by law to own British ships, for the purpose of making such ship appear to be a British ship, such ship shall be forfeited to H. M., unless such assumption has been made for the purpose of escaping capture by an enemy or by a foreign ship of war in exercise of some belligerent right; and in any proceeding for enforcing any such forfeiture the burden of proving a title to use the British flag, and assume the British national character shall lie upon the person using and assuming the same.

(2.) If the master or owner of any British ship does or permits to be done any matter or thing, or carries or permits to be carried any papers or documents, with intent to conceal the British character of such ship from any person entitled by British law to inquire into the same, or to assume a foreign character, or with intent to deceive any such person as lastly-herein-before mentioned, such ship shall be forfeited to H. M.; and the master, if he commits or is privy to the commission of the offence, shall be guilty of a misdemeanour.

(3.) If any unqualified person, except in the case of such transmitted interests as are herein-before mentioned, acquires as owner any interest, either legal or beneficial, in a ship using a British flag, and assuming the British character, such interest shall be forfeited to H. M.

(4.) If any person on behalf of himself or any other person or body of persons, wilfully makes a false declaration touching the qualification of himself or such other person or body of persons to own British ships or any shares therein, the declarant shall be guilty of misdemeanour; and the ship or share in respect of which such declaration is made, if the same has not been forfeited under the foregoing provision, shall, to the extent of the interest therein of the person making the declaration, and, unless it is shown that he had no authority to make the same, of the parties on behalf of whom such declaration is made, be forfeited to H. M.

And in order that the above provisions as to forfeitures may be carried into effect it shall be lawful for any commissioned officer on full pay in the military or naval service of H. M., or any British officer of customs, or any British consular officer, to seize and detain any ship which has, either wholly or as to any share therein, become subject to forfeiture as aforesaid, and to bring her for adjudication before the H. C. of Admiralty in England or Ireland, or any court having Admiralty jurisdiction in H. M.'s dominions; and such court may thereupon make such order in the case as it may think fit, and may award to the officer bringing in the same for adjudication such portion of the proceeds of the sale of any forfeited ship or share as it may think right.—§ 103.

Penalty for carrying improper Colours.—If any colours usually worn by H. M.'s ships, or any colours resembling those of H. M., or any distinctive national colours, except the red ensign usually worn by merchant ships, or except the union jack with a white border, or if the pendant usually carried by H. M.'s ships or any pendant in anywise resembling such pendant, are or is hoisted on board any ship or boat belonging to any subject of H. M., without warrant for so doing from H. M., or from the Admiralty, the master of such ship or boat, or the owner thereof, if on board the same, and every other person hoisting, or joining or assisting in hoisting the same, shall for every such offence incur a penalty not exceeding £500; and it shall be lawful for any officer on full pay in the military or naval service of H. M., or any British officer of the customs, or any British consular officer, to board any such ship or boat, and to take away any such jack, colours, or pendant; and such jack, colours, or pendant shall be forfeited to H. M.—§ 105.

NEUTRALITY (Fr. *Neutralité*), in politics is the term employed to indicate the state of those nations who, when a war is being carried on, take no part in the contest, and evince no particular friendship for, or enmity to, any of the belligerent powers.

NEUTRAL SHIPS in commerce, the ships belonging to neutral states, which are engaged in the trade with the ports of belligerents.

Inasmuch as the rights and duties of neutrals vary to a certain extent with the circumstances peculiar to each contest, they do not admit of being exactly defined. But they ought in all cases to conduct themselves in a spirit of perfect impartiality, and to do nothing that can be fairly considered as being especially favourable or hostile to either of the parties engaged in hostilities.

The questions that occur with regard to the proceedings of neutrals on land, seldom present much difficulty; but it is otherwise with those that sometimes grow out of their proceedings at sea, and to these we mean to confine the following remarks.

I. *Articles contraband of war.* When two nations are engaged in war, if there be any foreign article or articles necessary for the defence or subsistence of either of them, and without which it would be difficult for it to carry on the contest, the other may legitimately exert every means in its power to prevent its opponent being supplied with such

article or articles. All writers of authority on international law admit this principle; and lay it down, that a nation which should furnish a belligerent with articles *contraband of war*—that is, with supplies of warlike stores or of any article required for the prosecution of the war—would forfeit her neutral character, and that the other belligerent would be warranted in preventing such succours from being sent, and confiscating them as lawful prize. And besides being consistent with the most obvious principles, approved by jurists, and enforced in every contest, this doctrine has been sanctioned by repeated treaties. The only difficulty, indeed, that has ever arisen in regard to it, has been in respect to the articles which should be reckoned contraband of war; and in the view of obviating such difficulty, these articles have sometimes been specified in treaties and conventions. (See the references in *Lampredi del Commercio de' Popoli Neutrali*, § 9.) But this classification has not always been respected during hostilities. And it is sufficiently evident that an article which may not be contraband at one time, or under certain circumstances, may become contraband at another time, or under different circumstances. It is admitted on all hands, even by Hubner, the great advocate for the freedom of neutral commerce*, that everything that may be made *directly available* for hostile purposes is contraband, as arms, ammunition, horses, timber for ship-building, and all sorts of naval stores. The greatest difficulty has occurred in deciding as to provisions (*munitions de bouche*), which have sometimes been held to be contraband, and sometimes *not*. Lord Stowell has shown that the *character of the port* for which the provisions are destined, is a principal circumstance to be attended to in deciding whether they are to be looked upon as contraband. A cargo of provisions intended for an enemy's port, in which it was known that a warlike armament was in preparation, would be liable to arrest and confiscation; while, if the same cargo were intended for a port where none but merchantmen were fitted out, the most that could be done, according to his lordship, would be to detain it, paying the neutral the same price for it he would have got from the enemy.

A good deal has lately been said as to whether coal should or should not be reckoned contraband. But it is evident, inasmuch as steam is now largely employed in the propulsion of ships of war, that the coal by which it is generated must be reckoned among the articles described as *munitions de guerre*. This does not seem to be a conclusion about which there is any real room for doubt or hesitation; and it shows very clearly how an article that has not been contraband, may, by a change of circumstances, become entitled to that character.

By the ancient law of Europe, a ship conveying any contraband article was liable to confiscation as well as the article. But in modern practice a milder rule has been adopted, and the carriage of contraband articles is attended only with loss of freight and expenses, unless when the ship belongs to the owner of the contraband cargo, or when the simple misconduct of conveying such cargo has been connected with other malignant and aggravating circumstances. Of these, a false destination and false papers are justly held to be the worst.

It appears pretty evident that the principle on which the doctrine of goods contraband of war has been established may justify, or rather require, its extension to various important articles not hitherto or usually reckoned as contraband. The rights of belligerents to hinder neutrals from supplying their enemies with articles necessary to enable them to carry on the contest is alike clear and undoubted. But a foreign article which is indispensable or highly useful to a nation engaged in war, may not be of the class called *munitions de guerre*, and may not be directly available in the prosecution of hostilities. That, however, is really immaterial. It is enough to warrant the prevention of its importation, that without it the importers would be unable to continue the contest, or that the inconveniences resulting from the want of it would be so very considerable as to dispose them to sue for peace, or to accept reasonable terms if offered. The distinctive peculiarity of articles contraband of war is not that they belong to one class of products or another, but that *the want of them would inflict serious injury on the party by whom they are imported.*

Considered in this, its true light, the term "contraband of war" becomes of the highest importance; and there are but few products which may not be fairly brought, at one period or another, within the list of contraband articles. Thus, supposing that we had the misfortune to be engaged in a contest either with a single power or a combination of powers, which had means to intercept, cut off, or materially obstruct our supplies of corn, cotton, and tea: can any one doubt that our enemies would be justified, or that they would hesitate, in availing themselves of so powerful a means of annoyance? Neutrals might protest against such a proceeding, on the ground that the articles referred to had not hitherto been reckoned contraband of war, and they might also allege

* *De la Saisie des Bâtimens Neutres*, tom. i., p. 193.

that their trade would be seriously prejudiced by so unusual and so illegal a proceeding. But these representations, supposing them to be made, would not go for much. Our enemies would say, that in defining contraband of war, everything depended on circumstances; and that as the want of the articles referred to would lay us under very considerable difficulties, they were, from that very circumstance, properly included in the prohibited list. They would no doubt express at the same time their regret that this conduct of theirs should be productive of injury or inconvenience to neutrals. That was not its purpose. They had resorted to it in the exercise of their undoubted rights as belligerents *; and it was only indirectly and by accident that it affected neutrals. When great nations are at war, such contingencies can seldom be avoided; and when they occur, they should be ascribed to the necessity of the case, and afford no reasonable ground of complaint.

A wish to obviate the disputes that have so frequently arisen in regard to contraband articles and other matters having reference to the proceedings of neutrals, gave birth to the following very important document.

"*Declaration respecting Maritime Law, signed by the Plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in Congress at Paris, April, 16, 1856.*

"The Plenipotentiaries who signed the Treaty of Paris of the 30th of March, 1856, assembled in Conference, —

"Considering:

"That Maritime law, in time of war, has long been the subject of deplorable disputes;

"That the uncertainty of the law, and of the duties in such a matter, gives rise to differences of opinion between neutrals and belligerents which may occasion serious difficulties, and even conflicts;

"That it is consequently advantageous to establish a uniform doctrine on so important a point;

"That the Plenipotentiaries assembled in congress at Paris cannot better respond to the intentions by which their Governments are animated, than by seeking to introduce into international relations fixed principles in this respect;

"The above-mentioned Plenipotentiaries, being duly authorised, resolved to concert among themselves as to the means of attaining this object; and, having come to an agreement, have adopted the following solemn Declaration: —

"1. Privateering is, and remains, abolished;

"2. The neutral flag covers enemy's goods, with the exception of contraband of war.

"3. Neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag.

"4. Blockades, in order to be binding, must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy.

"The Governments of the undersigned Plenipotentiaries engage to bring the present Declaration to the knowledge of the States which have not taken part in the Congress of Paris, and to invite them to accede to it.

"Convinced that the maxims which they now proclaim cannot but be received with gratitude by the whole world, the undersigned Plenipotentiaries doubt not that the efforts of their Governments to obtain the general adoption thereof will be crowned with full success.

"The present Declaration is not and shall not be binding, except between those Powers who have acceded, or shall accede, to it.

"Done at Paris, the 16th April, 1856."

But the "uncertainty" complained of in the above Declaration is not of a kind that can be got rid of. It is inherent in the subject. Maritime laws of the class now under consideration do not rest on any fixed or immutable principles. They necessarily vary with the varying condition and exigencies of society. And those rules and regulations that may in the estimation of one country appear to be alike just and expedient, may in

* Une puissance belligérante ne peut voir avec indifférence que son ennemi se renforce par des marchandises qui servent directement et indubitablement à faire la guerre; et elle ne blesse pas le droit des gens si elle empêche que ses marchandises ne parviennent à l'ennemi en les détenant, soit pour en payer la valeur au propriétaire, soit pour les restituer quand le danger sera passé. On peut même imaginer des cas, où les circonstances extraordinaires justifiéraient une telle détention à l'égard des marchandises, qui ne servent pas exclusivement à l'usage de la guerre, et sur lesquelles elle ne peut dans la règle s'arroger aucune disposition. (Martens, *Précis du Droit Public*, lib. viii. cap. 7, § 315.) Heineccius says, "Dans une guerre il ne s'agit pas même de demander s'il peut être permis à quelqu'un de porter à notre ennemi ce qui peut lui être nécessaire, puisque nous avons le droit de prendre les armes contre quiconque s'opposerait à notre défense ou la rendrait difficile ou incertaine." (Quoted by Lampredi, p. 47, Paris, 1802; see also Vattel, book iii. cap. 7. § 113, and a host of other authorities

that of another be held, on quite as good grounds, to have exactly the opposite qualities. The above Declaration expressly excepts articles contraband of war from the privileges conceded to goods on board neutral ships; but it does not specify the articles which are to be considered contraband. And it was quite as well that this vexed, or rather insoluble question was left open; for it is most probable that the plenipotentiaries who subscribed the Declaration would not have agreed on any definition. And supposing they had subjoined a list of contraband articles to the Declaration, it would very speedily have ceased to be of any weight. Whether an article should or should not be deemed contraband depends on circumstances which it is impossible to foresee or appreciate beforehand. And such being the case, it is futile to attempt to prevent further disputes by making out lists of contraband articles. We have seen that this has been frequently attempted, and it has as frequently failed. Such lists may be respected for a while; but as soon as any contracting party or great power conceives that it would be for her interest or advantage to exclude some articles from, and to include others in, the list, there is an end of its influence and authority.

The principle that free ships make free goods, or that the flag covers the cargo (*que le pavillon couvre la marchandise*), and that consequently enemies' goods, not contraband of war, may be safely conveyed in neutral bottoms, after being long resisted by this and most maritime states, has been assented to in the above declaration. In judging of the wisdom of this concession, everything depends on the interpretation of the phrase "contraband of war." If it were restricted, as has usually been the case, to warlike stores (*munitions de guerre*), or articles directly available for warlike purposes, it would be in many respects justly censurable. For it is plain, that under the limitation now supposed, the trade of a belligerent power, with its colonies or other countries beyond sea, might be prosecuted in neutral ships nearly to the same extent, and with as much security, during war as during peace. But it is not easy to imagine that a principle having such consequences should be acted upon by any power having a preponderating naval force, in the event of her engaging in hostilities. Such power must then do one of two things: she must either consent to relinquish some of the most important advantages to be derived from her naval ascendancy, or she must reject the principle in question. And there is little doubt that she would adopt the latter alternative; and she might do this directly, by resorting to her natural and indefeasible right to seize enemies' goods wherever they are to be met with; or indirectly, by extending the list of contraband articles, so as to make it include all those of any importance carried by sea into or from the enemy's ports. Either way would answer the purpose; and we may be pretty well assured, that under the supposed circumstances one or other of them would be followed.

II. *Blockade, Influence of.*— But it may perhaps be said, that though the right to carry enemies' goods not contraband of war be conceded to neutrals by the Declaration of Paris, that right is restricted and confined within proper limits by the maintenance of the system of blockade. But we take leave to doubt whether this restriction be good for much. It is distinctly laid down in the Declaration, that to be binding or legal, a blockade must be effective; that is, it must be "maintained by a force sufficient really to prevent access to the coast of the enemy." But though the blockade of one or of a few ports may perhaps be made effective, it is abundantly certain that no such blockade can ever be made to apply to an extensive coast. Though our navy were doubled or trebled, it would not suffice to make an effective blockade of the coasts of France, of Spain, or of the United States. And why should a country with a powerful naval force bind herself beforehand to employ it only in one way? Why not employ it in any way, whatever it may be, which happens to be at the time most conducive to the ends she has in view?

But supposing that an impossibility may be realised, or that an extensive coast may be effectually blockaded, the circumstance would be of much less consequence now than formerly, or than is generally imagined. Suppose, for example, that we are at war with France, and that we effectively blockade every portion of her coast, whether on the ocean or the Mediterranean: the result would be, that the oversea produce suitable to her wants would be imported into the contiguous ports of Belgium, Spain, and Piedmont, and that it would be carried from them by railways and otherwise to every part of France; and that the produce she has to export would be disposed of in the same way.

It is plain, therefore, that these are not matters in which much dependence can be placed on the resource of blockades. These may be advantageously resorted to when the object is to reduce a town, to obstruct the trade of a port or a river, to prevent the sailing of a squadron, and so forth; but as measures directed against the trade of any great country, they must be nearly, if not wholly, impotent. In the case of France, it is quite clear that the strictest possible blockade would not inflict half the injury on her

that its maintenance would entail upon ourselves. If the trade of neutrals in war is to be influenced by nothing but effective blockades, it may be held to be practically free from all obstruction. But it cannot be supposed that when the evil day comes it will be so dealt with. When the existence of nations is at stake, they will not be withheld by declarations like the above from availing themselves of every means by which they may hope either to promote their own security or to injure their enemies.

III. *Influence of the new System over the Trade of Belligerents.*—It is further obvious, were the rules laid down in the Declaration of 1856 to be carried into effect without large additions being made to the list of contraband articles, that neutrals would engross almost the entire oversea trade of countries engaged in war. Comparatively few of the articles which we export come under the description of warlike stores; and supposing that we were engaged in hostilities, neutral ships which did not take on board contraband articles would navigate with perfect security, while our ships would be exposed to the risk of capture. The magnitude of this risk would depend on various contingencies, and would be measured by the higher premium of insurance that would have to be paid on them and on articles embarked in them. But considering the close competition to which our shipowners are already exposed, the additional premium they would have to pay, even though it were not very considerable, would most probably turn the scale in favour of the neutrals; and if they were once introduced and employed for any considerable period, it might not be an easy matter for our shipowners to regain the ground they had lost, or to recover their former position, on hostilities being terminated. But in whatever way it may be defeated or eluded, it is not to be supposed that we should abide, in periods of war and difficulty, by a rule that would tie up our hands and consign the entire oversea trade of the empire to foreigners. This would be a degree of liberality to which we can hardly be expected ever to arrive, and which, were it realised, would be more injurious to our best interests than the most intense selfishness.

IV. *Project for exempting Private Property at sea from Attack during War.*—Some of the more recent opponents of the old system of maritime law do not deny these statements. But they allege that they are founded on false principles. Private property, say they, is now respected in all contests carried on by land; and it would be for the advantage of all nations, whether belligerent or neutral, were the same humane and generous policy extended to private property at sea. But this sort of reasoning is more specious than solid. On a little examination it will be found that the cases have no real analogy. Private property on land, and the treasures of art and learning, are respected so far, that they are sometimes unconditionally, but frequently also on the payment of a contribution or ransom, exempted from injury. This is done because experience has shown that, while the destruction of the articles referred to may be productive of much misery and loss, it has little or no influence over the decision of the contest. But we are not hence to infer that the destruction of private property at sea will be equally ineffectual. In our unfortunate contest with the United States in 1814, the destruction of the Capitol at Washington was an act disgraceful to our arms, and which had no effect except to inflame the hostile feelings of the Americans. But the severe check which the contest gave to the trade of the Union made the citizens generally averse to the war; and was, indeed, the main cause of its being so speedily terminated. No such result could, however, have happened had American merchant ships been exempted from capture or molestation.

Suppose we are at war, and that our enemy, having succeeded in landing a force in some part of the kingdom, such as Kent or Connaught, inflicts on the peasantry outrages similar to those which the troops of Louis XIV. inflicted on the defenceless inhabitants of the Palatinate; such proceedings, by not sensibly affecting either our wealth, or the sources of our power, would in no wise accelerate the termination of hostilities. On the contrary, they would tend to their prolongation, by inspiring us with a strong desire to avenge such wanton and unnecessary cruelty. But it would be quite another matter were our enemy able seriously to obstruct our trade, to prevent our exports, or to sink, burn and destroy the ships that were conveying to us supplies of necessary articles. Such proceedings might lay us under the greatest difficulties, and would be the most likely means to make us listen to proposals for an accommodation.

Everybody knows that the unpopularity of the French rule in Germany and other parts of the Continent, in the latter part of the war against Napoleon, was in great measure occasioned by the destruction of their trade, which, on the one hand, rendered their corn and other disposable produce a mere drug, while, on the other, it added enormously to the prices of cotton, sugar, coffee, and most foreign articles. But had the rules and regulations embodied in the Declaration of 1856 been then in force, no such result would have happened. We should have had the singular combination of mari-

time peace with territorial war. And the trade of Prussia, Holland, and the other countries subject to France, and, indeed, of France herself, would have been as securely and cheaply carried on in neutral bottoms as it would have been in a period of universal tranquillity. Nothing, therefore, can be more contradictory and illogical than to contend that we are bound to extend the same immunity during war to private property at sea that is extended to private property on land. The cases are in no degree parallel. In the one, private property is respected because its destruction is seldom injurious except to the individuals immediately interested, and has little or no general influence; in the other case, private property is seized or destroyed because those from whom it is taken, being the carriers or purveyors of necessary articles for the community, their loss must seriously affect the latter, and may reduce them to the greatest straits.

V. *Abolition of Privateering.*—The abolition of privateering by the Declaration of Paris is of the highest importance, and should give general satisfaction. This practice appears to be a remnant of that system of private war which is universally waged by individuals in early or barbarous ages, but which gradually disappears as society advances. Privateers rarely attack ships of war. They do not act in concert, or with any object in view other than their own private gains. They are, in truth, a sort of legalised robbers *; and while they occasion much individual suffering, they have little or no influence over the result of the war. But their employment is principally objectionable from its having been found that, despite every precaution, it is not possible to hinder them from committing the greatest excesses. The desire to amass plunder is the ruling passion by which they are actuated; and being so, it would be childish to suppose that they should be scrupulous in their proceedings, or that they should endeavour to keep within the pale of the law when they think that their objects will be likely to be promoted by overstepping its limits. And hence their injurious treatment of the ships of neutral and friendly powers. A system of this sort may perhaps be useful to a nation which has little trade, and may hope to acquire riches by fitting out privateers, without being exposed to the risk of retaliation. But except under very peculiar circumstances, it is difficult to suppose that it should be advantageous to a nation with an extensive oversea trade. A notion has, indeed, been long entertained, that while the interests of humanity would be promoted, the rights of belligerents would not be injuriously affected by the abolition of privateering. It was stipulated, for instance, in the treaty between Sweden and the United Provinces in 1675, that neither party should in any future war grant letters of marque against the other; and stipulations to the like effect have since been embodied in various treaties. These, however, being only isolated efforts, were insufficient materially to abate the nuisance, which could not be put down without an agreement to that effect by the great powers, such as has been announced in the Declaration of 1856.

The United States, however, though possessed of a most extensive mercantile marine, have refused to consent to the abolition of privateering. But they have not done this capriciously; nor is it to be denied that there is a great deal of weight in the reasons given by the American government for their refusal.† They grow out of circumstances peculiar to the United States,—that is, of their warlike navy bearing but a very small proportion to their mercantile navy, which is the largest in the world. And they contend, that were they to abolish privateering, their merchant ships would be captured in vast numbers by the numerous cruisers of their enemies; while the merchant ships of the latter, owing to the fewness of their own ships of war, would be comparatively little affected; and that to restore the balance, and place themselves on a level with their opponents, they have no resource but to appeal to the patriotism (selfishness) of their citizens by licensing privateers.

The Americans have, however, intimated their willingness to assent to the abolition of privateering, provided the other powers agree not to attack or molest private ships at sea during war. Such an agreement would no doubt be very much for their advantage; but we have already seen that it is not one to which we can consent without at the same time, and by the same act, consenting to forego the use of some of the most powerful of our means of defence and attack. This, however, is about the very last thing that we either should or will do. No British statesman will ever agree to an arrangement that would diminish our powers and paralyse our energies at the very moment when, perhaps, our independence and security may depend on these being exerted to the utmost.

* L'armateur indifférent au sort de la guerre et souvent de sa patrie, n'a d'autre amorce que l'avidité du gain, d'autre récompense que ses prises et les prix attachés par l'état à ses pirateries privilégiées. (Martens, *Essai sur les Armateurs*, cap. i. § 8.) This essay, which was translated into English, and published in 1801, contains the fullest details in regard to privateering. Valin, who defends and even eulogises privateering, admits that it is very apt *dégénérer en abus et en brigandage*. (*Traité des Prises*, i. cap. I. § 7.)

† See Letters of Mr. Marcy to the Count de Sartiges, 28th July, 1856.

VI. *Right of Search.* — Nothing is said in the Declaration of 1856 in regard to the right of visitation and search, probably because it is obviously inherent in belligerents; for it would be contradictory to allow that they had a right to prevent the conveyance of contraband goods to an enemy, and to deny them the use of the only means by which such right can be made available. The object of the search is twofold: *first*, to ascertain whether the ship is neutral or an enemy, for everybody knows that the circumstance of its hoisting a neutral flag affords no security that it is really such; and, *secondly*, to ascertain whether it has contraband articles or enemies' property on board. All neutral ships that would navigate securely during war must consequently heave-to when summoned by the cruisers of either belligerent, and be provided with passports from their government, and with all the papers or documents necessary to prove the property of the ship and cargo: and they must carefully avoid taking any contraband articles, and perhaps also belligerent property, on board. And hence it has been generally admitted that a merchant ship which seeks to avoid a search by crowding sail or by open force, may be justly captured and confiscated.

One of the most difficult questions in regard to the right of search has reference to merchantmen sailing under convoy. Is the allegation of the officer commanding the vessel of war convoying the merchantmen, that the latter have no contraband articles or belligerent property on board, to be held to be sufficient to nullify the right of search? or may the exercise of that right be notwithstanding insisted upon?

A case of this sort occurred in the early part of 1798, when a fleet of merchantmen belonging to Sweden, a neutral power, and sailing under convoy of a frigate, were detained by a British squadron. The Swedish captain, on the question being put to him, answered that the ships were destined for different ports of the Mediterranean, and that they were laden with hemp, iron, pitch, and tar. These articles were the produce of Sweden *; but as they have most commonly been reckoned contraband of war, and as France and her allies had many ports on the Mediterranean, there can be little or no doubt that we were warranted, despite the threatened but unattempted opposition of the Swedish captain, in detaining the ships. But besides being detained, they were condemned with their cargo as lawful prize; a proceeding which gave rise to a great deal of discussion at the time, and which it is not easy to justify.†

In the event of the captain of a ship of war convoying neutral merchantmen distinctly declaring that they have no contraband articles or enemies' property on board, their detention or search would be a very strong measure. It would, in truth, be an insult to the flag and honour of the neutral power. And unless the presumptions that the captain had emitted a false declaration were exceedingly strong, to question his veracity would be an act contrary to the comity of nations, and one that a high-spirited people would be sure to resent. But except in the case of a *limited* number of vessels sailing to specified ports under convoy, and when there is a clear and explicit declaration by the officer in command that they have neither contraband articles nor belligerent property on board, the right of search, supposing it to be exercised without any unnecessary violence, is one that is essential to belligerents, and cannot be justly objected to.

VII. *Foreign Enlistment Act.* — It will be evident that in treating this subject we have referred only to those general principles that prevail in international law. The laws of individual states in regard to neutrality harmonise for the most part with the public law respecting it. The only British statute to which it is necessary to refer is the Foreign Enlistment Act, the 59 Geo. 3. c. 69. It prohibits the employment of British ships without license in the service of any foreign prince or state, and their employment as transports or store-ships by states with which we are not at war. But it is believed that all, or nearly all, that this act prohibits being done directly, may be done indirectly with little difficulty. Inasmuch, however, as it can hardly fail, if maintained, to give rise to troublesome questions with foreign governments, it were better were it repealed, and our merchants and shipowners left to deal, as they think fit, with the ordinary risks that attach to those that carry contraband articles. The circumstances in which the act originated have long since passed away.‡ And as it can no longer be of any use, and may, or rather must, occasion difficulties, its abolition would be a judicious measure.

NEW ORLEANS, the capital of Louisiana, one of the United States, on the eastern bank of the Mississippi, about 105 miles from its mouth, lat. 29° 57′ 45″ N., lon. 90° 9′ W. Population, in 1850, 119,461. The new-built streets are broad, intersecting each other at right angles; and the houses are mostly of brick. It is the grand emporium of all the vast tracts traversed by the Mississippi, the Missouri, and their tributary streams, enjoying a greater command of internal navigation than any other city either of the

* Articles which form a considerable part of the produce of a country, though contraband of war, have sometimes been allowed to be conveyed in neutral ships. But even in that case belligerents have been accustomed to detain them, not for confiscation, but for pre-emption. (Robinson's *Admiralty Reports*, i. 244.)

† For an account of this famous case, see Robinson's *Admiralty Reports*, i. pp. 340–379. In an elaborate argument, Sir William Scott (afterwards Lord Stowell) states, with his usual ability, but with too sensible a bias, the reasons for his judgment. Its legality was questioned in a tract by Mr. J. F. W. Schlegel, professor at Copenhagen, translated into English, and published in London in 1801. Schlegel was answered by Dr. Croke in a tract entitled *Remarks on Mr. Schlegel's Work on the Visitation of Neutral Vessels under Convoy*, published in the course of the same year.

‡ The struggle between Spain and her revolted colonies in S. America.

Old or New World. Civilisation has hitherto struck its roots, and begun to flourish only in some comparatively small portions of the immense territories of which New Orleans is the sea-port; and yet its progress has been rapid beyond all precedent. It appears, from the accounts printed by order of Congress, that during the year ended the 30th of June, 1858, the value of the native American produce exported from this city amounted to 88,270,224 dollars, while the value of that exported from New York was 89.039,741. With respect to imports, the case is materially different; the value of those of New Orleans, in the year just mentioned, being only 19,586,033 dollars, whereas those of New York amounted to 178,475,736. It is believed by many, seeing how rapidly settlements are forming in the "West," that New Orleans must, at no very distant period, exceed every other city of America, as well in the magnitude of its imports as of its exports; and, considering the boundless extent and extraordinary fertility of the uncultivated and unoccupied basins of the Mississippi and Missouri, the anticipations of those who contend that New Orleans is destined to become the greatest emporium, not of America only, but of the world, will not appear very unreasonable. Steam navigation has been of incalculable service to this port, and, indeed, to the whole of central America. The voyage up the Mississippi, that used formerly to be so difficult and tedious, is now performed in commodious steam packets with ease, celerity, and comfort. "There have been counted," says Mr. Flint, "in the harbour, 1,500 flat boats at a time. Steam boats are arriving and departing every hour; and it is not uncommon to see 50 lying together in the harbour. A forest of masts is constantly seen along the *levée*, except in the sultry months. There are often 5,000 or 6,000 boatmen from the upper country here at a time; and we have known *thirty* vessels advertised together for Liverpool and Havre. The intercourse with the Havannah and Vera Cruz is great, and constantly increasing."—(*Geography and History of the Western States*, vol. i. p. 557.) As a shipping port, New Orleans now ranks third in the Union; being in this respect inferior only to New York and Boston. Vessels of the largest burden may navigate the river several hundreds of miles above the city. The agg. burden of the shipping belonging to the port on the 30th June, 1858, amounted to 210,411 tons; of which 70,072 were employed in steam navigation. In the year ending the 31st August, 1852, the arrivals of steamers, principally from the interior, were 2,784. The depth of water in the river opposite to New Orleans is, at a medium, about 70 feet; and it maintains soundings of 30 feet till within a mile of its confluence with the sea. Besides 3 or 4 of inferior consequence, the Mississippi has 4 principal passes or outlets. In the south-east, or main-pass, at Balize, the water on the bar at ordinary tides does not exceed 12 feet; and as the rise of tides in the Gulph of Mexico is not more than 2 or 2½ feet, vessels drawing much water cannot make their way from the ocean to New Orleans.—(*Darby's View of the United States*, p. 467.)

The unhealthiness of the climate is the great drawback on New Orleans. This probably arises from the low and marshy situation of the city and surrounding country, which is under the level of the Mississippi, being protected from inundation by an artificial *levée* or mound, varying from 5 to 30 feet in height, and extending along the bank of the river a distance of 100 miles. The unhealthy season includes July, August, and September; during which period the yellow fever often makes dreadful havoc, particularly among the poorer classes of emigrants from the North and from Europe. Latterly, great efforts have been made to improve the health of the city, by supplying it abundantly with water, paving the streets, removing wooden sewers, and replacing them with others of stone, &c. Many places, where water used to stagnate, have been filled up; and large tracts of swampy ground contiguous to the town have been drained. And as such works will no doubt be prosecuted on a still larger scale, according to the increase of commerce and population, it is to be hoped that the ravages of fever may be materially abated, though the situation of the city excludes any very strong expectation of its ever being rendered quite free from this dreadful scourge.

We are sorry, however, to have to state that hitherto this expectation has not been realised, and that the mortality from yellow fever during the autumn of 1853 was quite excessive. It has latterly been proposed to bring earth from the upper parts of the Mississippi, and to employ it in forming a site for a new city raised some feet above the level of the river. It is believed that this would be the most likely means to guard against fever; and the object in view is of such paramount importance that the expense of the scheme should be reckoned a very inferior matter.

The following Tables give a pretty complete view of the trade of this great and growing emporium. Its preponderance in the shipment of cotton is quite as decided as the preponderance of Manchester in its manufacture.

Account of the Quantities of the Principal Articles imported from the Interior to New Orleans during the Year ending 31st August, 1858, with their average Prices and Gross Values.

Imports of Specie for 12 Years, from 1st September to 31st August.

1846-47 -	6,680,050 dolls.	1850-51 -	7,937,119 dolls.	1854-55 -	3,746,037 dolls.
1847-48 -	1,845,808	1851-52 -	6,278,523	1855-56 -	4,913,540
1848-49 -	2,501,250	1852-53 -	7,865,226	1856-57 -	6,500,015
1849-50 -	3,792,662	1853-54 -	6,967,056	1857-58 -	13,268,013

The *Picayune* publishes the following comparative statement of imports through the custom-house of New Orleans, for the fiscal years ending the 30th of June of each year, of *1856-57-58*: —

	1856.	1857.	1858.
	Dolls.	*Dolls.*	*Dolls.*
Dutiable - - - -	8,000,583	16,417,034	10,248,002
Free - - - -	6,417,596	6,637,076	4,818,015
Specie and bullion - - -	1,775,148	1,927,050	4,621,246
Total - - -	17,183,327	24,981,150	19,687,263
Exports - - - -	80,547,968	91,514,286	88,382,458

The imports into New Orleans have never exceeded the present year (1858), except for the year ending the 30th of June, 1857. At all the northern ports there has been a great falling off — much larger, *pro rata*, than in New Orleans.

It will be observed that there is a decrease in the amount of exports from last year of a little over 3,000,000 dollars.

Total	904,910	145,174	38,447	648,866	18,726	17,275	60,058	711,628

In the above, the exports to Mobile, etc., via the Pontchartain Railroad and New Canal, are included.

In so far as the trade with foreign countries is concerned, the great increase has been in the export of cotton, flour, tobacco, Indian corn and meal, &c. Cotton, for example, has increased from 740,155 bales in 1841–42, worth 24,425,115 dolls., to 1,678,616 bales in 1857–58, worth 88,127,340 dolls.; flour, from the value of 3,708,848 dolls. in 1851–52, to 7,078,213 dolls. in 1857–58; tobacco, from 7,196,185 dolls. in 1851–52, to 13,703,477 dolls., and so on.

Sugar.—We subjoin a statement of the sugar produced in Louisiana during each of the 24 years ending with 1857. The statement sets the precarious nature of this branch of industry in a striking light. An unfavourable season for planting, or the occurrence of frost a little earlier than usual, will reduce the crop a half; so that the amount of the produce can never be estimated beforehand. It partakes more of a gambling character than any other branch of industry carried on in the States. But notwithstanding these adverse circumstances, the culture of the cane has greatly increased.

Banks.—There were on the 1st January, 1858, 19 banks in the State of Louisiana, and mostly in New Orleans. Their aggregate capital amounted to 21,730,400 dolls.; their circulation to 4,535,949 dolls.; their deposits to 13,539,274 dolls.; and their specie

to 18,505,213 dolls. They do not differ in any material degree from the banks in other parts of the Union, and are quite as little entitled to credit or confidence.

For *Monies, Weights, and Measures*, see *New York*.

New Orleans Levee Dues.—The subjoined ordinance, passed by the Common Council of the city and approved by the mayor, 25th May, 1852, is now in force.

An Ordinance to regulate the Levee and Wharfage Dues on Ships and Vessels arriving from Sea, and on Steamboats, Flats, Barges, &c.

Art. 1. That from and after the passage of this ordinance the levee or wharfage rates on ships or other sail vessels, steamships, steamboats, flats, barges, and other craft, shall be fixed as follows: —

On all ships or sail vessels of 1,000 tons and under, 25 cents per ton.
Excess of tonnage over 1,000 tons, 20 cents per ton.
On all steamships, 17½ cents per ton.
On all steamboats of 1,000 tons and under, 15 cents per ton.
Excess of tonnage over 1,000 tons, 10 cents per ton; *provided*, the boats arriving and departing more than once each week, shall pay only two-thirds of these rates.
On each flatboat not measuring over 80 feet, $ 10.
On each flatboat measuring 80 to 100 feet, $ 12.
On each flatboat measuring over 100 feet, $ 15.
On each barge more than 70 feet long, $ 12.
On each barge less than 70 feet, and not exceeding 15 tons burden, $ 8.
On each steamboat hull used as a barge, $ 25.
On each scow and coastwise pirogue, $ 2.
For every flatboat, barge, or other vessel, not including steamboats, employed in the transportation of brick, lumber, or other building materials, or in bringing produce from this and neighbouring parishes to this city, and measuring not over 25 tons, the levee and wharfage dues shall be $ 50 per annum.
From 25 to 50 tons, $ 60 per annum.
Over 50 and not exceeding 75 tons, $ 80 per annum.
Over 75 and not exceeding 100 tons, $ 125 per annum.
Over 100 tons, $ 200 per annum.

Art. 2. Every proprietor of any small craft of the description above mentioned, who shall desire to enjoy the privilege accorded by the present ordinance, must apply to the treasurer of the city of New Orleans for the purpose of obtaining a license, approved by the mayor, and countersigned by the controller, which license shall specify the number or name of such craft, which shall be painted in a conspicuous place on the side of the said craft.

Art. 3. Hereafter it shall not be lawful for any pirogue, flatboat, barge, boat, or keelboat, to remain in port longer than eight days, under the same provisions and penalties contained in art. 5. of an ordinance of the General Council, approved May 20, 1843.

Art. 4. That the payment of the levee dues on ships or sail vessels, steamships, and steamboats, shall be exacted and collected by the collectors of levee dues, and an extra duty of one-third these rates shall be paid by all sail vessels or steamships which may remain in port over two months, the same to be recovered at the commencement of the third month; and if over four months, an additional duty of one third these rates.

Steamboats shall be entitled to remain thirty days in port after payment of the dues. All over thirty days to pay an additional duty of $ 2 per day.

Art. 5. That all vessels now in port, and that have paid a daily or weekly wharfage, shall be allowed (and the collectors are hereby authorised) to deduct the amount so paid from the rates now to be collected.

All ordinances or parts of ordinances conflicting with the foregoing be, and the same are hereby, repealed.

Tariff of Commercial Charges and Rates adopted by the New Orleans Chamber of Commerce, in 1846 and 1848, and amended 10th May, 1852.

Commission on Sales.

Sugar, cotton, tobacco, lead, flour, and other products of the soil	2½ per cent.
Domestic manufactures, and all foreign merchandise	5 —
Guarantee of sales on time	2½ —
Purchase and shipment of merchandise or produce	2½ —
Sales or purchase of stock and bullion	1 —
Collecting and remitting dividends	1 —
Selling vessels or steamboats	2½ —
Purchasing do.	5 —
Procuring freights	5 —
Collecting freights from foreign ports	2½ —
Coastwise	5 —
Outfits and disbursements	2½ —
Effecting insurance	½ —
Adjusting or collecting insurance or other claims without litigation	2½ —
With litigation	5 —
Purchasing and remitting drafts, or receiving or paying money on which no other commission has been charged	1 —
If bills remitted are guaranteed, in addition	1½ —
Bills and notes remitted, for collection protested and returned	1 —
Landing, custody and re-shipping merchandise or produce from vessels in distress	2 —
Ditto, bullion or specie	1 —
Adjusting and collecting general average	5 —
Consignments of merchandise withdrawn or re-shipped per order on account of advances and responsibilities-full commission.	
On the surplus amount of invoices of such consignments, deducting advances and liabilities —half commission.	
Drawing, indorsing or negotiating foreign bills of exchange	1½ —
Ditto, on domestic bills of exchange	1 —
Receiving, entering, and re-shipping merchandise to a foreign port—on amount of invoice	1 —
On amount of advances, charges, and liabilities on same	2½ —
For drawing, accepting, negotiating, or indorsing notes or drafts without funds, produce, or bills of lading in hand	2½ —
On cash advances in all cases	2½ —
For entering and bonding merchandise for the interior—on amount of duties, freight and charges (besides the regular charge for forwarding)	2½ —
Agency for steamboats—according to special contract.	
The foregoing rates to be exclusive of brokerage and charges already incurred.	

Receiving and forwarding Merchandise, exclusive of Charges actually incurred.

Tares.

Lard, butter, cheese, tallow, stearine, sugar, rice - - - - - - actual tare.
Coffee in bags - - - - ¼ per cent.

Freights.

When vessels are chartered, or goods shipped by the ton, and no special agreement respecting the proportion of tonnage which each particular article shall be computed at, the following regulation shall be the standard : —

That the articles, the bulk of which shall compose a ton, to equal a ton of heavy materials, shall in weight be as follows : —

Coffee in casks - - -	- 1,568 lbs.;	in bags 1,830 lbs.
Cocoa - - - -	- 1,120 —	1,300
Pimento - - - -	- 950 —	1,100
Flour - - - -	- 8 bbls. of 196 lbs.	
Beef, pork, tallow, pickled fish, and naval stores - -	- 6 bbls.	
Pig and bar iron, lead, and other metals or ore, heavy dye-woods, sugar, rice, honey, or other heavy articles - -	- 2,240 lbs. gross.	
Ship bread in casks - -	- 672 lbs., bags 784; bulk, 806.	
Wines, brandy, spirits, and liquids generally, reckoning the full capacity of the cask, wine measure - - -	- 200 galls.	
Grain, peas, and beans, in casks	22 bushels; in bulk, 36 bush.	
Salt, European - -	- 36 —	
Do. West India - -	- 51 —	
Stone coal - - -	- 28 —	
Timber, planks, furs, peltries, in bales or boxes, cotton, wool, or other measurement goods	- 40 cubic feet.	
Dry hides - - -	- 1,120 lbs.	

When molasses is shipped by the hogshead, without any special agreement, it shall be taken at 110 gallons, estimated on the full capacity of the cask.

Freights (and commission on them), when in sterling money, shall be settled at $4 84 per pound sterling; and other foreign currency at the value fixed by Congress.

We avail ourselves of this opportunity to lay before the reader the following statements with respect to Mobile, with which New Orleans is intimately connected.

MOBILE, at the mouth of the Alabama river in Mobile Bay, had, in 1850, 20,513 inhab. It is now become the second port in the Union for the shipping of cotton, and it has also an extensive and rapidly increasing trade in other things, being the entrepôt for nearly the whole of Alabama. The value of the domestic produce (principally cotton) exported from this State in the year 1857–58, amounted to 21,019,266 dollars, being more than that of any other State excepting New York and Louisiana. The imports are comparatively inconsiderable, not amounting to more than 500,000 or 600,000 dollars. Mobile had on the 30th June, 1858, 47,444 tons shipping, of which nearly a half, or 21,958 tons, belonged to steamers.

The entrance to Mobile Bay is between Mobile point on the E., and Dauphin Island on the W., about 3¼ m. apart, the deepest channel having 15 feet water at low ebb; but vessels drawing more than 8 or 9 feet water cannot, owing to a shoal in the bay, reach the town except at high water. A lighthouse erected on the point, lat. 30° 16′ N., long. 88° 32′ W., exhibits a fixed light elevated 55 feet above the level of the sea.

Exports of Cotton to Foreign Ports from Mobile for the 2 Years ending 31st August, 1857, and 31st August, 1858.

Table of Entries and Clearances of Vessels at Mobile (exclusive of Steamers and other Craft navigating the Rivers and Bay) for the Year ending 30th June, 1858.

Entries.	Arrivals.			Clearances.		
	Number of Vessels.	Amount of Tonnage.	Number of Crew.	Number of Vessels.	Amount of Tonnage.	Number of Crew.
American	125	80,778	2,010	179	114,907	2,851
Foreign	48	35,054	1,178	48	35,054	1,068
Coastwise	487	235,734	8,585	216	80,987	2,426
Total	660	351,566	11,773	443	230,948	6,345

The enormous difference which appears between the number of coastwise vessels entered and cleared, is owing to the fact that all the mail line steamers and schooners, from New Orleans, enter at the custom-house, and in no instance clear in returning.

Tariff of Charges on Cotton at Mobile.—The proprietors of the several presses and warehouses at Mobile, have adopted the following uniform tariff of charges on cotton:

	Per bale.
Factor's storage on cotton for the season	90 cents.
Compressing cotton	50 —
Extra ropes on compressed cotton, each	6¼ —
Labour on ships marked cotton	5 cents.
Drayage, compressed ditto	5 —
Wharfage, ditto	5 —
Storage on cotton going coastwise, per week	5 —
Turning out and restoring cotton	5 —
Arranging	3 —

NEWSPAPERS. Publications in numbers, consisting commonly of single sheets and published at short and stated intervals, conveying intelligence of passing events.

Importance and Value of Newspapers in a Commercial Point of View.—It is foreign to the purposes of this work to consider the moral and political effects produced by newspapers: of the extent of their influence there is no doubt, even among those who differ widely as to its effect. Their utility to commerce is, however, unquestionable. The advertisements or notices which they circulate, the variety of facts and information they contain as to the supply and demand of commodities in all quarters of the world, their prices, and the regulations by which they are affected, render newspapers indispensable to commercial men, supersede a great mass of epistolary correspondence, raise merchants in remote places towards an equality, in point of information, with those in the great marts, and wonderfully quicken all the movements of commerce. Newspapers themselves have also become an important commercial article. In 1852 the nett produce of the stamp duty levied on newspapers in the U. Kingdom was 412,956*l.*: the gross produce of the sale may be estimated at 4½ times this sum; so that on this hypothesis the newspapers produced in that year must have cost the public about 1,858,302*l.* sterling, exclusive of the sums paid for advertisements.

Newspapers, in London, are sold by the publishers to newsmen or newsvenders, by whom they are distributed to the purchasers in town and country. The newsmen, who are the retailers, receive, for their business of distribution, a regulated allowance. The papers sold to the public at *5d.*, which, down to *1855*, have formed the great mass of London newspapers, are sold to the newsmen in quires. Each quire consists of 27 papers, and has been charged to the newsmen at *8s. 9d.*; so that the newsman's gross profit on 27 papers was *2s. 6d.* In some instances where newspapers are sent by the post, ½*d.* additional on each paper has been charged by the newsmen to their country customers. Some of the clerks of the post-office, called clerks of the road, used to be considerable news agents; but this, we believe, is no longer the case. Previously to 1836 the stamp duty on a newspaper was rather under 3½*d.* (4*d.* — 20 per cent.); but it was then reduced to 1*d.* nett. A single paper being sold to the newsmen at 4*d.*, the sum which has been received by the newspaper proprietors for paper, printing, and the expenses of their establishments, has been 3*d.* for each copy. The subjoined table shows how papers have been disposed of down to the present time (*1855*) to the different classes of dealers, when the price was *5d.*, and how they would have been disposed of had the price been *6d.*

Papers at	Wholesale Newsmen, per 27 Papers.*		Retail Newsmen, per 27 Papers.		Retail Newsmen, per single Copy.*

6d.	10 9	2 9	11 3	2 3	5	1

Advertisements form a considerable source of profit to newspapers; and without them, some of those papers that are most widely circulated could not support their great expenditure. Down to 1853, all advertisements, without distinction of length, were charged with a duty of *1s. 6d.* each, which produced, in 1852, 167,695*l.* 9*s.* 5*d.* nett in Great Britain, and 13,500*l.* 18*s.* in Ireland. But this duty being on various accounts highly objectionable was then repealed. There are no means by which to learn the proportion of the advertisement duty which was paid by newspapers. Probably, however, we shall not be far wrong, if we take it at ⅘ths of the entire sum. The charges of newspapers for advertising vary with the length of the advertisements and the circulation of the papers. It is obvious, indeed, that an advertisement in a journal which is widely circulated may do more to disseminate information in regard to the matter to which it refers, than its insertion in half a dozen papers of limited circulation.

Papers have been set on foot in different parts of the kingdom which contain advertisements only. They are not sold but given away, and some of them are very extensively distributed. Their profits

* Such of the retail newsmen as have a good share of business purchase direct from the publishers at the wholesale prices.

depend on their popularity with the advertising world, or on the number of advertisements sent them.

Inasmuch, however, as but little attention is paid to what is given gratis, we doubt whether the above be really advantageous engines for advertising. It has sometimes been tried, with a view to lessen the expense of advertisements, to confine certain descriptions of them, such, for example, as notices of books, to some one journal, or class of journals. But the experiment has had no great degree of success.

The London newspapers have become remarkable for the great mass and variety of matter which they contain, the ability of their leading articles, the rapidity with which they are printed and circulated, and the accuracy and copiousness of their reports of debates. These results are obtained by a large expenditure and considerable division of labour. The reports of parliamentary proceedings are obtained by a succession of able and intelligent reporters, who relieve each other at intervals of ¾ of an hour, or occasionally less. A newspaper cannot aim at copious and correct reports with less than 10 reporters for the House of Commons; and the expense of that particular part of a morning newspaper's establishment exceeds 3,000*l.* per annum.

Regulations as to Newspapers.—The act 6 & 7 Will. 4. c. 76. introduced several new regulations with regard to newspapers. Among other things it imposed a duty of 1*d.* on every sheet of paper printed as a newspaper, provided its superficies did not exceed 1,530 sq. inches; of 1½*d.* if it exceeded 1,530 sq. inches, and did not exceed 2,295 sq. inches; and of 2*d.* if it exceeded 2.295 sq. inches. When supplements were published with newspapers, they were each charged with a duty of ½*d.* provided their superficies did not exceed 795 sq. inches.

This was neither more nor less than a device to limit the size of newspapers by imposing a peculiar tax on those publishers who might be disposed, by increasing the size of their journals, to lay the greatest supply of information or amusement before their readers. But this ingenious scheme for making a small be substituted for a large measure of intelligence has since been, if not abolished, at least materially modified. The Stamp Act of 1853, the 16 & 17 Vict. c. 63., has the following clauses; viz.

As to Duties on Newspapers and Supplements.—No higher stamp duty than 1*d.* shall be chargeable on any newspaper printed on one sheet of paper containing superfices not exceeding 2295 inches.

A supplement published with any newspaper duly stamped with the duty of 1*d.*, such supplement being printed on one sheet of paper only, and together with such newspaper containing in the aggregate a superficies not exceeding 2295 inches, shall be free from stamp duty.

Any other supplement to any such duly stamped newspaper shall not be chargeable with any higher stamp duty than ½*d.*, provided it does not contain a superficies exceeding 1148 inches.

And any two supplements to any such duly stamped newspaper shall not be chargeable with any higher stamp duty than ½*d.* on each, provided each of such supplements be printed and published on one sheet of paper only, and that they contain together a superficies not exceeding in the aggregate 2295 inches.

The superficies in all the cases aforesaid to be one side only of the sheet of paper, and exclusive of the margin of the letter press.

The act 6 & 7 Will. 4. c. 76., exempts from the duties on newspapers "any paper called *Police Gazette* or *Hue and Cry*," published in Great Britain by authority of the Secretary of State, or in Ireland by the authority of the Lord Lieutenant.

Daily accounts or bills, of goods imported and exported, or warrants or certificates for the delivery of goods, and the weekly bills of mortality; and also papers containing any list of price current, or of the state of the markets, or any account of the arrival, sailing, or other circumstances relating to merchant ships or vessels, or any other matter wholly of a commercial nature; provided such bills, lists, or accounts do not contain any other matter than what hath been usually comprised therein.

And the same act lays down the following rules; viz. a discount of 25 per cent. is to be allowed on the above duties on newspapers printed in Ireland.—§ 2.

In order to prevent fraud, in the returns as to newspapers, it is enacted, that, from the 31st of December, 1836, a separate or distinctive stamp or die shall be used for each newspaper.—§ 3.

No person is to print or publish a newspaper until after a declaration has been made and lodged at the Stamp Office, containing certain particulars (specified in the act), as to the names and addresses of the printer, and certain of the proprietors of such paper, &c., under a penalty of 50*l.* Persons wilfully making a false or defective declaration are, upon conviction, to be deemed guilty of a misdemeanor.—§§ 6, 7.

There are a number of regulations intended to provide for the discovery and liability of the printer and proprietors, the security of the duties, and the prevention of the sale of unstamped papers. A penalty of 20*l.* is imposed on any person printing, publishing, selling, &c., newspapers not duly stamped; and it is declared to be lawful for any officer of stamps, or any person authorised by the commissioners in that behalf, to seize any such offender, and take him before any justice having jurisdiction where the offence is committed, who shall summarily determine the matter, and upon conviction and default of payment, shall commit such offender to prison for some term not exceeding 3, nor less than 1 calendar month.—§ 17.

Penalty for sending abroad newspapers not duly stamped, 50*l.*—§ 18.

Justices may grant warrants to search for unstamped newspapers, and to seize presses, &c. used in printing the same; and on refusal of admittance, officers may break open doors, &c. Persons resisting officers liable to a penalty of 20*l.*—§§ 22, 23.

Influence of the Reduction of the Duty in 1836.—The reduction of the price of newspapers from 7*d.* to 5*d.* occasioned a great increase in the demand for the old or established papers; and a considerable number of new weekly papers also started into existence after the reduction of the duty in the metropolis and throughout the country. Hitherto, however, with one exception, no new daily paper has been established in the metropolis.

Newspaper Act of 1855.—But a still further and most important change in the regulations as to newspapers has been effected by the Act of this year (1855), the 18 Vict. c. 27. This Act exempts newspapers or periodical publications, not transmitted by post, from all charge for duty; but the existing duty, and the other arrangements referred to above, are still kept up in the case of newspapers sent by post. Inasmuch however, as newspapers may be readily transmitted between the principal places in the U. K. through private channels, it is probable that the post will be but little resorted to in time to come, except in the case of newspapers sent to the country, or to places out of the way of the great lines of communication. And hence, no doubt, the abolition of the duty on the great majority of newspapers will be the principal immediate effect of the new system. We beg to annex the following abstract of the Act referred to.

Not compulsory to print Newspapers on Stamps.—From and after 14 days from the passing of this Act it shall not be compulsory (except for the purpose of free transmission by the post) to print any newspaper on paper stamped for denoting the duties imposed by law on newspapers, and no person

shall be subject or liable to any penalty or forfeiture for printing, publishing, selling, or having in his possession any unstamped newspaper.—§ 1.

Periodical Publications printed on Stamps to be transmitted by Post free of Postage.—Every periodical publication herein-after mentioned which shall be printed within the U. K. on paper stamped for denoting the rate of duty now imposed by law on newspapers shall be entitled to the like privileges of transmission and re-transmission by the post between places in the U. K., either postage-free or otherwise, on the same terms and conditions and under and subject to the like rules and regulations as newspapers duly stamped are now entitled and subject to under any Act or Acts in force, but under and subject nevertheless to the terms and conditions contained in this Act.—§ 2.

Periodical Publications entitled to free Transmission by Post to be printed under specified Limitations and Conditions.—Every periodical publication to be entitled to any such privilege as aforesaid shall be printed and published at intervals not exceeding 31 days between any two consecutive parts or numbers of such publication, and shall be subject to the same limitations and restrictions with respect to the number of sheets or pieces of paper whereon the same shall be printed, and with respect to the superficies or dimensions of the letter-press thereof, as by any Act or Acts now in force are enacted or imposed with respect to newspapers and supplements thereto; and every such periodical publication shall be entitled to such privilege only on the terms and conditions following; viz. one of the sheets or pieces of paper on which the same shall be printed shall be stamped with an appropriate die, denoting the stamp duty imposed by law on a newspaper printed on the like number of sheets or pieces of paper and of the like dimensions with respect to the superficies of the letter-press thereof; and on the top of every page of such publication shall be printed the title thereof, and the date of publishing the same; and such periodical publication at the time when the same shall be posted shall be folded in such manner that the whole of the stamp denoting the said duty shall be exposed to view, and be distinctly visible on the outside thereof; also such periodical publication shall not be printed on pasteboard or cardboard, or on two or more pieces or thicknesses of paper pasted together, nor shall any pasteboard, cardboard, or such pasted paper be transmitted by post with any such periodical publication either as a back cover thereto, or otherwise.—§ 3.

Paper to be stamped for such periodical Publications, &c.—It shall be lawful for the proprietor or printer of any such periodical publication to send to the commissioners of Inland Revenue, or to such officer as they shall appoint or direct in that behalf, any quantity of paper to be stamped with an appropriate die, to be provided in the manner directed by the Act 6 & 7 Will. 4. c. 76. s. 3. for denoting the rate of stamp duty chargeable on newspapers; and upon payment to the proper officer of the full amount of the stamps required to be impressed on such paper, the said commissioners shall cause the same to be stamped accordingly: provided always, that there shall be allowed in Ireland, in respect of such appropriated stamps as aforesaid for any periodical publication which shall be printed and published only in Ireland, the same rate of discount as by the said Act is directed to be allowed on the purchase of stamps for the printing of newspapers in Ireland.—§ 4.

Periodical Publications to be posted within 15 Days after Publication.—Every periodical publication, posted in the U.K., to be entitled to the privilege of transmission by the post between places in the U.K., under the provisions of this Act, shall be put into a post office within 15 days next after the day on which the same shall be published; the day of publication to be determined by the date of such publication.—§ 5.

Questions as to periodical Publications, how determined.—In all cases in which a question shall arise whether a printed paper is entitled to the privilege of a periodical publication, so far as respects the transmission thereof by the post under the provisions of this Act, the question shall be referred to the determination of the Postmaster General, whose decision, with the consent of the commissioners of the Treasury, shall be final.—§ 6.

Newspapers may be registered at the General Post Office.—Upon the Postmaster General being satisfied that any printed publication is a newspaper, or entitled to the privileges of a newspaper, within the meaning of the treaties and arrangements with foreign powers and colonial governments, it shall be lawful for the proprietor or printer of such newspaper or publication, if he think fit, to register the same at the general post office in London, in such form and with such particulars relating to the same, and subject to the payment of such fees, not exceeding five shillings respectively, as well on registration as afterwards periodically for being continued on the register, as the Postmaster General, with consent of the Treasury, shall from time to time direct or require in that behalf; and thereupon such newspaper or publication, being printed on paper duly stamped with an appropriate die under the provisions of this Act, shall be entitled to all the privileges and advantages secured to newspapers by any such treaties and arrangements.—§ 7.

Transmission by Post of printed Papers to Foreign Countries.—It shall be lawful for the Treasury, by warrant under their hands, to allow any printed newspaper (British, colonial, or foreign) to be transmitted by the post between places in the U. K. and colonies or foreign countries, or between any ports or places beyond the sea (whether through the U. K. or not), either free of postage or subject to such rates of postage not exceeding 2*d.* for each newspaper, irrespective of any foreign or colonial postage, as the Treasury, or Postmaster General with their consent, shall from time to time think fit; and as a condition to any British newspaper being transmitted by the post to any place out of the U. K., the same shall be printed on paper duly stamped with an appropriate die under the provisions of this Act, and the Treasury or Postmaster General may require such newspaper to be registered at the general post office in London in the form and with the particulars and subject to the payment of the fees mentioned in last section.—§ 8.

Power to the Postmaster General and Treasury to make Regulations for carrying the Act into effect.—It shall be lawful for the Postmaster General, with the consent of the Treasury, at any time or times hereafter to make and issue such orders, regulations, conditions, and restrictions as he shall deem to be necessary or expedient for the purpose of regulating the receipt, transmission, and delivery by post of periodical publications under the provisions of this Act, or for preventing or detecting frauds or abuses in relation thereto, and for giving effect to the purposes of this Act; and it shall also be lawful for the said Postmaster General, with the like consent, from time to time to rescind or revoke all or any such orders, regulations, conditions, and restrictions, and to make and issue any new ones in lieu thereof.—§ 9.

Periodical Publications sent by Post not in conformity with this Act to be charged Letter Rates of Postage.—Periodical publications sent by post otherwise than in conformity with the terms, conditions, and regulations established under the authority of this Act may be detained by the Postmaster General, and any officer of the post office; and after being opened, the same shall be either returned to the senders thereof, or forwarded to the place of their destination charged with the like rates of postage as if the same were letters transmitted by the post: provided always, that it shall be lawful for the Treasury, by warrant under their hands, to authorise the Postmaster General to charge in any such case any such less rate of postage as to him shall seem fit.—§ 10.

London Gazette to be Evidence of the issuing of Warrants or Orders.—Any printed copy of the London Gazette in which any warrant or order issued or made under or by virtue of this Act, or purporting so to be, shall be published, shall be admitted as evidence by all courts, judges, justices, and others of such warrant or order, and of the due making and issuing thereof, and of the contents thereof, without any further or other proof of such warrant or order, or of the matters therein contained.—§ 11.

Interpretation of Terms.—The term "periodical publication" used in this Act shall be construed to mean and include a newspaper as defined by the Acts in force relating to the stamp duties on newspapers, and every printed literary work or paper, printed and published periodically, or in parts or

numbers, at intervals not exceeding 31 days between any two consecutive papers, parts, or numbers of such literary work or paper; and for all the purposes of this Act the islands of Guernsey, Jersey, Alderney, Sark, and the Isle of Man shall respectively be deemed to be parts of the U. K.—§ 12.

It would be premature to speculate with much confidence in regard to the results of this important measure. But we doubt whether it will have the beneficial influence which many have anticipated. It was contended in 1836, when the duty on newspapers was reduced from 3½*d.* to 1*d.*, that various advantages would result from this reduction; that the clandestine circulation of cheap journals advocating dangerous doctrines would cease; and that the stigma attached to low-priced journals in the public estimation being removed, men of ability and attainments would find it as much for their advantage to write in them as in the higher-priced journals. These expectations have not been realised; and we much doubt whether the circulation of low-priced political journals can ever be of advantage. Such papers are, speaking generally, addressed to the lower and poorer classes of the community; and their writers usually find it more for their advantage to flatter the prejudices entertained by their readers, and to espouse their peculiar views, how inconsistent soever these may be with the interests of society in general, than to inculcate sounder though less popular principles. Hence the questionable character of the greater number of the low-priced papers, or, at least, of such of them as are read by the lower orders. This, perhaps, may be a necessary evil in a highly advanced country like this; but whether it be so or not, there can be no doubt of its existence, and of its magnitude.

It has sometimes been thought singular that that division of subjects which has been introduced into most other things has not been introduced amongst newspapers. Instead of having all sorts of matter crammed into the same journal, it might be presumed that the better plan would be to have all topics of considerable interest separately treated in papers appropriated to them only, and conducted by persons fully conversant with their principles and details. Under the present omnivorous system, individuals who care nothing for the theatre are, notwithstanding, unable to procure a paper in which it does not occupy a prominent place; and those who cannot distinguish one tune from another have daily served up to them long dissertations on concerts, operas, oratorios, and so forth. But, how desirable soever in some respects, the plan of appropriating particular papers to particular subjects does not appear to be at all suited to the public taste. In a well conducted daily paper, like *The Times*, ably written articles on all subjects of interest are brought together under the reader's notice, who may read them all, or such only as he pleases. This is incomparably more convenient than to have to hunt for different articles among a variety of journals; and is, in fact, the only plan calculated to meet the wants and exigencies of the public.

Impolicy of imposing a Postage on Newspapers.—The duties, now substantially repealed produced, in 1853, 412,220*l.* nett, no inconsiderable sum in a period of war. In point of fact, however, they could hardly be called duties, and ought rather to have been regarded as a payment for the trouble and expense attending the conveyance and distribution of newspapers by post. But supposing such to be the case, it was argued that the duty should be so limited, that is, that it should only be imposed on papers carried by the post. Matters of this sort are not, however, to be decided by mere logical considerations. The effect of the new plan is to confine, in a greater or less degree according to circumstances, the circulation of newspapers to the districts within which they are published; and this certainly is not a desirable object. Hitherto *The Times* and other London journals displaying the greatest talent, and embracing the most varied information, have been distributed all over the country at about the same price as the local and inferior journals. But under the new plan the charge for conveyance, or it may be postage, being added to the price of the metropolitan journals, they will be dearer than the local papers, and people in many, or rather perhaps in the majority of instances, will be disposed to prefer the low-priced though inferior journal published at their door, to the superior but higher priced journal of the capital. If this should turn out to be the case, it will be a serious disadvantage; and by depreciating the quality of the journals circulating over the country, and fostering local prejudices, will far more than neutralise the advantages which it is presumed will result, under the new plan, from the establishment of low-priced papers. These advantages are, indeed, of a very doubtful description. It is true that many of the inferior papers now to be met with inculcate pernicious doctrines. But it is by no means clear that their influence will be in any degree lessened by the new system. On the contrary it may not improbably be increased. The late duty affected them to the same extent that it affected other descriptions of papers; and as they circulated when charged with this burden, it appears reasonable to suppose that they will circulate still more extensively when relieved from it. On the whole, therefore, we anticipate little or no advantage from the new plan. But we are, at the same time, ready to admit that no system of this sort can be safely judged *à priori*; and that the results of experience may differ very widely from those of theory.

Piracy in Newspapers.—The great difficulty under which the leading journals are at present placed is the want of any available copyright in the news or in the articles which they supply. The important information collected by the agents for *The Times* in all parts of the world, and the able disquisitions in that and other journals, may be (and no doubt will be) published, in an hour or two after their first edition in London, in low-priced journals in Manchester, Liverpool, Glasgow, and so forth. This is a gross abuse. And though it be difficult to deal with, it seems pretty evident that if it be not put down, it can hardly fail, by robbing the Metropolitan journals of great part of the advantages derived from their extensive connections and vast expenditure, to make them less anxious to cater for their readers, and so to degrade the quality as well as the character of the press.

Notices of Newspapers.—The history of newspapers, and of periodical literature in general, remains to be written; and were the task executed by an individual of competent ability, and with due care, it would be a most interesting and important work. It appears, from the researches of Mr. Chalmers, that the first newspaper published in modern Europe made its appearance at Venice, in 1536; but the jealousy of the government would not allow of its being printed; so that, for many years, it was circulated in manuscript! It was called *Gazetta*, from a small Venetian coin of that name, for which it was usually exchanged (*Camusat, Histoire des Journaux*, i. 119.) Newspapers were first issued in England by authority during the alarm occasioned by the approach of the *Armada* to our shores; in order as was stated, by giving real information, to allay the general anxiety, and to hinder the dissemination of false and exaggerated statements. From this æra, newspapers, of one sort or other, have, with a few intermissions, generally appeared in London; sometimes at regular, and sometimes at irregular intervals. During the civil wars, both parties had their newspapers. A newspaper was published in Scotland, under the auspices of Cromwell, in 1652. The Caledonian Mercury was, however, the earliest of the Scotch newspapers of native manufacture; it first appeared at Edinburgh, under the title of *Mercurius Caledonius*, in 1660; but its publication was soon afterwards interrupted. In 1715, a newspaper was, for the first time, attempted in Glasgow.

The *Daily Courant*, the first of the daily newspapers published in Great Britain, made its appearance in London in the early part of the reign of Queen Anne.—(See the *Life of Ruddiman*, pp. 102—121.)

From the Stamp Office accounts, it appears that the number of newspapers sold annually in England, during the three years ending with 1753, was 7,411,757; in 1760, 9,461,790; in 1790, 14,035,639; in 1792, 15,005,760.

American Newspapers. — The increase of newspapers in the U. States has been a good deal more rapid than in England; a consequence, partly, no doubt, of the greater increase of population in the Union, but more, probably, of their freedom from taxation, and of the violence of party contests.

The whole number of newspapers and periodical publications in the United States on the 1st of June, 1850, amounted, according to the official returns, to about 2,800. Of these, 2,494 were fully reported upon, while the particulars with respect to the others were in part estimated.

From these returns, &c. it appears that the aggregate circulation of papers and other publications was about 5,000,000; and that the entire number of copies printed annually in the United States, amounted to about 422,600,000. The following table shows the number of daily, weekly, monthly, and other issues, with the aggregate circulation of each class: —

	No.	Circulation.	No. of Copies printed annually.		No.	Circulation.	No. of Copies printed annually.
Daily Journals	350	750,000	235,000,000	Monthly	100	900,000	10,800,000
Tri-weekly	150	75,000	11,700,000	Quarterly	25	20,000	80,000
Semi-weekly	125	80,000	8,320,000				
Weekly	2,000	2,875,000	149,500,000	Total	2,800	5,000,000	422,600,000
Semi-monthly	50	300,000	7,200,000				

Four hundred and twenty-four journals were issued in the New England States; 876 in the Middle States; 716 in the Southern States; and 784 in the Western States. Of the whole 2,800 publications about 2,200 were newspapers, properly so called; the residue being scientific, religious and educational journals. The average circulation of the mere papers was 1,785. There was one publication for every 7,161 free inhabitants in the United States and territories.

We are not, however, to estimate the influence of newspaper literature by its quantity only, but must have regard also to its *quality*. The latter is, indeed, the principal thing to be attended to; and in whatever degree the Americans may exceed us in the number, they certainly are much below us in the quality, of their newspapers. Speaking generally, we do not hesitate to say that the newspaper press is discreditable to the union. The journals indulge, with comparatively few exceptions, in offensive personalities. Instead of examining the principles of the measures brought forward, they assail the character and misrepresent the motives of those by whom they are introduced. It is impossible, we be-

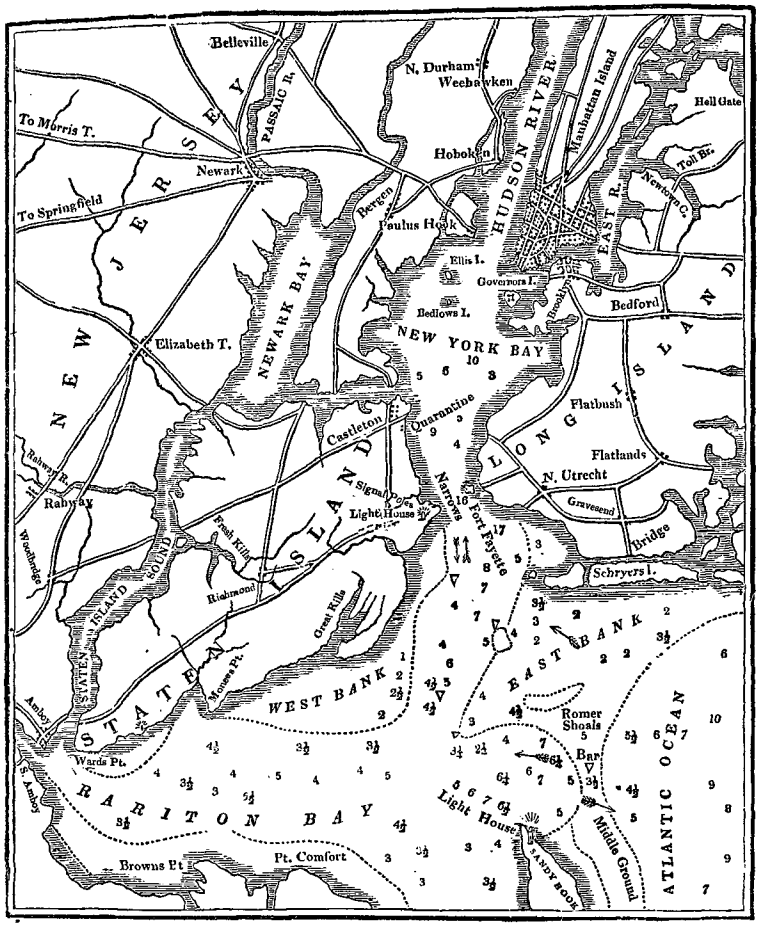
lieve, to name an individual, who has attained to any high office in the U. States, or to consideration in Congress, who has not been libelled, traduced, and calumniated by a large portion of the press, to a degree that can hardly be imagined. The magnitude of the evil will, probably, lead to its cure. No people, with any pretensions to instruction and morality, can patronise a press whose principal features are misrepresentation, exaggeration, and abuse.

NEW YORK, the capital of the state of that name, the commercial metropolis of the U. States, and one of the greatest cities of modern times, on the southern extremity of Manhattan Island, at the point of confluence of the Hudson River, which separates Manhattan from New Jersey, with East River, which separates it from Long Island, lat. 40° 42′ N., lon. 74° 8′ W. New York bay, or inner harbour, is one of the most capacious and finest in the world; it is completely land-locked, and affords the best anchorage. The entrance to the bay through the Narrows is extremely beautiful. On each side, the shore, though wooded down to the water's edge, is thickly studded with farms, villages, and country seats. At the upper end are seen the spires of the city; and in the distance the bold precipitous banks of the Hudson. From New York to the bar between Sandy Hook Point and Schryer's Island (the division between the outer bay or harbour and the Atlantic) is about 17 miles. Fortifications have been erected at the Narrows, Governor's Island, and other places, for the defence of the city and shipping. The wood-cut on the opposite page represents the city and bay of New York, and the surrounding country.

The Hudson river was first explored in 1609, by the famous English navigator whose name it bears, then in the service of the West India Company of Holland. In 1612, New Amsterdam, now New York, was founded by the Dutch, as a convenient station for the fur trade. In 1664, it was taken by the English. The Dutch again recovered possession of it in 1673; but it was retaken by the English in the following year, and continued in their occupation till the termination of the revolutionary war.

New York has increased faster than any other city of the United States. In 1699 it contained 6,000 inhabitants. In 1774, previously to the commencement of the war of independence, the population amounted to 22,750. During the war the population continued stationary; but since 1783, its increase has been quite extraordinary. In 1790, the population amounted to 33,131; in 1800, to 60,489; in 1820, to 123,706; in 1830, to above 213,000; in 1840, to 312,710; and in 1850, to 515,507. This, however, is exc. of the pop. of Brooklyn, which, in 1850, amounted to 96,838, and is as much a part of N. York as Birkenhead is of Liverpool. At present (1858) the pop. of N. York and its suburbs is said to exceed 1,000,000, viz. N. York proper, 700,000, Brooklyn, 200,000, and Hoboken, &c., upwards of 100,000. Originally the houses were mostly of wood, and the streets narrow and confined. In these particulars, however, a vast improvement has taken place during this century; most part of the old houses having been pulled down and rebuilt with brick. The new streets, which are broad, and intersect each other at right angles, are well paved and lighted. Broadway, the principal street, is one of the largest and finest in the world. Many of the public buildings are commodious and elegant. The pools, that were formerly abundant in the city and its vicinity, have been completely filled up; a measure that has done much to improve the health of the population. In respect of cleanliness, however, New York, though much improved, is still rather deficient. Formerly there was hardly such a thing as a sink or common sewer in the whole city; the night-soil and filth were collected in pits of which there was one in every house, and being conveyed to the nearest quays, were thrown into the water; and as these are made of timber, with many projections, a great deal of filth was retained about them, producing, in hot weather, an abominable stench. But in these respects a great amendment has been effected; and the deficiency of water, under which the city formerly laboured, has been completely obviated by the construction of the Croton aqueduct, about 40½ m. in length, a work worthy of being ranked with the noblest of the old Roman aqueducts. It is carried over the Haarlem river (separating Manhattan island from the continent), on a bridge of stone of 14 arches, 1,450 ft. in length. The yellow fever, by which New York has sometimes been visited, uniformly breaks out in the lower and dirtiest part of the town; and seldom, indeed, extends to the new and more elevated streets. It is now much less prevalent than formerly; and the general opinion seems to be, that were stone substituted for timber in the quays, sewers generally constructed, and proper regulations enforced as to cleanliness, the scourge would entirely disappear.

New York is indebted, for her wonderful increase, to her admirable situation, which has rendered her the greatest emporium of the New World. The rise of the tide is about 6 feet; and even at ebb, there is 21 feet water on the bar; and the water in the outer and inner bays, and in the river, is so deep, that ships of the largest burden lie close to the quays, and may proceed to a great distance up the river. The navigation of the bay is rarely impeded by ice. The great strength of the tide, and the vicinity of the ocean, keep it generally open, even when the Chesapeake and Delaware bays are frozen over. The influence of the tides is felt in the Hudson as far as Troy, 160 miles above New York, affording peculiar facilities for its navigation. These natural advantages have been vastly extended by a system of canals, which has connected the Hudson not merely with Lake Ontario and Lake Erie, but with the Ohio river, and consequently with the Mississippi and the Gulph of Mexico! So prodigious a command of internal navigation is not enjoyed by any other city, with the exception of New Orleans; but the readier access to the port of New York, the greater salubrity of the climate, and her situation in the most industrious



Entrance to Harbour, Light-houses, &c.—The course in entering the harbour of New York is nearly due W. from the outermost white buoy on the bar, till the buoy on the S. W. point of the east bank be passed, and then nearly due N. The navigation is extremely easy. Pilots generally board vessels without the bar; for, otherwise, they are only entitled to half fees. Were it not for fear of vitiating insurances, their services would seldom be required.—(See *Rates of Pilotage, post.*) The light-house near the extremity of the long, low, narrow tongue of land, projecting from the New Jersey shore, called Sandy Hook, is in lat. 40° 28′ N., lon. 74° 8′ W. It is fitted up with a very powerful fixed light, which, in clear weather, may be seen by vessels coming from the westward 10 leagues off. But, from its position, it is not readily discovered by ships coming from the S. till too near. To obviate this inconvenience, a floating light was moored about 7 miles E. from Sandy Hook Point. In 1828, however, 2 light-houses were erected on Neversink hills, nearly 4 miles S. by E. from Sandy Hook. They are 300 feet apart; the most northerly being furnished with a fixed, and the other with a revolving light, both of great power. The lights are elevated 250 feet above the level of the sea; and may be seen, in clear weather, in all directions, from 40 to 50 miles. Since they were fitted up, the floating light has been discontinued. Vessels load and unload at the wharfs on both sides the city.

part of the Union, where slavery is abolished, give her advantages over her southern rival, which, it is most probable, will secure her continued preponderance.

Trade, &c. — The commerce of New York is of vast extent. The value of the merchandise annually loaded and unloaded in the port is estimated at from 450 to 500 millions of dollars; and in the busy season the number of vessels in it varies from 1,000 to 1,500, exclusive of about 250 steamers. The number of arrivals from foreign ports amounted, in 1858, to 8,957, and the coasting arrivals exceed 8,000. The total value of the imports into the United States in the year ending the 30th June, 1858, amounted to 282,613,150 dolls., of which no less than 178,476,736 dolls. were imported into New York. The imports comprise an infinite variety of articles. The principal are cottons, woollens, linens, iron, hardware and cutlery, earthenware, brass and

copper manufactures, salt, &c., from Great Britain; silk, wine, brandy, &c., from France and Spain; sugar and coffee from the Havannah and Brazil; tea from China; with spices, indigo, cochineal, dye woods, &c. &c. The value of the exports from the State of New York, and mostly from this city, in the year ending the 30th of June, 1858, amounted to 108,340,924 dolls., being 1-3rd of the total exports from the U. States. The exports principally consist of wheat and wheat flour, corn, rice, and cotton; bullion; beef, pork, butter, dried fish, and all sorts of provisions; furs, tobacco, coarse cottons, and other manufactured goods, lumber, &c. The great excess of imports into New York over the exports is accounted for by the fact, that while by far the larger portion of the articles of export from the Western states are sent down the Mississippi, to be shipped at New Orleans, the greater part of the more valuable articles brought from abroad, and destined for the consumption of the same states, is imported into New York.

The shipping of New York is far greater than that of any other port, London not excepted. The total tonnage belonging to the port on the 30th of Sept. 1838, amounted to 400,971 tons; and on the 30th of June, 1858, it had increased to 1,432,705 tons, being about 1-4th part of the entire tonnage of the United States, and incomparably the greatest amount of shipping that has ever belonged to any single port. Subjoined are some statements respecting the navigation, &c., of New York, in some recent years: —

Both the import and export trade of N. York and of the Union generally had been completely overdone in 1856, and the earlier part of 1857, and hence the crisis of the latter year, and the falling off in the trade of 1858. That falling off can, however, be temporary only. The increase of population and wealth in the U. States is such that their trade must, if not disturbed by prohibitive regulations, be in a short while greater than ever.

The Receipts for Cash Duties at the port of N. York, for 1857, were 10,000,000 dollars less than for the previous year, owing to the change in the tariff, and the great falling off in the quantity of goods thrown upon the market—For, while the total value of foreign goods entered at the port during the year 1857 (exclusive of specie), was about 218,000,000 dollars, the value of those that were sold amounted to only about 185,000,000 dollars. In 1858 the sales exceeded the imports; but as these were comparatively small the duties were about 9,000,000 dollars less than in 1857.

Of the total value of the imports into N. York in 1857, amounting to 178,475,736 dollars, those brought in American bottoms amounted to 123,428,283 dollars.

Coastwise Arrivals and Clearances.— Inasmuch as vessels engaged in this trade are not obliged to record their entry or clearance, except they have foreign goods or spirits on board, the official entries and clearances afford no test of, and are far from indicating, the actual amount of the trade. But as the coasting vessels which leave N. York have much more frequently foreign goods on board than those by which it is entered, the official clearances are much more numerous than the entries. Altogether the arrivals and departures coastwise may amount to about 8,000 each way. The coasting trade of N. York is, in fact, quite immense.

Regulations as to Passengers arriving at New York.—On the arrival of passengers, an entry must be made at the Custom-house, of their names, clothes, implements of trade or profession (all of which are exempt from duty), and an oath taken respecting them; the form of which, and the entry, may be had at the office gratis. Cabin passengers make this entry themselves, and pay 20 cents each for a permit; on exhibiting which to the officer on board, they are allowed to remove their baggage after it has been inspected. Only 1 entry and permit is necessary for a *family*, and only 20 cents demanded, whatever may be the number of the family. Remains of sea stores, such as tea, sugar, foreign spirits and wines, are liable to pay duties; but unless these are of great bulk or quantity, they are generally allowed to pass free.

An entry is usually made by the master of the vessel of steerage passengers and their baggage; they pay each 20 cents for a permit. When entry is made by any person not the owner, he gives bond for payment of the duties, if any; and if, after entry is made at the Custom-house, and the oath taken, any article is found belonging to a passenger, liable to pay duty, *not specified in the entry*, it is forfeited, and the person in whose baggage the article is found subjected in treble the value.

Besides making entry at the Custom-house, it is provided by a law of the State, that every master of a vessel arriving from a foreign country, or from any other port of the U. States, "shall within 24 hours after entering his vessel at the Custom-house, make a report in writing, on oath, to the mayor, and in case of his sickness or absence, to the recorder of the said city, of the name, age, and occupation, of every person who shall have been brought as passenger in such ship or vessel on her last voyage, upon pain of forfeiting, for every neglect or omission to make such report, the sum of 75 dollars for every alien, and the sum of 50 dollars for every other person neglected to be so reported as aforesaid."

Masters of ships bringing passengers to New York must also pay a dollar on account of each passenger to the corporation, as commutation money, or give bond that none of them shall become chargeable on the city poor rates for the space of two years. They almost uniformly prefer paying the commutation.

Lines of Packets.— The establishment of regular lines of packets from New York to the principal foreign and domestic ports produced a new æra in the commerce of the city, and has redounded equally to the benefit of the enterprising individuals by whom they were projected, and the public. They consist partly of steam, and partly of sailing ships, and belong sometimes to the merchants of New York and sometimes to those of the ports with which she is connected. Her principal intercourse is carried on with Liverpool; but, as the trader will find ample information with respect to it in the article on Liverpool in this work (*antè*, p. 517,), its repetition here would be worse than useless. New York is, also, connected by lines of packet ships with London, Havre, Hamburg, Bremen, Marseilles, and other European ports; with Rio de Janeiro and Bahia in South America; and with Boston, Philadelphia,

New Orleans, and all the principal ports of the United States. And in addition to the regular traders the ships of New York, which are mostly all admirably built and fitted out, are to be found in every port and on every sea, wherever, in fact, it is possible for skill and enterprise to obtain a footing. In this respect, at all events, the Americans have not degenerated. They continue to manifest, in a great degree, all the perseverance, sagacity, and hardihood, in mercantile and naval matters, which have so long and so honourably distinguished their ancestors.

The Banks of New York are all, or mostly all, organised on the security system, that is, they are obliged to deposit security in the hands of a government officer, proportioned to the amount of the notes they are empowered to issue. At first sight this plan appears to be well-fitted to prevent over-issue and abuse: but such is not really the case, and nowhere in the Union has the abuse of banking been carried to a greater extent, or been more injurious than in this city. This, however, is a subject that has been fully discussed in its proper place in this work; and we beg to refer such of our readers as may wish for ample information with respect to it, to the Section entitled "Banks in the U. States, in the art. BANKING (*antè*, p. 113.)

State of the Principal Banks of N. York, showing their Capital and half-yearly Dividends, in 1856, 1857, and 1858.

† Charter expired, January 1, 1857.

SALES BY AUCTION.—The practice of selling goods, particularly those imported from abroad, by auction, is of long standing in New York, and is carried to a very great extent. Auctioneers are appointed by the senate, on the nomination of the governor.

Abstract of the principal Provisions of the Law, concerning Auctions.

The duties are—

1. On wines and ardent spirits, foreign or domestic, 2 per cent,
2. On goods imported from beyond the Cape of Good Hope, and sold in packages, bales, &c., as imported, 1 per cent.
3. On all other articles, subject to duties, 1½ per cent.

The following articles are not subject to duties:—

1. Ships and vessels,
2. Utensils of husbandry, horses, neat cattle, hogs, and sheep.
3. Articles grown, produced, or manufactured in this state, except distilled spirits.
4. All fabrics of cotton, wool, hemp, and flax, manufactured within the jurisdiction of the United States.

Goods are exempted from auction duties,—

1. When they belong to the United States or this State.
2. When sold by the authority of a court, or when seized by a public officer on account of any forfeiture or penalty, or under a distress for rent.
3. The effects of a deceased person sold by executors or administrators, or by a person authorised by a surrogate.
4. The effects of a bankrupt or insolvent sold by his assignees, appointed pursuant to law, or by a general assignment for the benefit of all his creditors.
5. Goods damaged at sea and sold within 20 days after being landed, for the owners or insurers.

Any citizen of this State may sell at auction (except in the city of New York) all such goods as are not subject to duties. But in the city of New York, or where the goods pay duties, the sale must be by an authorised auctioneer, his partner, or clerk. And any person selling contrary to the said provisions is guilty of a misdemeanour.

When an auctioneer cannot attend an auction by *sickness*, by *duty as a fireman*, by *military orders*, or *necessary attendance in a court of justice*, or when he is *temporarily* absent from the place for which he is appointed, he may employ a partner to attend in his behalf.

He must give bond to the people of this State, with 2 freehold sureties, conditioned in the penalty of 5,000 dollars, for the payment of the duties imposed by law and accruing on the sales. The penalty of selling without the bond is 125 dollars for each article offered for sale.

No auctioneer in any city shall at the same time have more

than 1 house or store for holding his auctions, and shall, before entering on his office, designate in a writing, to be filed with the clerk of the city, such house or store, and his partner or partners. But goods sold in the packages in which they were imported, furniture, and such bulky articles as have usually been sold in warehouses, in the streets, or on the wharfs, need not be sold in the house or store designated in such writing, if such sales be advertised at least 2 days previously, in 1 or more newspapers.

Auctioneers are to receive 2½ per cent. on the amount of all sales, unless by previous agreement in writing; and for *demanding* and receiving an unlawful commission, shall forfeit 250 dollars, and refund the monies so received.

No auctioneer, on the same day and at the same place where his public auction shall be held, nor any other person at the same time and place, shall sell at private sale any goods liable to auction duties, under penalty of forfeiting their price.

Every auctioneer shall make out in writing a quarterly account, dated on the 1st days of April, July, October, and January in the year for which he is appointed, stating minutely —

1. The sum for which any goods shall have been sold at every auction held by or for him, from the time of his giving bond, or from the date of his last quarterly account.
2. The days on which sales were so made, and the amount of each day's sale, designating the sales made by himself, or in his presence, and those made in his absence, by his partner or clerk, and the causes of his absence.
3. The amount of all private sales made by himself or his partner, and the times thereof.
4. The amount of duties chargeable on all sales made.

Every such account shall, within 20 days after its date, be exhibited, by auctioneers for a city, to the mayor or recorder; and if by an auctioneer for a county, to a county judge, and be verified by oath. Every partner of an auctioneer, and every clerk who has made any sales, shall also swear to his belief in the truth and justice of every particular of such account.

The State duties (together with the addition of 2½ per cent. on the whole amount of them) are to be paid within 10 days after exhibiting such account.

Any deceit or fraud in violating any provision of the law respecting auctioneers, is made a misdemeanour, and subjects the offending party to the payment of *treble* damages to the party injured.

COINS.—*Gold eagle.*—This, with its subdivisions, is the only American gold coin. By the mint regulations of the United States, the eagle, which is the equivalent of 10 dollars, contained, previously to the 31st of July, 1834, 270 grains of standard gold, viz. 246 grains pure, and 24 grains alloy. But, by an act of Congress, which came into operation at the above date, the weight of the eagle was reduced to 258 grains, of which 232 are pure, and 26 grains alloy. In consequence of this alteration, the sovereign, that was formerly worth 4 dollars 57 cents, is now worth 4 dollars 87 cents, and is received by the Americans at this rate.

We do not know whether it was the object of the American government, in enacting this law, to substitute a gold in the place of a silver currency; but it has, concurrently with the discovery of the Californian gold-fields, had that effect. Under the former system, silver was over-valued in the American mint as compared with gold; and, as it consequently became everybody's interest to pay his debts in silver rather than in gold, the latter was nearly banished from circulation, precisely in the same way that the over-valuation of gold in the British mint banished all silver coins of full weight from this country, and that the over-valuation of silver in the French mint banished gold.—(*Antè*, p. 322.) Under the present American system, gold is said to be over-valued from 1¼ to 1⅓ per cent., so that an individual who has to pay a debt of 100*l.*, and who employs metallic money for that purpose, will save from 25*s.* to 30*s.* by using gold rather than silver.

Value of Foreign Gold Coins in the Currency of the U. States.—It was ordered by an act of Congress, passed at the same time with the New Mint Act, that there "shall pass current as money, and be receivable in all payments, by weight, for the payment of all debts and demands, from and after the 31st day of July, 1834," viz.: 1. The gold coins of Great Britain, Portugal, and Brazil, of not less than 22 carats fine, at the rate of 93 8-10 cents per pennyweight; 2. The gold coins of France, 9-10ths fine, at the rate of 93 1-10 cents per pennyweight; and 3. The gold coins of Spain, of the fineness of 20 carats 3 7-16 grains, at the rate of 89 8-10 cents per pennyweight. On this principle the following table has been calculated:—

Gold Coins of Great Britain, Portugal, & Brazil, 22 Carats fine.

	Weight.		Contents in pure gold.	Value in U. S. currency, at 93 8-10 cts. per dwt.			Value estimated by the quantity of pure gold compared with fine eagle of 232 grs.

* To those who wish perfect accuracy, it may be observed that the quantity of pure gold in the sovereign is 113 18-11, 214 grains, and that the true value of the sovereign, compared with the new eagle of 232 grains, is 94 87-7 100. This is also the true par of exchange between the United States and London, and is equal to a premium of 9 7-10 per cent., as near as can be calculated, on the nominal par of 4 44 or 109 7-10 for 100.

Previously to 1837 standard silver in the U. States was 1485 parts pure to 179 parts alloy. But it was then determined to make the standard of silver as well as of gold 9 parts pure to 1 part alloy; and this was effected by reducing the copper or alloy in the dollar 3½ grs., making its weight 412·5 instead of 416 grains. In consequence of the over-valuation of gold with respect to silver previously referred to, no silver coins of the full weight would latterly remain in circulation. To obviate the inconveniences thence arising Congress has, in the course of the present year (1853), issued half dollars which contain only 192 gr. standard silver, being a reduction of very near 7 per cent., and ¼ and ⅛ dollars in the same proportion. But as these coins are legal tender to the extent of only 5 dols., and as the weight of the dollar itself has not been diminished, there is no degradation of the standard. And provided the Treasury do not issue the new coins in excess, they will most likely remain in circulation, and serve as a subsidiary currency.

Double louis, coined since 1786 (single in proportion) - -	9	0	212·6	9	15	4	9	16	3
Double napoleon (single in proportion) -	8	7	179	7	71	8	7	71	5
New louis - -	4	3 1-2	82·5	3	85	9	3	85	7

NOTE.—The double louis, louis, and demi-louis, coined before 1786, not being 9-10ths fine, are not included in the table, because they are not legal tenders. Neither are the double and single napoleon, or the new louis, exactly 9-10ths fine, but the deficiency is so very small that it is believed it is covered by what is called the remedy of the mint.

Gold Coins of Spain, 20 Carats 3 7-16 Grains fine.

The following tables, showing the weight and fineness of the principal gold and silver coins of foreign countries, and their values in the existing currency of the U. States are at present of the highest authority. They have been computed by Mr. Snowden, the intelligent director of the Mint of the U. States, and were issued on the 9th November, 1858. Silver is taken in them at 121 cents per oz., instead of 122½ cents per oz., at which it was formerly estimated.

N.B.—An Act of Congress, approved 21st February, 1857, directs that the pieces known as the 1-4th 1 8th, and 1-16th of the Spanish Pillar dollar and the Mexican dollar shall be receivable at the Treasury of the U. States at 20, 10, and 5 cents respectively; and that they shall not be reissued, but recoined at the Mint.

Custom-House Regulations.—Vessels must be reported to the collector by the master 24 hours after arrival; must come to a full entry 48 hours after arrival, at which time the commander swears to a detailed account of his cargo, stores, and passengers, and that he has deposited all letters in the post-office, except such as are for his ship's husband, at which time he must also deposit the register, clearance, and cockets in the Custom-house.

Warehousing.—There is no warehousing system, but goods are received into the public stores, where they are allowed to remain 9 months at the risk and expense (for fees of cartage, labourage and stowage, as fixed by the Chamber of Commerce, see *post*) of the owner, without any duties being demandable. Woollens are the only exception to this rule: since 1833, interest is charged upon the amount of duty payable on their account from the time of their importation.

Port Charges.—For American vessels, or those of States having reciprocity treaties:—

	Dolls. cts.	*£*	*s.*	*d.*
Fees on entering	5 70	or 1	5	7½
Fees on clearing	2 70	or 0	12	1½

CUSTOM-HOUSE FEES.—1. *Fees payable to Collector.*— Entry of a vessel of 100 tons or upwards, 2 dollars and 50 cents; clearance of a vessel of 100 tons or upwards, 2 dollars and 50 cents: entry of a vessel under 100 tons, 1 dollar and 50 cents; clearance of a vessel under 100 tons, 1 dollar and 50 cents; every post entry, 2 dollars; permit to land goods, 20 cents; every bond taken officially, 40 cents; permit to load goods, for the exportation, for drawback, 30 cents; debenture or other official certificate, 20 cents; official document (register excepted), required by any person, 20 cents.

2 *Fees payable to the Surveyor.*— Admeasuring and certifying the same, of every ship or vessel of 100 tons and under, per ton, 1 cent; admeasurement of every ship or vessel above 100 tons, and not exceeding 200 tons, 1 dollar and 50 cents; above 200 tons, 2 dollars; for all other services on board any ship or vessel of 100 tons and upwards, having on board goods, wares, or merchandise subject to duty, 3 dollars; for like services on board any ship or vessel of less than 100 tons, 1 dollar and 50 cents; on all vessels not having on board goods, wares, or merchandise subject to duty, 66 2-3 cents. Certificate of registry of vessels, 2 dollars. Endorsement of registry or record, 1 dollar. Every bond required by this act, 25 cents; every bond for a Mediterranean passport, 40 cents; every seaman's protection, 25 cents.

Under the Coasting Act.—Admeasuring any vessel in order to the registering, enrolment, licensing, or recording the same, of 5 tons or upwards, and less than 20, 50 cents; 20 and not exceeding 70, 75 cents; 70, 1 dollar; above 100, 150 cents. For every certificate of enrolment, 50 cents; every endorsement of ditto, 20 cents.; every licence, including the bond, not exceeding 20 tons, 25 cents; above 20 tons, and not more than 100, 50 cents; more than 100, 1 dollar. Recording certificate, manifest, and granting permit, of less than 20 tons, 25 cents; above 50 tons, 50 cents. For certifying a manifest, and granting permit for registered vessels, 150 cents. For receiving certified manifest and granting permit for registered vessels, 150 cents. Granting permit for a vessel not belonging to a citizen, on arrival, to proceed from district to district, and receiving a manifest, 2 dollars; receiving manifest and granting permit to unload, as above, 2 dollars. Granting permit for a vessel to carry on fishery in a foreign port, 25 cents. For report and entry of any foreign goods imported in such last-mentioned vessel, 25 cents.

	Dolls.	£	s.	d.

N.B.—Wharfs are all private property.

RATES OF COMMISSION, *revised in* 1857, *and recommended by the Chamber of Commerce to be charged where no express agreement to the contrary exists.*

Banking.

	p. cent.
On purchase of stocks, bonds, and all kinds of securities, including the drawing of bills for payment of same	1
On sale of stocks, bonds, and all kinds of securities, including remittances in bills and guaranty	1
On purchase or sale of specie and bullion	½
Remittances in bills of exchange	½
Remittances in bills of exchange, with guaranty	1
Drawing or indorsing bills of exchange	1
Collecting dividends on stocks, bonds, or other securities	½
Collecting interest on bonds and mortgages	1
Receiving and paying moneys on which no other commission is received	½
Procuring acceptance of bills of exchange payable in foreign countries	¼
On issuing letters of credit to travellers, exclusive of foreign bankers' charge	1
Where bills of exchange are remitted for collection, and returned under protest for non-acceptance or non-payment, the same commissions are to be charged as though they were duly accepted and paid.	

General Business.

On sales of sugar, coffee, tea, and general merchandise, usually sold in large quantities and on credit under 6 months	5
On sales of manufactured goods and other articles, usually sold on long credits, for 6 months and guaranty	7½
Ditto, ditto, for cash	5
On purchase and shipment of merchandise, with funds in hand, on cost and charges	2½
Collecting delayed and litigated accounts	5
Effecting marine insurance, on amount insured	½
No amount to be charged for effecting insurance on property consigned.	
Landing and reshipping goods from vessels in distress, on value of invoice	2½
on specie and bullion	½
Receiving and forwarding merchandise entered at custom-house, on invoice value 1 per cent., and on expenses incurred	2½
On consignments of merchandise withdrawn or reshipped, full commissions are to be charged to the extent of advances or responsibilities incurred, and one half commission on the residue of the value.	
On giving bonds that passengers will not become a burden on the city, on the amount of the bonds	2½
The risk of loss by robbery, fire (unless insurance be ordered), theft, popular tumult, and all other unavoidable occurrences, is in all cases to be borne by the owners of the goods, provided due diligence has been exercised in the case of them.	

Shipping

	p. cent.
On purchase or sale of vessels	2½
Disbursements and outfit of vessels	2½
Procuring freight and passengers for Europe, East Indies, and domestic ports	2½
For West Indies, South America, and other places	5
For foreign vessels, in all cases	5
Collecting freight	2½
Collecting insurance losses of all kinds	2½
Chartering vessels on amount of freight, actual or estimated, to be considered as due when the charter parties are signed	2½
But no charter to be considered binding till a memorandum, or one of the copies of the charter, has been signed.	
On giving bonds for vessels under attachment in litigated cases, on amount of liability	2½
The foregoing commissions to be exclusive of brokerage, and every charge actually incurred.

Tobacco, manufactured in kegs of 100 lbs.	2
Wines. *See* Liquors.	
Woods, for dyeing, under cover, per ton	50
ditto, in yards	25
Whiting, in hhds., per ton	37½

On articles on which the rate is fixed by weight, it is understood to be on the gross weight; and on liquors, oil, &c. on which the rate refers to gallons, it is understood to be on the whole capacity of the casks, whether full or not. The proprietor of goods to be at the expense of putting them in store, stowing away, and turning out of store. — All goods taken on storage to be subject to a month's storage; if taken out within 15 days after the expiration of the month, to pay ½ a month's storage; if after 15 days, a whole month's storage.

Harbour Master.

The office of harbour master was created in 1808, by legislative enactment, with power to regulate and station all vessels in the harbour, or at the wharfs, to accommodate vessels wishing to discharge their cargoes, and to decide promptly all disputes connected with the foregoing subjects. Resisting his authority subjects to a fine of 50 dollars and costs, for the benefit of the New York hospital.

Fees. — On vessels unloading, 1¼ cent per ton. Vessels paying foreign duties and tonnage, *double:* which must be paid within 48 hours after arrival. Schooners and sloops in the coasting trade, 2 dollars. For adjusting any difference respecting situation, 2 dollars.

Pilots must register their vessels, names and places of abode, in his office; and are obliged to put to sea whenever ordered by him. The penalty for refusing is 5 dollars and loss of licence.

Rates of Pilotage.

From 1st April to 1st November.					From 1st November to 1st April.

Note. — Outward Pilotage same as Inward, if boarded eastward of the White Buoy of the Bar; Half Pilotage when boarded westward of the White Buoy of the Bar, and none to be allowed unless a Pilot is required.

Pilot boats are numbered and designated by a square Burgee with white centre and blue border, the number being in the centre.

Wardens of the Port.

Vessels and goods arriving in a damaged state, and required to be sold by auction for the benefit of underwriters out of the city of New York, must be under the inspection of the wardens, who may be required to certify the cause of the damage, and amount of sale and charges.

Fees. — 1½ per cent. on gross amount of sales; and for each survey on board of any vessel, at any store, or along the dock, or wharfs, 3 dols. on damaged goods; each survey on hulls, spars, rigging, &c., 5 dols.; each certificate, 1 dol. 25 cts.; ditto of distress of said vessel, 2 dols 50 cts.; same services for vessels paying foreign duties and tonnage, *double.*

Quantity of Goods to compose a Ton.

Determined by the New York Chamber of Commerce.

1,568 lbs. of coffee in casks, 1,850 ditto in bags; 1,120 lbs. cocoa in casks, 1,307 ditto in bags.
952 lbs. of pimento in casks, 1,110 ditto in bags.
8 barrels of flour of 196 lbs. each.
6 barrels of beef, pork, tallow, pickled fish, pitch, tar, and turpentine.
20 cwt. of pig and bar iron, potashes, sugar, logwood, fustic, Nicaragua wood, and all heavy dye woods, rice, honey, copper ore, and all other heavy goods.
16 cwt. of coffee, cocoa, and dried codfish, in bulk, and 12 cwt. of dried codfish in casks of any size.
6 cwt. ship bread in casks, 7 cwt. in bags, and 8 cwt. in bulk.
200 gallons (wine measure) reckoning the full contents of the casks, of oil, wine, brandy, or any kind of liquors.
22 bushels of grain, peas, or beans, in casks.
36 bushels of ditto in bulk.
36 bushels of European salt.
31 bushels of salt from the West Indies.
29 bushels of sea-coal.
40 feet (cubic measure) of mahogany, square timber, oak plank, pine and other boards, beaver, furs, peltry, bees'-wax, cotton, wool, and bale goods of all kinds.
1 hogshead of tobacco, and 10 cwt. of dry hides.
8 cwt. of China raw silk, 10 cwt. nett bohea, and 8 cwt. green tea.

Tares allowed by Custom.

Alum in bags	5 lbs.
in casks	10 per cent.
Cheese, in casks or tubs	15 —
Cocoa, in serons	8 —
Copperas, in casks	16 —
Cassia, in boxes	actual
in mats	6 per cent.
Cinnamon, in boxes	actual
in bales	6 per cent.
Cloves, in casks	12 —
in bags	4 —
Currants, in casks	12 —
in boxes	10 —
Figs, in boxes	10 —
Glue, in casks	20 —
in boxes	15 —

Indigo, in cases	17 —
Nutmegs, in casks	12 —
in bags	4 —
Powder, gun, in ½ casks	9 lbs.
whole do.	23 —
Plums, in boxes	6 per cent.
Prunes, in do.	8 —
Paris, white in casks	10 —
Raisins, in jars	18 lbs.
in boxes	15 per cent.
in casks	12 —
in frails	4 —
in drums	10 —
Rice	10 —
Snuff, in boxes	13 —
Sugar-candy, in tubs	15 —
Sugar, in loaves	14 lbs.
Steel, per bundle	3 —
Shumac, no tare: sometimes 1 lb. per bag is allowed.	
Sheet iron, in casks	15 per cent.
Steel, in cases and casks	8 —
Spikes, in casks	8 —
in bags	3 —

Tallow, in bales	8	per cent.
in casks	12	—
in serons	8	—
in tubs	15	—
Twine, in boxes	12	—
in casks	12	—
in bales	3	—
Tobacco, in boxes	15	—
Wire, in casks	8	—
Whiting, in do.	10	—

Actual tare is allowed on fruit if required.

Tares allowed by Law.

On candles in boxes	8	—
Cheese, in hampers or baskets	10	—
in boxes	20	—
Chocolate, in boxes	10	—
Coffee, in bags	2	—
in bales	3	—
in casks	12	—
Cocoa, in bags	1	—
in casks	4	—
Cotton, in bales	2	—
in serons	6	—
Indigo, in do.	10	—
Nails, in casks	8	—
Pimento, in bags	5	—
Pepper, in bags	2	—
Sugar, other than loaf sugar, in casks	12	—
in boxes	15	—
in mats or bags	5	—
Salts, Glauber	8	—
Sugar-candy, in boxes	10	—
Soap, in boxes	10	—
shot, in casks	3	—
Every whole chest of bohea tea	70	lbs.
½ do. do.	36	—
¼ do. do.	20	—
Every chest of hyson or other green tea of 70 lbs. or upwards	20	—
Every box of other tea between 50 and 70 lbs.	18	—
do. do. if 80 lbs.	20	—
do. do. from 80 lbs. and upwards	22	—

The above to include ropes, canvass, and other coverings. On all other boxes of tea, according to the invoices or actual weight thereof.

Quarantine Regulations for the Port of New York.

The following "Act concerning Quarantine, and Regulations in the nature of Quarantine," was passed May 13th, 1846:—

§ 1. The anchorage ground for vessels at quarantine shall be near the Marine Hospital, on Staten Island, and be designated by buoys to be anchored under the direction of the health officer; and every vessel subject to quarantine shall, immediately on her arrival, anchor within them, and there remain, with all persons arriving in her, subject to the examinations and regulations imposed by law.

§ 2. Vessels arriving at the port of New York shall be subject to quarantine as follows:—

1. All vessels direct from any place where yellow, bilious-malignant, or other pestilential or infectious fever existed at the time of their departure, or which shall have arrived at any place, and proceeded thence to New York, or on board of which during the voyage any case of such fever shall have occurred, arriving between the thirty-first day of May and the first day of October, shall remain at quarantine for at least thirty days after their arrival, and at least twenty days after their cargo shall have been discharged, and shall perform such further quarantine as the health officer may prescribe.

2. All vessels embraced in the foregoing subdivision arriving between the first day of April and the first day of November, exclusive of the time in said subdivision mentioned; all vessels from a foreign port, on board of which during the voyage, or while at the port of departure, any person shall have been sick, or from any place in the ordinary passage from which they pass south of Cape Henlopen, arriving between the thirty-first day of May and the sixteenth day of October; and all vessels from any place (including islands) in Asia, Africa, or the Mediterranean, or from any of the West India, Bahama, Bermuda, or Western Islands, or from any place in America, in the ordinary passage from which they pass south of Georgia, arriving between the first day of April and the first day of November, shall be subject to such quarantine and other regulations as the health officer shall prescribe.

§ 3. It shall be the duty of the health officer to board every vessel subject to quarantine or visitation by him immediately on her arrival; to inquire as to the health of all persons on board, and the condition of the vessel and cargo, by inspection of the bill of health, manifest, log book, or otherwise; to examine on oath as many and such persons on board of vessels suspected of coming from a sickly port, or having had sickness on board during the voyage, as he may judge expedient, and to report the facts and his conclusions to the mayor and commissioners of health in writing.

§ 4. The health officer shall have power

1. To remove from the quarantine anchorage ground any vessel he may think unsafe, to any place south of the quarantine buoys, and inside of Sandy Hook.

2. To cause any vessel under quarantine, when he shall judge it necessary for the purification of the vessel or her cargo, to discharge her cargo at the quarantine grounds, or some other suitable place out of the city.

3. To cause any such vessel, her cargo, bedding, and the clothing of persons on board, to be ventilated, cleansed, and purified in such manner and during such time as he shall direct; and if he shall judge it necessary to prevent infection or contagion, to destroy any portion of such cargo, bedding, or clothing which he may deem incapable of purification.

4. To prohibit and prevent all persons arriving in vessels subject to quarantine, from leaving quarantine until fifteen days after the sailing of their vessel from the port of her departure, and fifteen days after the last case of pestilential or infectious fever that shall have occurred on board, and ten days after her arrival at quarantine, unless sooner discharged by him.

5. To permit the cargo of any vessel under quarantine, or any portion thereof, whenever he shall judge the same free from infection and contagion, to be conveyed to the city of New York, or such place as may be designated by the mayor and commissioners of health, after having reported in writing to the mayor and commissioners of health of said city the condition of said cargo, and his intention to grant such permission; such permission, however, to be inoperative without the written approval of the mayor and commissioners of health.

§ 5. The health officer, the board of health, or the mayor and commissioners of health may, if in their opinion it will not be dangerous to the public health, permit the cargo of any vessel under quarantine, or any part thereof, to be shipped for exportation by sea, or transportation up the North or East rivers; but if the vessel receiving the same shall approach nearer than three hundred yards to the wharves of this city, such cargo may be seized and sold by the commissioners of health for the use of the Marine Hospital.

§ 6. Every vessel during her quarantine shall be designated by colours, to be fixed in a conspicuous part of her main shrouds.

§ 7. No vessel or boat shall pass through the range of vessels lying at quarantine, or land at the quarantine ground after sunset without the permission of the health officer.

§ 8. No lighters shall be employed to load or unload vessels at quarantine without permission of the health officer, and subject to such restrictions as he shall impose.

§ 9. All passengers under quarantine who shall be unable to maintain themselves, shall be provided for by the master of the vessel in which they shall have arrived; and if the master shall omit to provide for them, they shall be maintained on shore at the expense of such vessel, and such vessel shall not be permitted to leave the quarantine until such expense shall have been repaid.

§ 10. The health officer, upon the application of the master of any vessel under quarantine, may confine in any suitable place on shore, any person on board of such vessel charged with having committed an offence punishable by the laws of this State, or the United States, and who cannot be secured on board such vessel, and such confinement may continue during the quarantine of such person, or until he shall be proceeded against in due course of law, and the expenses thereof shall be charged and collected, as in the last preceding section.

§ 11. All vessels and persons remaining at quarantine on the first day of October, shall hereafter be subject to such quarantine and restrictions as vessels and persons arriving on and after that day.

§ 12. The board of health, or the board and commissioners of health, whenever in their judgment the public health shall require it, may order any vessel at the wharves of the city, or in their vicinity, to the quarantine ground, or other place of safety, and may require all persons, articles or things introduced into the city from such vessel to be seized, returned on board, or removed to the quarantine ground. In case the master, owner, or consignee of the vessel cannot be found, or shall refuse or neglect to obey the order of removal, the board of health, or the mayor and commissioners of health, shall have power to cause such removal at the expense of such master, owner, or consignee; and such vessel or persons shall not return to the city without the written permission of the board of health, or the mayor and commissioners of health.

§ 13. If any vessel arriving at the quarantine ground, subject to quarantine, shall be bound to some port east of the city of New York, the health officer, after having duly visited and examined her, may permit her to pass on her voyage through the Sound; but no such vessel shall be brought to anchor off the city, nor shall any of the crew or passengers land in, or hold any communication with the city, or any person therefrom.

§ 14. No vessel, found on examination of the health officer to be infected with the yellow fever, or to have been so infected after sailing from her port of departure, shall be permitted to approach within three hundred yards of the city of New York, between the first day of May and the first day of October in the same year. But the health officer, with the permission of the board of health of the cities of New York and Brooklyn, may permit any vessel arriving at the port of New York to proceed to some wharf designated by the board of health of either of the cities of New York or Brooklyn, and discharge its cargo; provided satisfactory proof be given to the health officer that the port or ports from which said vessel sailed was free from contagious or infectious disease at the time of her sailing therefrom, and that no sickness of a contagious or infectious type has existed on board the vessel during her entire voyage.

§ 15. The master of every vessel released from quarantine, and arriving at the city of New York, shall, within twenty-four hours after such arrival, deliver the permit of the health officer at the office of the mayor and commissioners of health, or to such person as they shall direct, but such vessel shall not approach within three hundred yards of the city of New York, without the written permission of the mayor and commissioners of health.

§ 16. Every vessel having had during the voyage a case of small-pox, or infectious or contagious disease, and every vessel from a foreign port having passengers, and not hereinbefore declared subject to quarantine, shall, on her arrival at the quarantine ground, be subject to visitation by the health officer, but shall not be detained beyond the time requisite for due examination, unless she shall have on board during the voyage some case of small pox, or infectious or contagious disease, in which case she shall be subject to such quarantine as the health officer shall prescribe; and it shall be the duty of the health officer, whenever he thinks it is necessary for the preservation of the public health, to cause the persons on board of any vessel to be vaccinated.

§ 17. Nothing in this act contained shall prevent any vessel arriving at the quarantine from again going to sea before breaking bulk.

§ 18. The commissioners of health shall admit into the Marine Hospital any passenger who shall have paid hospital monies, during any temporary sickness, within one year after such payment. The mayor of the city of New York, the resident physician, and the commissioners of health of said city, shall constitute a board of appeal from any direction or regulation of the health officer, with power to grant such and so much relief as may appear to the board thus constituted, or a majority of them, expedient and proper; the decision of the board of health, however, to be paramount.

§ 19. Every appeal from a decision of the health officer shall be made by serving upon him a written notice of such appeal, within twelve hours after such decision, (Sundays excepted,) and the health officer shall make a return in writing, including the facts on which the decision is founded, within twelve hours after the receipt of such notice, (Sundays excepted,) to the mayor, who shall immediately call a meeting of the board of appeal, and shall be president of said board, and said appeal shall be heard and decided within twenty-four hours thereafter, (Sundays excepted,) and the execution of the decision appealed from shall be suspended until the determination of the appeal.

§ 20. Every master of a vessel subject to quarantine or visitation, arriving in the port of New York, who shall refuse or neglect either—

1. To proceed with and anchor his vessel at the place assigned for quarantine, at the time of his arrival;

2. To submit his vessel, cargo, and passengers to the examination of the health officer, and to furnish all necessary information to enable that officer to determine to what length of quarantine and other regulations they ought respectively to be subject; or,

3. To remain with his vessel at quarantine during the period assigned for her quarantine; and while at quarantine, to comply with the directions and regulations prescribed by law, and with such as any of the officers of health, by virtue of the authority given to them by law, shall prescribe in relation to his vessel, his cargo, himself, or his crew shall be guilty of a misdemeanor, and be punished by a fine not exceeding 2000 dollars, or by imprisonment not exceeding twelve months, or by both such fine and imprisonment.

§ 21. Every master of a vessel hailed by a pilot, who shall either—

1. Give false information to such pilot relative to the condition of his vessel, crew, passengers, or cargo, or the health of the place or places whence he came, or refuse to give such information as shall be lawfully required:

2. Or land any person from his vessel, or permit any person except a pilot to come on board his vessel, or unlade or tranship any portion of his cargo, before his vessel shall have been visited and examined by the health officer:

3. Or shall approach with his vessel nearer the city of New York than the place of quarantine to which he shall be directed:

Shall be guilty of the like offence, and be subject to the like punishment. And every person who shall land from any such vessel, or unlade or tranship any portion of her cargo, under like circumstances, shall be guilty of the like offence, and be subject to the like punishment.

§ 22. Every person who shall violate any provision of this act, or neglect or refuse to comply with the directions and regulations which any of the officers of health may prescribe, shall be guilty of the like offence, and be subject, for each offence, to the like punishment.

§ 23. Every person who shall oppose or obstruct the health officer in performing the duties required of him, shall be guilty of the like offence, and be punished by fine not exceeding 500 dollars, or by imprisonment not exceeding three months, or by both such fine and imprisonment.

§ 24. Every person who, without authority of the health officer, commissioners of health, or board of health, shall go within the enclosure of the quarantine ground, shall be guilty of the like offence, and be punished by fine not exceeding 100 dollars, or by imprisonment not exceeding thirty days, or by both such fine and imprisonment.

§ 25. Every person who shall go on board of, or have any communication, intercourse or dealing with any vessel at quarantine, without the permission of the health officer, shall be guilty of the like offence, and be subject to the like punishment. And such offender shall be detained at quarantine so long as the health officer shall direct, not exceeding twenty days, unless he shall be taken sick of some pestilential or infectious disease.

§ 26. Every person who shall violate the provisions of the fifth article of title 2nd of chapter 14th of part first of the Revised Statutes, by refusing or neglecting to obey or comply with any order, prohibition or regulation made by the board of health, in the exercise of the powers therein conferred, shall be guilty of a misdemeanour, punishable by fine and imprisonment, at the discretion of the court by which the offender shall be tried.

§ 27. Articles 1st, 3rd, 4th, and 6th, of title 2nd of chapter 14th of part first of the Revised Statutes; an act entitled "An act to amend title 2nd, chapter 14th, part first of the Revised Statutes, relating to the quarantine regulations of the port of New York," passed May 2. 1836; an act entitled "An act relative to the quarantine laws," passed May 7. 1839; an act entitled "An Act to amend the Revised Statutes relating to the public health," passed April 12. 1842, and all other laws inconsistent with this act, are hereby repealed.

We have derived these statements from the *New York Annual Register; The Picture of New York; Hunt's Commercial Magazine; official accounts;* and valuable *private communications.*

TARIFF OF THE UNITED STATES.—Notwithstanding the unprecedented progress of the United States in wealth and population, their foreign trade was nearly stationary for the 10 years ending with 1830. And yet, considering the spirit of commercial enterprise by which the people, particularly in the New England States and New York, are animated, and their skill in navigation, it might have been fairly presumed that the growth of their foreign trade would, at least, have kept pace with the development of the internal resources of the country. That it did not do so, is wholly owing to the policy of government. Not satisfied with the extraordinary advances which their constituents had made in numbers and wealth, Congress seems to have believed that their career might be accelerated by means of Custom-house regulations!—by giving an artificial direction to a portion of the public capital and industry, and turning it into channels into which it would not naturally flow.

No one who has the slightest acquaintance with the condition of America—who knows that she is possessed of boundless tracts of fertile and unappropriated land—that her population is comparatively thin, and wages high—can doubt for a moment that agriculture *must*, for a long series of years, be the most profitable species of employment

Abstract of the Tonnage of the several Districts of the U. States on the last day of June, 1858.

Districts.	Registered.		Enrolled and licensed.		Licensed under twenty Tons.		Aggregate Tonnage of each District.	Registered Tonnage in the		Proportion of the enrolled and licensed Tonnage employed in the				Enrolled Tonnage employed in Steam Navigation.

in which her citizens can engage. There can be no question, indeed, that such branches of manufacture as are naturally adapted to her peculiar situation will gradually grow up and flourish in America, without any artificial encouragement, according as her population becomes denser, and as the advantage which now exists on the side of agriculture becomes less decided. And the imposition of moderate duties on foreign articles for the sake of revenue would certainly give these branches all the protection to which they are justly entitled, or more. But to force, by means of duties and prohibitions, imposed not for the sake of revenue, but of protection, the premature growth of manufactures, is plainly to force a portion of the industry and capital of the country into businesses in which it will be *least* productive.

Such, however, was for a lengthened period, the policy of the American legislature. The exploded sophisms of the mercantile system, though renounced by every statesman in Europe, acquired a noxious influence in Congress, and were put forth with as much confidence, as if their soundness neither had been nor could be questioned! From 1816 down to 1846, the object of the American legislature has, for the most part, been to bolster up a manufacturing interest, by imposing oppressive duties on most manufactured articles imported from abroad. Now, it is obvious, even had the articles produced in America through the agency of this plan been nearly as cheap as those they superseded, that nothing would have been gained by it; for, to whatever extent the importation of foreign articles might be diminished, there must have been a corresponding diminution in the exportation of native American products; so that the only result would have been the raising up of one species of industry at the expense of some other species entitled to an equality of protection. But the "American system" was not so innocuous. Instead of the goods manufactured in the States being as cheap as similar ones manufactured in Europe, they were admitted to be, at an average, from 30 to 50 or 60 per cent. dearer! The extent of the pecuniary sacrifice that was thus imposed on the Union by the tariff modified in 1832 has been variously estimated by American writers; and we have been assured by those who have the best means of knowing, that it may be taken as amounting to from 50,000,000 to 60,000,000 dollars, or from about 11,000,000*l.* to 13,000,000*l.* a year! And this immense burden—a burden more than twice as great as the whole public expenditure of the republic — was incurred for no purpose of public utility, and was productive of nothing but mischief. The whole effect of the scheme was to divert a certain amount of the national capital from the production of cotton, wheat, rice, tobacco, &c., the equivalents sent to foreigners in payment of manufactured goods, to the direct production of these goods themselves! And as the latter species of industry is less suitable for America, a tax of 13,000,000*l.* a year was imposed on the Union, that the manufacturers might be enabled to continue a losing business. We leave it to others to determine whether the absurdity of the system, or its costliness, was its more prominent feature. That its influence was not more injurious is solely owing to the smuggling it occasioned. With a frontier like that of America, it would be worse than absurd to suppose that an oppressive tariff could be carried into full effect. But it had enough of influence to render it highly prejudicial, —to occasion a great rise in the price of many important articles—to cripple the trade

and navigation of the country—and to throw a considerable part of it into the hands of smugglers, who carried it on in defiance of the law.

It is difficult, however, to say how long the system of imposing high duties on most foreign products might have been maintained without so much as a check, but for its political effects. It was principally patronised by the Northern States; and though it would be difficult to show that they derived any benefit from it, it is, at all events, pretty certain that it was most injurious to the Southern States. Their staple products are cotton, tobacco, and rice, of which by far the largest portion is exported to foreign countries; and the planters speedily found that every restriction on importation from abroad occasioned a corresponding difficulty of exportation. This led to a disunion of interests and to strong remonstrances against the tariff by the Southern States. These, however, were disregarded. Provoked at this treatment, South Carolina took the decisive step of refusing to enforce the customs acts; and threatened, if coercion were attempted, to repel force by force, and to recede from the Union! This was a death blow to the high duties of the old tariff. Congress now saw, what all sensible men had seen long before, that it was necessary to recede; that, in fact, either the tariff must be modified, or the integrity of the Union be brought into jeopardy. A law, commonly called the "Compromise Act," was in consequence passed on the 14th of July, 1832, which provided that certain reductions should be progressively made on the then existing duties on most descriptions of foreign goods, at certain specified periods between 1833 and 1842, when they were, in most instances, to be reduced to 20 per cent., *ad valorem*.

This act was allowed to take effect for a few years; but as the reduction specified in it began to come into practical operation, the manufacturers, also, began to set up fresh claims for additional protection. Probably, however, the latter might not have been able to carry their point had not the Southern States been apprehensive that if they made any resolute stand against the proposal to increase the duties, and still more if they threatened to secede from the Union in the event of its being carried, they might be brought into serious difficulties by the agitation of the question as to the emancipation of their slaves. The latter, therefore, having to choose between two evils, preferred of course, that which they believed to be least; and purchased a truce for the emancipation question by agreeing to the tariff act passed in 1842, by which comparatively high duties were again imposed on most descriptions of imported articles.

Happily, however, this system was not so permanent as was expected. The Western and Southern States, being those most directly interested in a low tariff, have of late years had a majority in Congress; and the apprehensions with regard to negro emancipation, excited by the proceedings in our islands, having subsided, sounder opinions, with regard to commercial matters, began again to prevail in Congress. Perhaps, however, the majority now referred to, or the party of Mr. Polk, might not have endeavoured to act on these principles without the example set by England; but the great commercial reforms effected in this country during the administration of Sir Robert Peel, and more especially the last and greatest of all, the change in the corn-laws, had a powerful influence in the U. States; and Mr. Polk's government having profited by these and other circumstances which it is needless to specify, succeeded in carrying a comparatively liberal tariff, which took effect from the 1st December, 1846. And this tariff, we are glad to say, kept its ground till 1857, when it was superseded by the still more liberal tariff given below.

It is, of course, impossible to foretell whether the new tariff will be maintained for any considerable period. It is understood that the political party by which it has been enacted are losing ground, and that those opposing them will, most likely, be in the ascendant at the next presidential election; and, if so, it is probable that an attempt will be made to alter the tariff, by again imposing high duties on most species of manufactured goods. But we would fain hope that the bulk of the American people may see the policy of opposing any such change. They never have been supposed to be blind or indifferent to their own interests; and these, they may be assured, will be best promoted by maintaining a system which enables them to sell in the dearest and to buy in the cheapest markets. If they re-impose high duties they will fall wholly on themselves, and on no one else; and the less they buy from foreigners, the less will they be able to export to them. It is incomparably more for their own advantage than for that of those who deal with them, that the existing tariff should be maintained; and such being the case, the presumption would seem to be that it will be maintained.

COMMERCIAL REGULATIONS. — UNITED STATES TARIFFS OF 1846 AND 1857.

An act reducing the duty on imports, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That on and after the first day of July, eighteen hundred and fifty-seven, *ad valorem* duties shall be imposed in lieu of those now imposed upon goods, wares, and merchandise imported from abroad into the United States, as follows, viz.: Upon the articles enumerated in schedules A and B of the tariff

act of eighteen hundred and forty-six, a duty of thirty per centum, and upon those enumerated in schedules C, D, E, F, G, and H of said act, the duties of twenty-four per centum, nineteen per centum, fifteen per centum, twelve per centum, eight per centum, and four per centum, respectively, with such exceptions as are hereinafter made; and all articles so imported as aforesaid, and not enumerated in the said schedules, shall pay a duty of fifteen per centum.

SCHEDULE A, B. — 30 *per cent.*

	1846.	1857.
Alabaster and spar ornaments	40	30
Anchovies, sardines, and all other fish preserved in oil	40	30
Brandy and other spirits distilled from grain or other materials	100	30
Camphor, refined	40	30
Composition tops for tables or other articles of furniture	40	30
Comfits, sweetmeats, or fruits preserved in sugar, brandy or molasses	40	30
Cordials, absynthe, arrack, curacoa, kirschenwasser, liquors, maraschino, ratafia, and all other spirituous beverages of a similar character	100	30
Glass, cut	40	30
Manufacture of cedar wood, granadilla, ebony, mahogany, rose-wood, and satin wood	40	30
Prepared vegetables, meats, poultry, & game, sealed or enclosed in cans or otherwise	40	30
Scaglola tops for tables, or other articles of furniture	40	30
Cigars, snuff, paper cigars, and all other manufactures of tobacco	40	30
Wines — Burgundy, Champagne, claret, Madeira, port, sherry, and all other wines and imitations of wines	40	30

SCHEDULE C. — 24 *per cent. ad valorem.*

Ale, beer, and porter, in casks or bottles	30	24
Argentine, albata, or German silver, manufactured or unmanufactured	30	24
Articles embroidered with gold, silver, or other metals	30	24
Articles worn by men, women, or children, of whatsoever material composed, made up, or made wholly or in part by hand	30	24
Asses' skins	30	24
Balsams, cosmetics, essences, extracts, pastes, perfumes, and tinctures, used either for the toilet, or for medicinal purposes	30	24
Baskets, and all other articles composed of grass, oziers, palm leaf, straw, whalebone, or willow, not otherwise provided for	30	24
Bay rum, Bologna sausages	30	24
Beads of amber, composition, or wax, and all other beads	30	24
Bracelets, braids, chains, curls, or ringlets, composed of hair, or of which hair is a component part	30	24
Braces, suspenders, webbing, or other fabrics, composed wholly or in part of India-rubber, not otherwise provided for	30	24
Cameos, real and imitation, and mosaics, real and imitation, when set in gold, silver, or other metal	30	24
Canes and sticks for walking, finished or unfinished	30	24
Capers, pickles, and sauces of all kinds, not otherwise provided for	30	24
Caps, hats, muffs, and tippets of fur, and all other manufactures of fur, or of which fur shall be a component material	30	24
Caps, gloves, leggings, mits, socks, stockings, wove shirts and drawers, and all similar articles made on frames, worn by men, women, or children, and not otherwise provided for	30	24
Card cases, pocket-books, shell boxes, souvenirs, and all similar articles, of whatever material composed	30	24
Carpets, carpeting, hearth rugs, bedsides, and other portions of carpeting, being either Aubusson, Brussels, ingrain, Saxony, Turkey, Venetian, Wilton, or any other similar fabrics	30	24
Carriages, and parts of carriages	30	24
Cheese, clocks, and parts of clocks	30	24
Clothing, ready made, and wearing apparel of every description, of whatever material composed, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer	30	24
Coach and harness furniture of all kinds	30	24
Coal, coke, and culm of coal	30	24
Combs and brushes of all kinds	30	24
Combs of all kinds	30	24
Compositions of glass or paste, when set	30	24
Confectionery of all kinds, not otherwise provided for	30	24
Cord, cut or unmanufactured, of silk	30	24
Cotton cords, gimps, and galloons	30	24
Courtpiaster, crayons of all kinds	30	24
Cutlery of all kinds	30	24
Diamonds, gems, pearls, rubies, and other precious stones, and imitations of precious stones, when set in gold, silver, or other metal	30	24
Dolls, and toys of all kinds	30	24
Earthen, china, and stone ware, and all other wares, composed of earthy and mineral substances, not otherwise provided for	30	24
Epaulets, galloons, laces, knots, stars, tassels, tresses, and wings, of gold, silver, or other metal	30	24
Fans and fire screens of every description, of whatever material composed	30	24
Feathers and flowers, artificial or ornamental, and parts thereof, of whatever material composed	30	24
Fire crackers	30	24
Flats, braids, plaids, sparterre, and willow squares, used for making hats or bonnets	30	24
Frames and sticks for umbrellas, parasols, and sunshades, finished or unfinished	30	24
Furniture, cabinet, and household	30	24
Glass, coloured, stained, or painted	30	24
Glass crystals for watches	30	24
Glass, or pebbles for spectacles	30	24
Glass tumblers, plain, molded, or pressed, not cut or painted	30	24
Paintings on glass, porcelain glass	30	24
Hair penotis, hat bodies of cotton	30	24
Hats and bonnets, for men, women, and children, composed of straw, satin straw, chip, grass, palm-leaf, willow, or any other vegetable substance, or of hair, whalebone, or other material, not otherwise provided for	30	24
Hemp unmanufactured, honey	30	24
Human hair, cleansed or prepared for use	30	24
Ink and ink powder	30	24
Iron, in bars, bloom, bolts, loops, pigs, rods, slabs, or other form, not otherwise provided for	30	24
Castings of iron, old or scrap iron	30	24
Vessels of cast iron	30	24
Japanned ware of all kinds, not otherwise provided for	30	24
Jewelry, real or imitation	30	24
Jet and manufactures of jet, and imitations thereof	30	24
Lead pencils	30	24
Maccaroni, vermicelli, gelatine, jellies, and all similar preparations	30	24
Manufactures of the bark of the cork tree, except corks	30	24
Manufactures of bone, shell, horn, pearl, ivory, or vegetable ivory	30	24
Manufactures, articles, vessels, and others, not otherwise provided for, of brass, copper, gold, iron, lead, pewter, platina, silver, tin, or other metal, or of which either of those metals or any other metal shall be the component material of chief value	30	24
Manufactures of cotton, linen, silk, wool, or worsted, if embroidered or tamboured in the loom or otherwise, by machinery or with the needle or other process	30	24
Manufactures composed wholly of cotton, which are bleached, printed, painted, or dyed, and de laines	25	24
Manufactures, articles, vessels, and wares of grass, or of which grass shall be a component material, not otherwise provided for	30	24
Manufactures and articles of leather, or of which leather shall be a component part, not otherwise provided for	30	24
Manufactures and articles of marble, marble paving tiles, and all other marble more advanced in manufacture than in slabs or blocks in the rough	30	24
Manufactures of paper, or of which paper is a component material, not otherwise provided for	30	24
Manufactures of wool, or of which wool shall be the component material of chief value, not otherwise provided for	30	24
Medicinal preparations, not otherwise provided for	30	24
Manufactures of wood, or of which wood is a component part, not otherwise provided for	30	24
Metallic pens, mineral waters, molasses	30	24
Muskets, rifles, and other fire-arms	30	24
Nuts, not otherwise provided for	30	24
Ochres and ochry earths, used in the composition of painters' colours, whether dry or ground in oil, not otherwise provided for	30	24
Oilcloth of every description, of whatever material composed	30	24
Oils, volatile, essential, or expressed, and not otherwise provided for	30	24
Olive oil in casks, other than salad oil	30	24
Olive salad oil, and all other olive oil, not otherwise provided for	30	24
Olives	30	24
Paper, antiquarian, demy, drawing, elephant, foolscap, imperial, letter, and all other paper not otherwise provided for	30	24
Paper boxes, and all other fancy boxes	30	24
Paper envelopes	30	24
Parasols and sunshades, parchment	30	24
Plated and gilt ware of all kinds	30	24
Playing cards, potatoes, red chalk pencils	30	24
Saddlery of all kinds, not otherwise provided for	30	24
Salmon preserved, sealing-wax	30	24
Sewing silks, in the gum, or purified	30	24
Shoes, composed wholly of India-rubber	30	24
Side arms of every description	30	24
Silk twist, and twist composed of silk and mohair	30	24
Silver-plated metal, in sheets or other form	30	24
Soap, Castile, perfumed, Windsor, and all other kinds	30	24
Sugar of all kinds, sirup of sugar	30	24
Tobacco, unmanufactured	30	24
Twines and pack-thread, of whatever material composed	30	24
Umbrellas, vellum, vinegar	30	24
Wafers, water-colours	30	24
Wood, unmanufactured, not otherwise provided for, and fire-wood	30	24
Wool, unmanufactured, not otherwise provided for	30	24

SCHEDULE D. — 19 *per centum ad valorem.*

	1846.	1857.
Borax or tincal, not otherwise provided for	25	19
Buttons and button molds of all kinds	25	19
Baizes, bockings, flannels and floor cloths, of whatever material composed, not otherwise provided for	25	19
Cables and cordage, tarred or untarred	25	19
Calomel and all other mercurial preparations	25	19
Cotton laces, cotton insertings, cotton trimming laces, cotton lace and braids	25	19
Floss silks, feather beds, feathers for beds, and downs of all kinds	25	19
Grass cloth	25	19
Hair cloth, hair seating, and all other manufactures of hair, not otherwise provided for	25	19
Japanned leather or skins of all kinds	20	19
Jute, manila, and sisal grass, coir and other vegetable substances, unmanufactured, not otherwise provided for	25	19
Manufactures, composed wholly of cotton, not otherwise provided for	25	19
Manufactures of goats' hair or mohair, or of which goats' hair or mohair shall be a component material, not otherwise provided for	25	19
Manufactures and articles of silk, or of which silk shall be a component material, not otherwise provided for	25	19
Manufactures of worsted, or of which worsted shall be a component material, not otherwise provided for	25	19
Matting, China and other floor matting and mats, made of flags, jute or grass	25	19
Roofing slates, and slates other than roofing slates	25	19
Woollen and worsted yarn	25	19

SCHEDULE E. — 15 *per centum ad valorem.*

	1846.	1857.
Alum	20	15
Angora, Thibet, and other goats' hair or mohair, unmanufactured, not otherwise provided for	20	15
Arrow root, bacon, barley, beef, beeswax	20	15
Berries, vegetables and flowers, not otherwise provided for	20	15
Blankets of all kinds	20	15
Blank books, bound or unbound. (See Periodicals.)	20	15
Blue or Roman vitriol, or sulphate of copper	20	15
Boards, planks, staves, laths, scantling, spars, hewn and sawed timber, and timber to be used in building wharves	20	15
Brencia, bronze liquor, bronze powder	20	15
Butter, cadmium	20	15
Calamine	20	15
Caps, gloves, leggins, mits, socks, stockings, wove shirts, and drawers, made on frames, composed wholly of cotton, worn by men, women, and children	20	15
Cassia buds, castor oil, castorum, chocolate	20	15
Chromate of lead	20	15
Chromate, bichromate, hydriodate and prussiate of potash	20	15
Cobalt, coculus indicus	20	15
Copperas or green vitriol, or sulphate of iron	20	15
Copper, in sheets or plates, called braziers' copper, and other sheets of copper, not otherwise provided for	20	15
Copper rods, bolts, nails and spikes	20	15
Copper bottoms	20	15
Cubebs, dried pulp, ether, feldspar, fig blue	20	15
Fish, foreign, whether fresh, salted, smoked, dried, or pickled, not otherwise provided for	20	15
Fish glue or isinglass, fish skins, flaxseed	20	15
Flour of sulphur, Frankfort black	20	15
French chalk, fulminates or fulminating powders, furs dressed on the skin	20	15
Gamboge	20	15
Ginger, green, ripe, dried, preserved and pickled	40 & 30	15
Glue, green turtle, gunny cloth, gunpowder	20	15
Hair, curled, moss, sea weed, and all other vegetable substances used for beds or mattresses	20	15
Hams, hats of wool	20	15
Hat bodies made of wool, or of which wool shall be a component material of chief value	20	15
Hatters' plush, composed of silk and cotton, but of which cotton is the component material of chief value	20	15
Hempseed, or linseed, and rapeseed oil, and all other oils used in painting	20	15
Indian corn and corn meal	20	15
Ipecacuanha, iridum, isis or orris root	20	15
Iron liquor, jalap, juniper berries	20	15
Lampblack, lard	20	15
Leather, tanned, bend, or sole, not otherwise provided for	20	15
Leather, upper of all kinds, not otherwise provided for	20	15
Lead, in pigs, bars or sheets	20	15
Lead pipes, lead shot, leeches	20	15
Linens of all kinds	20	15
Liquorice paste, juice or root, litharge	20	15
Malt, manganese, manna	20	15
Manufactures of flax, not otherwise provided for	20	15
Manufactures of hemp, not otherwise provided for	20	15
Marble in the rough, slab or block unmanufactured	20	15
Marine coral, unmanufactured	20	15
Medicinal roots, leaves, gums and rosins, in a crude state, not otherwise provided for	30 25	20 15
Metals, Dutch and bronze, in leaf	20	15
Metals, unmanufactured, not otherwise provided for	20	15
Mineral and bituminous substances, in a crude state, not otherwise provided for	20	15
Musical instruments of all kinds, and strings for musical instruments of whipgut or catgut, and all other strings of the same material	20	15
Needles of all kinds, for sewing, darning or knitting	20	15
Nitrate of lead	20	15
Oats and oatmeal	20	15
Ochres and ochry earths, dry	20	15
Oils — neatsfoot and other animal oil, spermaceti, whale and other fish oil, the produce of foreign fisheries	20	15
Opium, orange and lemon peel	20	15
Ozier or willow, prepared for basket makers' use	20	15
Patent mordant	20	15
Paints, dry or ground in oil, not otherwise provided for	20	15
Paper hangings and paper for screens or fireboards	20	15
Paving stones	20	15
Paving and roofing tiles and bricks	20	15
Pearl or hulled barley	20	15
Periodicals and other works in course of printing and republication in the U. S.	20	15
Pitch	20	15
Plumbago, pork, pumpkins, potassium, putty	20	15
Plaster of Paris when ground	20	15
Quicksilver, quills, red chalk, rhubarb	20	15
Rice or paddy, roll brimstone	20	15
Roman cement, rye and rye flour	20	15
Saddlery, common, trimmed or japanned	20	15
Saffron and saffron cake, sago	20	15
Sal soda and all carbonates of soda, by whatever names designated, not otherwise provided for	20	15
Salts — Epsom, Glauber, Rochelle, and all other salts and preparations of salts, not otherwise provided for	20	15
Sarsaparilla, seppia, sheathing paper	20	15
Skins, tanned and dressed, of all kinds, not otherwise provided for	20	15
Skins of all kinds, not otherwise provided for	20	15
Slate pencils, smalts	20	15
Spermaceti candles and tapers	20	15
Spirits turpentine, spunk, squills, starch	20	15
Stearine candles and tapers	20	15
Steel, not otherwise provided for	20	15
Stereotype plates, still bottoms	20	15
Sulphate of barytes, crude or refined	20	15
Sulphate of quinine, tallow candles, tapioca	20	15
Tar, thread laces and insertings, type metal	20	15
Types, new or old, vanilla beans, verdigris	20	15
Velvet in the piece, composed wholly of cotton	20	15
Velvet in the piece, composed of cotton and silk, but of which cotton is the component material of chief value	20	15
Vermilion	20	15
Wares, chemical, earthen, or pottery, of a capacity exceeding ten gallons	20	15
Wax candles and tapers	20	15
Whalebone, the produce of foreign fisheries	20	15
Wheat and wheat flour, white and red lead	20	15
Whiting or Paris white	20	15
White vitriol or sulphate of zinc	20	15
Window glass, broad, crown or cylinder	20	15
Woollen listings	20	15

SCHEDULE F. — 12 *per centum ad valorem.*

	1846.	1857.
Borate of lime	20	12
Brazil paste, codilla or tow of hemp and flax	15	12
Diamonds, glaziers', set or not set	15	12
Silk, raw, not otherwise provided for	15	12
Steel, in bars, cast, shear or German	15	12
Gold and silver leaf, mineral kerms	15	12
Terne tin plates, tin foil	15	12
Zinc, spelter or teutenegue, in sheets	15	12

SCHEDULE G. — 8 *per centum ad valorem.*

	1846.	1857.
Ammonia	10	8
Antimony, crude, or regulus of	20	8
Barks of all kinds, not otherwise provided for	20 & 15	8
Books printed, magazines, pamphlets, periodicals and illustrated newspapers, bound or unbound, not otherwise provided for	10	8
Building stones	10	8
Camphor, crude	25	8
Cantharides, carbonate of soda	20	8
Chronometers, box or ships', and parts thereof	10	8
Compositions of glass or paste, not set	10	8
Cudbear	10	8
Emery, in lump or pulverised	20	8
Engravings or plates, bound or unbound	10	8
Fruits, green, ripe or dried	40, 30, 20	8
Gums — Arabic, Barbary, copal, East India, Jeddo, Senegal, substitute, tragacanth, and all other gums and rosins in a crude state	10	8
Hempseed and rapeseed, fuller's earth	10	8
Furs, hatters', dressed or undressed, not on the skin	10	8
Furs, undressed, when on the skin	10	8
Goldbeaters' skins	10	8
Hair of all kinds, uncleaned and unmanufactured	10	8
Kelp, lemon and lime juice, lime	10	8
Machinery, exclusively designed and expressly imported for the manufacture of flax and linen goods	30	8
Music paper with lines, bound or unbound	10	8
Natron, nux vomica, orpiment	10	8
Polishing stones, pumice and pumice-stones	10	8
Rotten stone, sal ammonia	10	8
Saltpetre (or nitrate of soda or potash) refined, or partially refined	10	8
Sponges	20	8
Sulphuric acid or oil of vitriol	10	8
Tallow, marrow, and all other

Ratans and reeds, unmanufactured	10	,,
Sheathing copper, but no copper to be considered such and admitted free except in sheets of 48 inches long and 14 inches wide, and weighing from 14 to 34 ounces the square foot	free	,,
Sheathing metal, not wholly or in part of iron, ungalvanized	,,	,,
Shingle bolts and stave bolts	20	,,
Silk, raw, or as reeled from the cocoon, not being doubled, twisted, or advanced in manufacture in any way	15	,,
Specimens of natural history, mineralogy or botany	free	,,
Substances expressly used for manures	20	,,
Tin, in pigs, bars or blocks	5	,,
Trees, shrubs, bulbs, plants and roots, not otherwise provided for	free	,,
Wearing apparel in actual use and other personal effects (not merchandise), professional books, implements, instruments, and tools of trade, occupation or employment of persons arriving in the U. S.: provided that this exemption shall not be construed to include machinery or other articles imported for use in any manufacturing establishment or for sale	,,	,,
Sheep's wool, unmanufactured, of the value at the port of exportation of 20 cents per lb. or less, and hair of the alpaca, the goat, and other like animals, unmanufactured: provided that any wool of the sheep or hair of the alpaca, goat, and other like animals which shall be imported in any other than the ordinary condition as now and heretofore practised, or which shall be changed in its character for the purpose of evading the duty, or which shall be reduced in value by the intentional admixture of dirt or any foreign substance to 20 cents per lb. or less, shall be subject to a duty of 24 per centum *ad valorem*, anything in this act to the contrary notwithstanding	* 30 & 20	,,

* Sheep's wool, 30 per centum; hair of the alpaca, the goat, and other like animals, 20 per centum.

§ 4. And be it further enacted, That all goods, wares and merchandise which shall be imported from foreign countries after the passage of this act, and be in the public stores on the first day of July aforesaid, shall be subject, on entry thereof for consumption, to no other duty than if the same had been imported, respectively, after that day.

§ 5. And be it further enacted, That on the entry of any goods, wares and merchandise imported on and after the first day of July aforesaid, the decision of the collector of the customs at the port of importation and entry, as to their liability to duty or exemption therefrom, shall be final and conclusive against the owner, importer, consignee, or agent of any such goods, wares and merchandise, unless the owner, importer, or consignee, or agent, shall, within ten days after such entry, give notice to the collector, in writing, of his dissatisfaction with such decision, setting forth therein, distinctly and specifically his grounds of objection thereto, and shall, within thirty days after the date of such decision, appeal therefrom to the Secretary of the Treasury, whose decision on such appeal shall be final and conclusive; and the said goods, wares and merchandise shall be liable to duty or exempted therefrom accordingly, any act of Congress to the contrary notwithstanding, unless suit shall be brought within thirty days after such decision for any duties that may have been paid or may therefore be paid on said goods, or within thirty days after the duties shall have been paid in cases where such goods shall be in bond.

An Act for establishing a Warehousing System in U. States.

The following is an official copy of an act passed by both Houses of Congress, July, 1846, and signed by the President of the United States on the 6th of August, 1846:

An Act establishing a Warehousing System, and to amend an Act entitled "An Act to provide Revenue from Imports, and to change and modify existing Laws imposing Duties on Imports, and for other Purposes."

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that the twelfth section of the Act entitled "An act to provide revenue from imports, and to change and modify existing laws imposing duties on imports, and for other purposes," approved the 30th day of August, 1842, is hereby amended so as hereafter to read as follows:—[Sec. 12.] and be it further enacted, that on and after the day this act goes into operation, the duties on all imported goods, wares, or merchandise, shall be paid in cash: Provided, that in all cases of failure or neglect to pay the duties within the period allowed by law to the importer to make entry thereof, or whenever the owner, importer, or consignee shall make entry for warehousing the same in writing, in such form and supported by such proof as shall be prescribed by the Secretary of the Treasury, the said goods, wares, or merchandise shall be taken possession of by the collector, and deposited in the public stores, or in other stores to be agreed on by the collector or chief revenue officer of the port and the importer, owner, or consignee, the said stores to be secured in the manner provided for by the first section of the act of the 20th day of April, 1818, entitled "An act providing for the deposit of wines and distilled spirits in public warehouses, and for other purposes," there to be kept with due and reasonable care, at the charge and risk of the owner, importer, consignee, or agent, and subject at all times to their order upon payment of the proper duties and expenses, to be ascertained on due entry thereof for warehousing, and to be secured by bond of the owner, importer, or consignee, with surety or sureties, to the satisfaction of the collector in double the amount of the said duties, and in such form as the Secretary of the Treasury shall prescribe: provided that no merchandise shall be withdrawn from any warehouse in which it may be deposited in a less quantity than in an entire package, bale, cask, or box, unless in bulk; nor shall merchandise so imported in bulk be delivered, except in the whole quantity of each parcel, or in a quantity not less than 1 ton weight, unless by authority of the Secretary of the Treasury. And in case the owner, importer, consignee, or agent of any goods on which the duties have not been paid shall give to the collector satisfactory security that the said goods shall be landed out of the jurisdiction of the United States, in the manner now required by existing laws relating to exportations for the benefit of drawback, the collector and naval officer, if any, on an entry to re-export the same, shall, upon payment of the appropriate expenses, permit the said goods, under the inspection of the proper officers, to be shipped without payment of any duties thereon. And in case any goods, wares, or merchandise, deposited as aforesaid, shall remain in public store beyond 1 year, without payment of the duties and charges thereon, then said goods, wares, or merchandise shall be appraised by the appraiser of the United States, if there be any at such port, and if none, then by two merchants to be designated and sworn by the collector for that purpose, and sold by the collector at public auction, on due public notice thereof being first given in the manner and for the time to be prescribed by a general regulation of the Treasury Department; and at said public sale, distinct and printed catalogues descriptive of said goods with the appraised value affixed thereto, shall be distributed among the persons present at said sale; and a reasonable opportunity shall be given before such sale, to persons desirous of purchasing, to inspect the quality of such goods; and the proceeds of said sales, after deducting the usual rate of storage at the port in question, with all other charges and expenses, including duties, shall be paid over to the owner, importer, consignee, or agent, and proper receipts taken for the same; provided that the overplus, if any there be, of the proceeds of such sales, after the payment of storage, charges, expenses, and duties as aforesaid, remaining unclaimed for the space of 10 days after such sales shall be paid by the collector into the treasury of the United States; and the said collector shall transmit to the Treasury Department, with the said overplus, a copy of the inventory, appraisement, and account of sales, specifying the marks, numbers, and descriptions of the packages sold, their contents, and appraised value, the name of the vessel and master in which, and of the port or place whence they were imported, and the time when, and the name of the person or persons to whom, said goods were consigned in the manifest, and the duties and charges to which the several consignments were respectively subject, and the receipt or certificate of the collector shall exonerate the master or person having charge or command of any ship or vessel in which said goods, wares, or merchandise were imported, from all claims of the owner or owners thereof, who shall, nevertheless, on due proof of their interest, be entitled to receive from the Treasury the amount of any overplus paid into the same under the provisions of this act: provided, that so much of the 56th section of the general collection law of the 2nd of March, 1799, and the 13th section of the act of the 30th of August, 1842, to provide revenue from imports, and to change and modify existing laws imposing duties on imports, and for other purposes, as conflicts with the provisions of this act, shall be, and is hereby repealed, excepting that nothing contained in this act shall be construed to extend the time now prescribed by law for selling unclaimed goods: provided, also, that all goods of a perishable nature, and all gunpowder, firecrackers, and explosive substances, deposited as aforesaid, shall be sold forthwith.

Sec. 2. Any goods when deposited in the public stores in the manner provided for in the foregoing section, may be withdrawn therefrom and transported to any other port of entry, under the restrictions provided for in the act of the 2nd March, 1799, in respect to the transportation of goods, wares, and merchandise from one collection district to another, to be exported with the benefit of drawback; and the owner of such goods so to be withdrawn for transportation, shall give his bond with sufficient sureties, in double the amount of the duties chargeable on them, for the deposit of such goods in store in the port of entry to which they shall be destined, such bond to be cancelled when the goods shall be re-deposited in store in the collection district to which they shall be transported: provided, that nothing contained in this section shall be construed to extend the time during which goods may be kept in store after their original importation and entry, beyond the term of 1 year.

Sec. 3. If any warehoused goods shall be fraudulently concealed in or removed from any public or private warehouse, the same shall be forfeited to the United States; and all persons convicted of fraudulently concealing or removing such goods, or of aiding or abetting such concealment or removal, shall be liable to the same penalties which are now imposed for the fraudulent introduction of goods into the United States; and if any importer or proprietor of any warehoused goods, or any person in his employ, shall by any contrivance fraudulently open the warehouse, or shall gain access to the goods, except in the presence of the proper officer of the customs, acting in the execution of his duty, such importer or proprietor shall forfeit and pay, for every such offence, 1000 dollars. And any person convicted of altering, defacing, or obliterating any mark or marks which have been placed by any officer of the revenue on any package or packages of warehoused goods, shall forfeit and pay, for every such offence, 500 dollars.

Sec. 4. The collectors of the several ports of the United States shall make quarterly reports to the Secretary of the Treasury, according to such general instructions as the said Secretary may give, of all goods which remain in the warehouses of their respective ports, specifying the quantity and description of the same; which returns, or tables formed thereon, the Secretary of the Treasury shall forthwith cause to be published in the principal papers of the city of Washington.

Sec. 5. The Secretary of the Treasury be, and he is hereby authorised to make, from time to time, such regulations, not inconsistent with the laws of the United States, as may be necessary to give full effect to the provisions of this act, and secure a just accountability under the same. And it shall be the duty of the Secretary to report such regulations to each succeeding session of Congress.

The following Treasury Circular will be found of great importance to merchants who consign or otherwise ship goods to the United States:—

Treasury Department, Washington, July 16. 1851.

The existing revenue laws of the U. States provide that the value of all foreign merchandise imported into the U. States shall be verified by the oath of the owner thereof. Where the goods are owned by the parties residing in the U. States, this oath is taken before the collector at the time of entry, and where they wholly belong to a person or persons not residing at the time in the U. States, the invoice is required to be verified by the oath of the owner, to be administered by a Consul or Commercial Agent of the U. States, or by some public officer *duly authorised to administer* oaths in the country where the goods are purchased.

In the latter case certificates of the public officer who administered the oath must be authenticated by a consul or commercial agent of the U. States in the port from which the goods are imported.

In a circular from the department of the 7th of April, 1851, to the American consuls and commercial agents, which has been generally published in the public journals of the U. States, and which the consuls abroad were instructed to make public at the places of their respective residences, notice was given of the intended change of action by the department on the subject after a reasonable delay.

The time for this change, the department thinks, has arrived, and collectors are required and instructed to observe and enforce the following rules on the subject:—

In all future importations of merchandise for account of non-resident owners, where the invoices are not accompanied by consular certificates, as required by law, the goods must be sent to the public stores, there to remain at the expense and risk of the owners, until a certificate shall be produced; and

no bonds will be taken as heretofore for the production of such certificates.

When, however, such goods are of a perishable nature, or what are called fancy or seasonable goods, or where the sale would be materially injured by the delay of the department, unless there is obvious evidence of intended fraud; the report of the facts of the importer, certified by the collector, will admit them to entry on such terms as the facts and circumstances of each case respectively may render necessary and proper.

Some of the foreign shippers and manufacturers are in the habit of sending a consular certificate attached to a general invoice of goods, part of which only come in the vessel with the certificate, and the balance being intended for future shipment by some vessel or vessels, and in many instances, as the department is advised, such goods are not even manufactured at the time the invoice is dated and the certificate granted.

In future no such certificate is to be respected, except for goods which actually accompany it, and any other portion of the invoice which may come by any other or subsequent vessels, will be treated as being without consular certificates, unless there be a distinct and separate one for goods by each vessel.

In all cases where bonds heretofore given for the production of consular certificates remain uncancelled, and the time for producing them has expired, the parties are to be notified in writing to pay the amount of such uncancelled bonds; and on a failure to do so within thirty days after such notice, will be immediately put into suit.

Should there be any of these cases where the collector thinks, from the peculiar circumstances, that further time should be wanted for the production of the certificate, the department, on presentation of facts of the case, will take such cases into consideration, and if the circumstances will warrant it, grant the additional time required, under such terms and conditions as it may think advisable and just to exact.

Collectors will use every diligence to prevent the entry of merchandise as the property of residents where it may be for foreign account, and whenever they may detect deception or fraud in entering goods without the oath of the real owners, will enforce the utmost penalty of the law against the offending parties.

By the habit which has generally prevailed of virtually dispensing with the oath of non-resident owners of foreign merchandise, these latter have possessed undue advantage over resident importers of the U. States.

A just regard for the rights and interests of the latter, as well as for the more faithful collection of the revenue, has governed the action of the department in establishing the rules laid down in the present circular.

(Signed) WM. L. HODGE,
Acting Secretary of the Treasury

The value of the exports of British produce to California, in 1857, amounted to 433,082*l.*

NICARAGUA OR PEACH WOOD (Ger. *Nicaragaholz, Blutholtz;* Du. *Bloedhaut;* Fr. *Bois de sang, Bois de Nicarague;* It. *Legno sanguigno;* Sp. *Palo de sangre;* Port. *Pao sanguinho*), a tree of the same genus (*Cæsalpinia*) as the Brazil and sapan wood; but the species has not been exactly ascertained. It grows principally in the vicinity of the lake of Nicaragua, whence its name.

It is said by Dr. Bancroft to be almost as red and heavy as the true Brazil wood, but it does not commonly afford more than a third part, in quantity, of the colour of the latter; and even this is rather less durable and less beautiful, though dyed with the same mordants. Nicaragua or peach woods differ greatly in their quality as well as

price; one sort being so deficient in colouring matter, that 6 pounds of it will only dye as much wool or cloth as 1 pound of Brazil wood; while another variety of it will produce nearly half the effect of an equal quantity of Brazil wood, and will sell proportionally dear.—(*Bancroft on Colours*, vol. ii. p. 332.)

The London dealers distinguish Nicaragua wood into 3 sorts, viz. *large*, *middling*, and *small*; the price of the first sort being from 15*l.* to 18*l.* per ton; of the 2d, from 7*l.* to 10*l.* per do.; and of the 3d, from 6*l.* to 7*l.* per do. The duty, after being reduced in 1831 from 15*s.* to 5*s.* a ton, and in 1842 to 2*s.* per do., was wholly abolished in 1844. The imports of Nicaragua wood amounted in 1857 to 2,676 tons, the exports during the same year being 747 tons.

NICKEL, a scarce metal, which occurs always in combination with other metals, from which it is exceedingly difficult to separate it. When pure, it is of a fine white colour resembling silver. It is rather softer than iron: its specific gravity, when cast, is 8·279; when hammered, 8·932. It is malleable, and may without difficulty be hammered into plates not exceeding $\frac{1}{100}$th part of an inch in thickness. It is attracted by the magnet; and is not altered by exposure to the air, nor by being kept under water. It is employed in potteries, and in the manufacture of porcelain.—(*Thomson's Chemistry.*)

NITRE. See SALTPETRE.

NOTE, PROMISSORY. See BANKING, and BANKS.

NUT, OR HAZEL NUT (Ger. *Haselnusse*; Fr. *Noisettes*, *Avelines*; It. *Naccinole*, *Avelane*; Sp. *Avellanas*; Port. *Avellãas*; Lat. *Avellanæ*), the fruit of different species of *Coryli*, or hazels. The kernels have a mild, farinaceous, oily taste, agreeable to most palates. A kind of chocolate has been prepared from them; and they have sometimes been made into bread. The expressed oil of hazel nuts is little inferior to that of almonds. Besides those raised at home, we import nuts from different parts of France, Portugal, and Spain, but principally from the latter. The Spanish nuts in the highest estimation, though sold under the name of Barcelona nuts, are not really shipped at that city, but at Tarragona, a little more to the south. Mr. Inglis says that the annual average export of nuts from Tarragona is from 25,000 to 30,000 bags, of 4 to the ton. They cost, free on board, in autumn, in 1830, 17*s.* 6*d.* per bag.—(*Spain in* 1830, vol. ii. p. 362.) In 1857, 185,114 bushels of hazel nuts were admitted to home consumption. The duty of 2*s.* 1$\frac{1}{2}$*d.* per bushel was reduced in 1853 to 1*s.* a bushel.

NUTS (GROUND) (*Arachis hypogæa*), known in French commerce as "*arachides*," in America as pea-nuts, and in Africa as *Mandubim*, the fruit of a papilionaceous plant, rising to the height of about 15 inches, being very like the field pea, with yellow flowers. The branches after flowering bend down till they touch the ground, into which they work themselves, and upon them grow the pods that contain the nuts. When the nuts are ripe, the plant dies. It is then pulled up, and the nuts which adhere to the twigs are collected. The pods, which are of an elongated figure, about $\frac{3}{4}$ inch in length, and $\frac{1}{2}$ inch in circumference, and brittle, usually contain 2 nuts, but sometimes only 1, and very rarely 3. They are elliptical at one end and flattened at the other.

Ground-nuts are grown in light sandy soils in most tropical countries. They have been used as food from time immemorial in Africa, India, Brazil, and other parts both of S. and N. America. The best are raised on the banks of the river Gambia, where they are extensively grown in large fields, the ground being prepared for their reception by the natives after the rude fashion of the country. The plant is very prolific; it is also said to be highly exhaustive of the soil, though this is, perhaps, questionable.

Ground nuts yield large quantities of oil; and within the last twenty years they have begun to be grown in Africa as an article of commerce, and are now largely exported for crushing. A mill for expressing oil from them was constructed in London in 1835. But the French government having a few years after imposed high duties on most descriptions of oil seeds, the oil crushers of Marseilles and other towns endeavoured to find out seeds not included in the tariff, or less heavily taxed than the others. They were thus led to import *arachides* or ground nuts, which they found to answer extremely well. France has, in consequence, become the great market for this peculiar product. The exports from the Gambia which, in 1835, did not exceed 47 tons, had increased in 1851 to not less than about 12,000 tons. Of this quantity about 800 tons went to the U. States, (where they are eaten at dessert, roasted, as are chestnuts elsewhere,) 700 to England, and the rest to France, principally to Marseilles. The total imports of *arachides* into France in 1851 amounted, according to the official returns, to 16,472,562 kilog., or 16,180 tons.

Nuts are, also, exported from the Rio Grande, the Rio Nunez, and from Sierra Leone, and the adjoining rivers. And though there are no accounts of the exact quantities sent from each, it is believed that their aggregate amount is fully equal to the exports from the Gambia. Within the last 3 or 4 years considerable quantities have been shipped from the Senegal river.

The oil expressed from the nuts differs in quality and price according to the care with which it is refined. That made in London, which is equal to fine olive oil, sold, in 1853, at from 60*l.* to 62*l.* a ton. In France the oil is principally used in the manufacture of soap; and being inferior to that made here is worth from 45*l.* to 48*l.* a ton.

Besides being used for the like purposes as other oil in food, in the woollen manufacture, and in lamps, the oil of ground nuts is said to be especially well fitted for lubricating heavy machinery, inc. the locomotive engines on railways. The Belgians use it for this latter purpose in preference to all other oils.

Ground nuts are worth at present (September 1853) from 380 fr. to 390 fr. per 1,000 kilog. (a ton) in Marseilles; 13*l.* 15*s.* a ton in London; and from 9*l.* to 10*l.* a ton delivered to a French ship in the Gambia. Sierra Leone nuts bring from 1*l.* to 2*l.* less than those from the Gambia.

We have been obligingly furnished with these valuable details by John Forster, Esq., M.P., whose house has been mainly instrumental in developing this new and important branch of commerce.

NUTMEG (Ger. *Muskatennüsse*; Du. *Muskaät*; Fr. *Muscades*, *Noix muscades*; It. *Noce muscada*; Sp. *Moscada*; Arab. *Jowzalteib*; Sans. *Jātiphala*; Malay, *Buah-pala*), the fruit of the genuine nutmeg tree (*Myristica Moschata*), a native of the Moluccas, but which has been transplanted to Sumatra, Penang, &c. An inferior and long-shaped nutmeg is common in Borneo; but the fruit nowhere attains to the same perfection as in the Moluccas.

Of the several varieties of the tree, that denominated the Queen Nutmeg, which bears a small round fruit, is the best. The kernel, or proper nutmeg, is of a roundish oval form, marked on the outside with many vermicular furrows, within of a fleshy farinaceous substance, variegated whitish and bay. Nutmegs are frequently punctured and boiled, in order to obtain the essential oil; the orifice being afterwards closed; but the fraud is easily detected by the lightness of the nutmeg.—(*Thomson's Dispensatory*; *Ainslie's Materia Indica.*)

Nutmegs should be chosen large, round, heavy, and firm, of a lightish grey colour on the outside, and the inside beautifully marbled, of a strong fragrant smell, warm aromatic taste, and a flat oily body. They are very subject to be worm-eaten. The best manner of packing them is in dry chunam. The oblong kind, and the smaller ones, should be rejected. 15 cwt. are allowed to a ton.—(*Milburn's Orient. Com.*)

The dried produce of a nutmeg tree consists of nutmeg mace (which see), and shell. Supposing the whole produce to be divided into 100 parts, there are 13⅓ of mace, 33⅓ of shell, and 53⅓ of nutmeg. In the ancient commerce, and down to the establishment of the Dutch monopoly, nutmegs were always sold and exported in the shell. The natives, whenever the commerce is left to their management, continue the practice, which is strongly recommended by Mr. Crawfurd.—(*Eastern Archipelago*, vol. iii. p. 396.)

The jealous policy of the Dutch has reduced the trade in nutmegs to a mere trifle, compared to what it would otherwise have been. They have, in so far at least as it was possible, exerted themselves to exterminate the nutmeg plants every where except in Banda. The aboriginal inhabitants of this island have been expatriated, and the land parcelled among settlers from Holland, under the name *park keepers*. These persons have about 2,000 slaves, who cultivate and prepare the nutmegs. The prices paid by the cultivator are all fixed by government: and it deserves to be mentioned, as affording one of the most striking illustrations of the ruinous effects of monopoly, that the fixed price which the government is now obliged to pay for nutmegs is FIVE *times greater than the price at which they bought them when the trade was free!* We cannot conceive how so enlightened and liberal a government as that of Holland should continue to tolerate such scandalous abuses, more especially since it has established a free system in Amboyna, Java, and its other possessions.

M. Temminck estimates the produce of the Banda Islands at about 600,000 lbs. of nutmegs, and 160,000 lbs. of mace.—(*Possessions Neerlandaises dans l'Inde Archipelagique*, iii. 283.)

During the period that the English had possession of the Spice Islands, nutmeg plants were carried to Penang, Bencoolen, and some of the West India islands. In the latter they have altogether failed, at least as far as respects any useful purpose; but very good nutmegs, and in considerable quantities, are now raised at Penang and Bencoolen. Mr. Crawfurd, however, alleges that the cost of bringing them to market is there so high, that the restoration of a free culture in the native country of the nutmeg would instantly destroy this unstable and factitious branch of industry.—(*Eastern Archipelago*, vol. iii. p. 409.)

The duty on nutmegs was reduced, in 1819, from 5*s.* 5*d.* to 2*s.* 6*d.* per lb.; and the quantities entered for home consumption have since rapidly increased. In 1857, 181,061 lbs. nutmegs were entered for consumption. In 1853 the duty was reduced to 1*s.* per lb., and to 3*d.* and 5*d.* per lb. respectively on wild nutmegs in the shell and not in the shell.

NUTRIA, OR NEUTRIA, the commercial names for the skins of *Myopotamus Bonariensis* (Commerson), the *Coypou* of Molina, and the *Quoiya* of D'Azara. In France, the skins were, and perhaps still are, sold under the name of *racoonda*; but in England they are imported as *nutria* skins — deriving their appellation, most probably, from some supposed similarity of the animal which produces them, in appearance and habits, to the otter, the Spanish name for which is nutria. Indeed, Molina speaks of the *coypou* as a species of water rat, of the size and colour of the otter.

Nutria fur is largely used in the hat manufacture; and has become, within the last 15 or 20 years, an article of very considerable commercial importance. The imports fluctuate considerably. In 1841 they

amounted to 1,125,212 skins; but in some years they are much less; and, in 1840, amounted to only 242,733. Those entered for home consumption pay a duty of 1s. per 100 skins. They are principally brought from the Rio de la Plata.—(See FUR TRADE.)

The *coypou* or *quoiya* is a native of S. America, very common in the provinces of Chili, Buenos Ayres, and Tucuman, but more rare in Paraguay. In size it is less than the beaver, which it resembles in many points. The head is large and depressed, the ears small and rounded, the neck stout and short, the muzzle sharper than that of the beaver, and the whiskers very long and stiff. There are, as in the beaver, 2 incisor teeth, and 18 molar, above and below—20 teeth in all. The limbs are short. The fore feet have each 5 fingers not webbed, the thumb being very small: the hind feet have the same number of toes; the great toe and 3 next toes being joined by a web which extends to their ends, and the little toe being free, but edged with a membrane on its inner side. The nails are compressed, long, crooked, and sharp. The tail, unlike that of the beaver, is long, round, and hairy; but the hairs are not numerous, and permit the scaly texture of the skin in this part to be seen. The back is of a brownish red, which becomes redder on the flanks: the belly is of a dirty red. The edges of the lips and extremity of the muzzle are white.

Like the beaver, the coypou is furnished with 2 kinds of fur; viz. the long ruddy hair which gives the tone of colour, and the brownish ash-coloured fur at its base, which, like the down of the beaver, is of much importance in hat making, and the cause of the animal's commercial value.

The habits of the coypou are much like those of most of the other aquatic rodent animals. Its principal food, in a state of nature, is vegetable. It affects the neighbourhood of water, swims perfectly well, and burrows in the ground. The female brings forth from 5 to 7 at a time; and the young always accompany her.

The coypou is easily domesticated, and its manners in captivity are very mild.

*** We are indebted for this account of nutria — the first, we believe, that appeared in any English work — to W. J. Broderip, Esq., F.R.S., &c.

NUX VOMICA (Fr. *Noix Vomique*; Hind. *Kaachla*), the fruit of a species of *Strychnos*, growing in various places in the East Indies.

The fruit is about the size of an orange, covered with a smooth crustaceous yellow bark, and filled with a fleshy pulp, in which are imbedded several orbicular flatted seeds, about ¾ of an inch in diameter. Nux vomica is inodorous, and has a very bitter, acrid taste, which remains long on the palate. It is known as a very virulent poison. A suspicion has, however, been entertained, that it has been used in porter breweries; but its introduction into them is prohibited under heavy penalties. — (*Thomson's Dispensatory, &c.*)

O.

OAK (Ger. *Eiche*; Du. *Eik*; Da. *Eeg*; Sw. *Ek*; Fr. *Chêne*; It. *Quercia*; Sp. *Roble, Carballo*; Port. *Roble, Carbalho*; Rus. *Dub*; Pol. *Dab*; Lat. *Quercus*; Arab. *Baalut*). There are several varieties of this valuable tree; but the common English oak (*Quercus robur*) claims precedence of every other. The oak timber imported from America is very inferior to that of this country: the oak from the central parts of Europe is also inferior, especially in compactness and resistance of cleavage. The knotty oak of England, the "unwedgeable and gnarled oak," as Shakespeare called it, when cut down at a proper age (from 50 to 70 years), is the best timber known. Some timber is harder, some more difficult to rend, and some less capable of being broken across; but none contains all the three qualities in so great and equal proportions; and thus, for at once supporting a weight, resisting a strain, and not splintering by a cannon shot, the timber of the oak is superior to every other.

A fine oak is one of the most picturesque of trees; it conveys to the mind associations of great strength, and of all but endless duration. It stands up against the blast, and does not take, like other trees, a twisted form from the action of the winds. Except the cedar of Lebanon, no tree is so remarkable for the stoutness of its limbs; they do not exactly spring from the trunk, but divide from it; and thus it is sometimes difficult to know which is stem and which is branch. The twisted branches of the oak, too, add greatly to its beauty; and the horizontal direction of its boughs, spreading over a large surface, completes the idea of its sovereignty over all the trees of the forest. Even a decayed oak, such as that described by Spenser—

> "——————— dry and dead,
> Still clad with reliques of its trophies old,
> Lifting to heaven its aged, hoary head,
> Whose foot on earth has got but feeble hold,"

is strikingly beautiful. To such an oak Lucan compared Pompey in his decline:—

> "Qualis frugifero quercus sublimis in agro
> Exuvias veteres populi, sacratasque gestans
> Dona ducum; nec jam validis radicibus hærens,
> Pondere fixa suo est; nudosque per aëra ramos
> Effundens, trunco, non frondibus, efficit umbram.
> At quamvis primo nutet casura sub Euro,
> Tot circum silvæ firmo se róbore tollant,
> Sola tamen colitur." — (Lib. i. lin. 136.)

The oak is raised from acorns, sown either where the oak is to stand, or in a nursery, whence the young trees are transplanted.

The colour of oak wood is a fine brown, and is familiar to every one; it is of different shades; that inclined to red is the most inferior. The larger transverse septa are in general very distinct, producing beautiful flowers when cut obliquely. Where the septa are small, and not very distinct, the wood is much the strongest. The texture is alternately compact and porous; the compact part of the annual ring being of the darkest colour, and in irregular dots surrounded by open pores, producing beautiful dark veins in some kinds, particularly pollard oaks. Oak timber has a particular smell, and the taste is slightly astringent. It contains gallic acid, and is blackened by contact with iron when it is damp. The young wood of English oak is very tough, often cross-grained, and difficult to work. Foreign wood, and that of old trees, is more brittle and workable. Oak warps and twists much in drying; and, in seasoning, shrinks about $\frac{1}{32}$d of its width.

Oak of a good quality is more durable than any other wood that attains a like size. Vitruvius says it is of eternal duration when driven into the earth: it is extremely durable in water; and in a dry state it has been known to last nearly 1,000 years. The more compact it is, and the smaller the pores are, the longer it will last; but the open, porous, and foxy coloured oak, which grows in Lincolnshire and some other places, is not near so durable.

Besides the common British oak (*Quercus robur*), the sessile-fruited bay oak (*Quercus sessiliflora*) is pretty abundant in several parts of England, particularly in the north. The wood of this species is said by Tredgold to be darker, heavier, harder, and more elastic than the common oak; tough, and difficult to work; and very subject to warp and split in seasoning. Mr. Tredgold seems disposed to regard this species as superior to the common oak for ship building. But other, and also very high authorities, are opposed to him on this point; and, on the whole, we should think that it is sufficiently well established, that for all the great practical purposes to which oak timber is applied, and especially for ship building, the wood of the common oak deserves to be preferred to every other species. A well-informed writer in the *Quarterly Review* has the following remarks on the point in question: —

"We may here notice a fact long known to botanists, but of which our planters and purveyors of timber appear to have had no suspicion, — that there are two distinct species of oak in England — the *Quercus robur*, and the *Quercus sessiliflora*; the former of which affords a close-grained, firm, solid timber, rarely subject to rot; the other more loose and sappy, very liable to rot, and not half so durable. This difference was noted so early as the time of Ray; and Martyn in his *Flora Rustica*, and Sir James Smith in his *Flora Britannica*, have added their testimonies to the fact. The second species is supposed to have been introduced some 2 or 3 ages ago, from the Continent, where the oaks are chiefly of this latter species, especially in the German forests, the timber of which is known to be very worthless. But what is of more importance to us is, that *de facto* the imposture abounds, and is propagated vigorously in the New Forest and other parts of Hampshire; in Norfolk, and the northern counties, and about London; and there is but too much reason to believe that the numerous complaints that were heard about our ships being infected with what was called, improperly enough, *dry rot*, were owing to the introduction of this species of oak into the naval dock-yards, where, we understand, the distinction was not even suspected. It may thus be discriminated from the true old English oak: — The acorn stalks of the *robur* are *long*, and its leaves *short*; whereas the *sessiliflora* has the acorn stalks *short*, and the leaves *long*: the acorns of the former grow singly, or seldom two on the same footstalk; those of the latter, in clusters of 2 or 3 close to the stem of the branch. We believe the Russian ships of the Baltic, that are not of larch or fir, are built of this species of oak; but if this were not the case, their exposure on the stocks, without cover, to the heat of summer, which, though short, is excessive, and the rifts and chinks which fill up with ice and snow in the long winter, are enough to destroy the stoutest oak, and quite sufficient to account for their short-lived duration."

A great deal of inquiry and discussion has taken place at different periods as to the supply and consumption of oak timber; but the results have not been very satisfactory. In a *Report of the Commissioners of Land Revenue*, printed in 1812, it is stated that, taking the tonnage of the navy in 1806 at 776,087 tons, it would require, at 1½ load to a ton, 1,164,085 loads to build such a navy; and supposing the average duration of a ship to be 14 years, the annual quantity of timber required would be 83,149 loads, exclusive of repairs, which they calculate would be about 27,000 loads; making the whole about 110,000 loads: of which, however, the commissioners reckon may be furnished 21,341 loads as the annual average of the prizes; and of the remaining 88,659 loads, they think it not unreasonable to calculate on 28,659 from other sources than British oak. "This," they observe, "leaves 60,000 loads of such oak, as the quantity which would be sufficient annually to support, at its present unexampled magnitude, the whole British navy, including ships of war of all sorts; but which may be taken as equivalent together to 20 14-gun ships, each of which, one with another, contains about 2,000 tons, or would require, at the rate of ⅔ load to the ton, 3,000 loads; making just 60,000 loads for 20 such ships."

Now, it has been supposed that not more than 40 oak trees can stand on an acre of ground, so as to grow to a full size fit for ships of the line, or to contain each 1½ load of timber; 50 acres, therefore, would be required to produce a sufficient quantity of timber to build a 74-gun ship, and 1,000 acres, for 20 such ships; and as the oak requires at least 100 years to arrive at maturity, 100,000 acres would be required to keep up a successive supply, for maintaining a navy of 700,000 or 800,000 tons. The commissioners further observe, that as there are 20,000,000 acres of waste lands in the kingdom, a 200th part set aside for planting would at once furnish the whole quantity wanted for the use of the navy.

According to Mr. Barrow, this calculation is over-rated by about a half. "In the first place," says he, "it supposed a state of perpetual war, during which the tonnage of the whole navy is considered as more than double of what it now actually is: and, in the second place, it reckons the average duration of the navy at 14 years only; which, from the improvements that have taken place in the construction and preservation of ships of war, with the resources of teak ships built in India, we should not hesitate in assuming at an average of twice that number of years; and if so, the quantity of oak required for the navy will be nothing like that which the commissioners have stated.

"The fact, however, is certain, that long before the conclusion of the late war, a scarcity begun to be felt, especially of the larger kind of timber fit for ships of the line; and so great was this scarcity, that if Sir Robert Seppings had not contrived the means of substituting straight timber for that of different forms and dimensions, before considered to be indispensable, the building of new ships must entirely have ceased.

"If, however, the growth of oak for ship timber was greatly diminished during the war, so as to threaten an alarming scarcity, there is little doubt that, from the increased attention paid by individuals to their young plantations, and their great extension, as well as from the measure of allotting off portions of the royal forests to those who had claims on them, and inclosing the remainder for the use of the public, this country will, in future times, be fully adequate to the production of oak timber equal to the demand for the naval and mercantile marine." — (*Ency. Brit.* art. *Navy.*)

The bark of the oak tree is very valuable. It is preferred to all other substances for the purpose of tanning, and brings a high price. — (See BARK.)

The foreign oak timber imported into Great Britain is principally derived from Canada and Prussia. The latter is the most valuable — its price being to the former in the proportion of about 9 to 6; that is, if a load of Prussian oak timber brought 9*l.*, a load of Canada ditto would not bring more than about 6*l.* The quantity imported varies; but may, at an average, amount to about 10,000 loads, of 50 cubic feet each; the greater part from Quebec. Oak plank is almost wholly imported from Prussia. The quantities imported during the 6 years ending the 5th of January, 1842, were —

Years.	Loads.	Years.	Loads.	Years.	Loads.
1836	2,870	1838	3,888	1840	6,467
1837	2,198	1839	3,489	1841	2,577

For further details with respect to the importation of oak, its price, duty on, &c., see WOOD. — See, also, *Tredgold's Principles of Carpentry*; art. *Navy, Supplement to Ency. Brit.*; the very interesting work on *Timber Trees and Fruits*, in the *Library of Entertaining Knowledge*; *Rees's Cyclopædia*, &c.

OATS (Ger. *Hafer*; Du. *Haver*; Da. *Havre*; Sw. *Hafre*; Fr. *Avoine*; It. *Vena, Avena*; Sp. *Avena*; Port. *Avea*; Russ. *Owes*; Pol. *Owies*), a species of grain, the *Avena sativa* of botanists. There are innumerable varieties of this grain, some of which are said to be indigenous to Britain. It is the hardiest of all the cereal grasses, growing luxuriantly in cold northern climates, and in coarse mountainous districts, where neither wheat nor barley can be advantageously cultivated. It thrives best, and is, indeed, chiefly raised, in latitudes north of Paris; being but little known in the south of France, Spain, or Portugal. It is, however, cultivated in Bengal, so low as the 25th degree of latitude, and, it is said, with considerable success. In Scotland, where it has long formed a principal part of the food of the people, it is far more generally cultivated than any other species of grain. It is also very extensively cultivated in Ireland. In England it is grown principally in the northern counties, and in the fens of Lincoln, Huntingdon, Cambridge, and Norfolk; but the oats of Northumberland and Scotland are reckoned superior to those raised farther south.

There are 4 leading varieties of this grain cultivated in England, viz. white, black, grey, and brown or red oats. The sub varieties of the white are numerous. That denominated the potato oat is at present almost the only one raised on land in a good state of cultivation in the north of England and the south of Scotland, and usually brings a higher price in the London market than any other variety. It was accidentally discovered growing in a field of potatoes in Cumberland in 1788; and from the produce of that single stalk has been produced the stock now in general cultivation. Black and grey oats are little cultivated, except in some places in the north of Scotland. The red oat is chiefly confined to Cheshire, Derbyshire, and Staffordshire. A species of naked oats, provincially called *pillar*, is raised in Cornwall. — (*Loudon's Encyc. of Agriculture*; *Brown's Rural Economy*, vol. ii. pp. 47—52.)

In 1765, Mr. Charles Smith estimated the number of consumers of oats in England and Wales at 623,000. — (*Tracts on the Corn Trade*, 2d edit. p. 140.), but at present we believe they are very considerably fewer. The feeding of horses has at all times occasioned the greatest consumption of oats in this part of the kingdom; and as the number of horses kept for business and pleasure has been vastly increased within the last 30 or 40 years, the culture of oats has been considerably extended, notwithstanding the increasing imports from Ireland. Perhaps the produce of no species of grain varies more than that of oats. Where the ground is foul and exhausted, not more than 20 bushels an acre are obtained; but on rich soils, well managed, 64, 72, and sometimes 80 bushels and upwards have been reaped. Oats weigh from 35 to 45 lbs. a bushel, yielding at an average, 8 lbs. meal for 14 lbs. corn: but the proportion of meal increases as the oats become heavier.

For information as to the laws regulating the importation and exportation of oats, their prices, the quantities imported and exported, &c., see CORN LAWS AND CORN TRADE.

ODESSA, a sea-port of southern Russia, on the north-west coast of the Black Sea, between the rivers Dneister and Bug, in lat. 46° 28′ 54″ N., lon. 30° 43′ 22″ E. Population, in 1852, 71,392. The foundations of Odessa were laid so lately as 1792, by order of the Empress Catharine, after the peace of Jassy. It was intended to serve as an *entrepôt* for the commerce of the Russian dominions on the Black Sea and the Sea of Azoff. But being on the verge of an arid plain, at a very considerable distance from the entrance to the Sea of Azoff, and even from the mouths of the great rivers between which it is situated, we doubt whether much judgment was displayed in its selection. It has, indeed, the important advantage of having an extensive bay or roadstead, with deep water and good anchorage. The bay is, however, exposed to the south-easterly wind, which renders it less safe in winter. The port, which is artificial, being formed by 2 moles, one of which projects to a considerable distance into the sea, is fitted to contain about 300 ships. It has the advantage of deep water, but is said to be gradually filling up. There is a convenient lazaretto, on the model of that of Marseilles. The want of fresh water is a great disadvantage. There are no trees in the vicinity, which has, in consequence, a bleak and arid appearance.

Mr. Matthew, the intelligent consul for the Russian ports on the Black Sea, has recently made the following statement with respect to Odessa: —

"The neglected condition of the city, and of its harbour, and the bad state of the roads leading to the interior, must ultimately affect (unless timely remedies are applied) the commerce it now enjoys, as the natural outlet of the great grain-growing provinces of Russia.

" The town is unpaved, undrained, and inefficiently lighted by a few oil lamps; the mud in the winter, and the clouds of dust created by it in the summer, render the streets almost impassable.

" The supply of water, which each must buy, is wholly inadequate and bad, although an aqueduct and canal over 30 miles of level plain would bring the waters of the Dneister to Odessa, and would pay for itself in three years by the carriage of Bessarabian produce.

" The harbour is gradually filling up, without any efforts to prevent it, and it is impossible to avoid the conviction that the Government must desire, by the neglect of Odessa, to promote the prosperity of Theodosia, which for reasons of military policy has been preferred to Odessa for the terminus of the great Moscow Railway."

But though this state of things be sufficiently discreditable to the government and the municipality, there is not, we believe, any ground for the surmise that Odessa is being intentionally neglected. Its position is not, in truth, very favourable, either in a military or commercial point of view; and an emporium at or near the Straits of Yenikale would be at once more secure from hostile attack, and better situated for the trade of the southern provinces of the empire.

Light-houses. — A light-house has been erected on Cape Fontan, about 6½ nautical miles S. of Odessa. The light, which formerly revolved, is now *fixed*, and is about 203 (Russian) feet above the level of the sea. At the distance of 11 leagues E.S.E. ½ S. from Odessa, on the north end of the long, narrow, low island of Tendra, a light-house has been erected, of great use to ships approaching Odessa from the S. or W. The lantern is elevated 92⅛ (Russian) feet above the level of the sea. It consists of 3 reflecting lights, suspended in the form of a triangle, revolving in the space of 4 minutes, so that each lamp arrives at its maximum of brilliancy after an interval of 1 min. 20 sec. Being also of a *red* colour; this light is readily distinguished from Fontan light, and the other lights in the Black Sea. In foggy weather, a bell is kept ringing. — (*Coulier sur les Phares*, 2d ed.; *Norrie's Sailing Directions for the Mediterranean and Black Seas, &c.*)

Not being at the mouth of any great river, nor having any considerable manufactures, Odessa is not a port for the exportation of what may be called articles of native growth; but in consequence of her situation, excellent port, and the privileges she enjoyed down to a late period, she has become the emporium where a large part of the produce of Southern Russia destined for foreign countries is collected for exportation, and where most part of the foreign articles required for home consumption are primarily imported. The shallowness of the water at Taganrog, and the short period during which the Sea of Azoff is navigable, tend to hinder foreign vessels of considerable burden from entering the Strait of Yenikalé, and occasion the shipment of a considerable portion of the produce brought down the Don in lighters to Caffa and Odessa, especially the latter. All the products brought down the Dneister, the Bug, and the Dnieper, are exported from Odessa; but owing to the difficult navigation of the first and last mentioned rivers, by far the greater part of the corn brought to Odessa from Podolia, the Ukraine, &c., is conveyed to the town in carts drawn by oxen. The roads traversed by these carts are only practicable at certain seasons of the year; and nothing would contribute so much to increase the commerce of the port, and the prosperity of S. Russia, as the opening of improved communications with the interior; whether by removing obstructions in the channels of the rivers, constructing canals, or railways, or good common roads.

Monies, Weights, and *Measures*, same as at Petersburgh, which see.

The privilege of a free port conferred upon Odessa in 1817, was permitted to expire in 1856. But the change in the tariff in 1857, and the abolition which has taken place of the quarantine system, might, had they been accompanied by other necessary changes, have compensated or more for the abolition of the peculiar privileges enjoyed by the city. It is alleged, however, that the barriers by which it was formerly surrounded have not been removed, and that the foreign merchants within her limits, who have not taken the oaths of allegiance, have to become members of the 1st guild of merchants, and pay a tax of 150*l.* 12*s.* 9*d.* a year. These, no doubt, are very serious drawbacks upon the progress of the town, but we hardly think they will be maintained for any considerable period.

The great Articles of Export from Odessa consist, as every one knows, of the raw products of the soil, especially of wheat, and other varieties of corn. But wool, tallow, hides, and linens are also important articles; and to these have to be added potash, copper, caviar, cordage, wax, sail-cloth, tar, butter, furs, isinglass, &c. We subjoin

An Account of the Quantity of the principal Articles exported from Odessa in the Years 1856 and 1857, and of their Value in 1857.

Regular lines of steamers ply between Odessa and Galatz and Constantinople, the latter being, of course, connected with all the leading ports of Europe.

The exports of wheat from Odessa in 1847, amounted to 2,016,692 qrs.! This immense exportation, the greatest ever previously made in any one year from any one port, was a consequence partly of the abundant harvest of the previous year, and partly, and, perhaps, principally, of the scarcity and high prices which then prevailed in this country and other parts of W. Europe, which made every bushel be shipped that could possibly be spared. But in 1853, the year before the late war, the exports were

still greater, having amounted to 2,160,000 qrs. There is here, in truth, the greatest possible variation in the harvests. Every thing depends on the seasons.* Nature does all, man little or nothing. Agriculture is in the most backward state imaginable. No effort is made to obviate the effect of droughts and rains. And owing to the badness of the roads or paths, and the difficulty of river carriage, a considerable portion of the produce of a luxuriant crop is not brought to market or warehoused, but is allowed to go to waste. Some improvements have, no doubt, been effected, and others are in progress; but they are inconsiderable compared with what they should have been, and with what they would have been were the policy pursued by government calculated to develop the resources of the vast and fruitful countries of which Odessa is the emporium.

Observations on the Trade of Odessa in 1851. — "The exportation of rye from this port has at no time been otherwise than very limited. It is raised for local consumption, being the chief article of food of the people, and not like wheat, which is grown with the sole view of exportation. The quantity of rye shipped last year was 73,773 quarters, the whole of which went to the northern ports of continental Europe. The prices varied from 10*s.* 5*d.* to 17*s.* 5*d.* per imperial quarter, and it was the highest quotation that prevailed at the end of the year. Indian corn is become an article of exportation from Odessa only within a few years. It is the produce of Bessarabia, where its cultivation has of late been much extended in consequence of its demand for Ireland. The quantity shipped in the year was 98,252 quarters, all directed to Cork or Falmouth for orders. The prices varied from 13*s.* 7*d.* to 17*s.* 4*d.* per imperial quarter; and 16*s.* 2*d.* was the last quotation. The quantity remaining in granary was, after revision, found to be 32,000 quarters, all in the hands of exporters.

"The supplies of barley and oats have as usual been limited to local consumption.

* In proof of this allegation we may refer to a statement by Tegoborski, who says, that in the estates of the Duke of Anhalt Koethen, in Taurida, in the 10 years from 1832 to 1841, some harvests returned 15 times the seed, others barely the seed, and that one entirely failed. — *Forces Productives de la Russie*, i. 380.

"The exportation of linseed is stated in the Custom House report to be 47,875 quarters; whereas I find that 51,369 quarters were shipped for England, and 17,004 for continental ports. The last crops having been good, and grown on the near steppe lands, a large supply of the new seed has been already brought to market, and the quantity on the spot is estimated to be about 30,000 quarters, all in the hands of shippers. The prices ranged from 28*s.* 4*d.* to 35*s.* 11*d.* per imperial quarter. Large purchases were made last autumn by the crushers of Hull, for delivery next summer from the Sea of Azoff and this port; and under present circumstances both buyers and sellers are menaced by loss, for in England prices are declining, while on this side anticipations of extraordinary abundance have been disappointed.

"The tallow trade of these ports has not revived, nor is it likely to do so for some time, or till the country recovers from the immense loss of cattle carried away of late years by the distemper.

"The exportation of wool suffered a considerable decrease, having amounted only to 50,748 cwt. of all kinds, instead of 75,581 cwt. in the preceding year. To England were shipped 14,378 cwt.; to the northern continental ports 18,492 cwt.; and the remainder to the Mediterranean. The sheep flocks have been thinned by consecutive seasons of drought and deficient pasturage; and the trade has of late been more influenced by the demand for the manufactories of Moscow. The prices are kept up at their highest quotations, and they are further affected by the anticipated disturbance of labour in Australia.

"The amount of shipping did not much differ from that of 1850; 698 vessels arrived measuring 196,218 tons, of which 126 were British, burden 37,531 tons; and 729 vessels measuring 203,842 tons departed, of which 130 were British, burden 38,830 tons. Of the 242 vessels bound to England with cargoes, 110 were British. The preference is still given to our flag, particularly in the boisterous seasons. The Austrian ships of the Adriatic are, however, in great favour, especially for grain cargoes. The rates of freights to England varied from 1*l.* 15*s.* to 3*l.* 5*s.* per ton, or from 5*s.* 5*d.* to 10*s.* per imperial quarter; and the highest rates prevailed during the last three months, offering a fair remuneration to shipowners. The average exchange on London was 6 30 rs. for the pound sterling. The money market was generally easy with limited operations; and credit is at present sound, though restricted in consequence of the great losses incurred in the grain trade by the Greek houses. It is worthy of remark, that not one of these houses has failed, notwithstanding their severe trials."

A tribunal of commerce was established at Odessa in 1824, whose jurisdiction extends over all disputes connected with trade. There is no appeal from its decisions except to the Senate. There are 12 sworn brokers, approved and licensed by the Tribunal of Commerce, who have deputies appointed by themselves. They register all transactions, and receive ½ per cent. from each party as commission. There is a discount or loan bank, established in 1828, and marine and fire insurance societies. Most articles of provision are cheap; and fish, which costs next to nothing, is excellent. Fuel, however, is scarce and dear.

Within the last 30 years, the Merino breed of sheep has been extensively introduced into the governments of Taurida, Cherson, and Ekaterinoslov; so that there has been not only a great increase in the quantity, but also a very decided improvement in the quality, of the wool exported.

Corn Trade.— The principal trade of Odessa is with Constantinople, Smyrna, and other towns in the Levant, Naples, Leghorn, Genoa, Marseilles, &c. "It is generally stated," says Mr. Jacob (*Memoir on the Trade of the Black Sea*, in the *Appendix* to the 8vo edition of *Tracts on the Corn Trade*), "that the supply of Constantinople requires annually 100,000 quarters of Black Sea wheat. The Greek islands scarcely, on the average of years, produce sufficient wheat for their own consumption, and, in some years, require a large supply, which is furnished partly from the neighbouring continent, and partly from the Black Sea.

"The Asiatic coasts of the Turkish Empire, especially in Anatolia, are nearly in the same predicament. At times, the market of Smyrna is very favourable for the sale of the corn of Southern Russia. The islands of Malta and Gozo produce only about half as much corn as the 120,000 inhabitants require.

"Sicily, though it has greatly declined from its ancient productiveness, has still a quantity of grain to spare for the less fruitful parts of Italy, in most years; and its wheat enters into competition with that of the Black Sea, in the ports of Naples, Genoa, and Leghorn.

"There are few years in which Tuscany grows a sufficiency of wheat; and its chief port, Leghorn, being one of those in which ships can unload their cargoes of corn, without being detained to perform quarantine, has been at all times a place of deposit for the wheat of the Black Sea. A market at some price may always be found there, as the capitalists are disposed to purchase; relying on the uncertain productiveness of some adjacent country, in which they may realise a profit at no great distance.

"Genoa, like Leghorn, is a port where wheat can be unloaded within the bounds of the lazaretto. The country around it yields but little wheat: and, at some periods, it enjoys a trade in that article even as far as Sunderland. This internal demand, and the chance of advantageous re-exportation, induces much trade in corn. There is said to be seldom less than 100,000 quarters in store at the two ports of Genoa and Leghorn; and at some periods, a far greater quantity.

"Nice, though not having the same advantageous quarantine regulations, and, consequently, not being a *depôt* for corn beyond its own demand, from the sterile soil that surrounds it, requires every year a large importation of wheat. That of Sicily and Odessa create a competition in its port; and the government draws a revenue, by imposing a heavy duty on both.

"Though the corn laws of France have kept the ports closed against the introduction of foreign corn for domestic use, yet it is allowed to be bonded for re-exportation. From the frequent local and partial scarcities which occur on the eastern coast of Spain, at which periods wheat is allowed to be lawfully imported, and, it is said, from the facility of its introduction by contraband, when not legally allowed, Marseilles has been a great *depôt* for the wheat of the Black Sea.

"From thence, as also from Gibraltar, where there is generally some in store, it can easily be trans-

ported to Spain, to Sardinia, to Corsica, to Tunis, to Tripoli, or wherever scarcity has created a beneficial market.

"The coasts of Barbary, though often having a surplus of wheat, much of which occasionally assists to feed Portugal, in some seasons have been affected with most deficient harvests. This was recently the case in a remarkable degree. Tripoli and Tunis experienced, in the year 1820, a harvest most miserably short, and were supplied from other countries."

Charges on Shipping Corn. — In 1852, the expenses of delivering a quarter of wheat free on board, including commission, warehouse rent, and shipping charges, amounted to about 2*s.* 2*d.*

The warehouse rent of corn at Odessa is from 8 to 10 copecks per chetwert per month. M. De Hagemeister supposes that Turkey and the different ports of the Mediterranean require, at an average, an annual supply of 1,400,000 chetwerts, or about 1,050,000 quarters, of which 1,000,000 chetwerts, or 750,000 quarters, are furnished by Southern Russia, and principally shipped from Odessa. Wallachia and Moldavia are both very fertile in corn; and were tranquillity and good order introduced into them, and the free navigation of the Danube secured, Galacz and Brailoff would be two of the principal European grain shipping ports. (See the excellent Report of Hagemeister on the Trade of the Black Sea, pp. 96—114. Eng. trans.)

Exclusive of corn, the other articles mentioned as being exported from Odessa, find their way to the different markets in the Mediterranean. Those shipped for Turkey are iron, tallow, sail-cloth cordage, anchors for ships of war, butter, &c. The exports to Italy and other European countries are similar.

The importation of all foreign articles into the Russian dominions on the Black Sea and the Sea of Azoff is confined to Odessa, Theodosia or Kaffa, and Taganrog. The import trade is, however, of inferior importance when compared with the export trade. The principal articles are sugar and coffee, dye woods, wine and brandy, cotton stuffs and yarn, woollen and silk manufactures, spices, cutlery; oranges, lemons, figs, and other fruit; lemon juice, oil, tin and tin plates, dried fruits, paper, silk, specie, &c.

Odessa, in addition to its great and rapidly increasing trade with Constantinople and the countries on the Mediterranean, has a considerable trade with Redout-kalé at the mouth of the Phasis, and with Trebisond and several ports on the south coast of the Black Sea. Georgian and Armenian merchants are already considerable purchasers at the Leipsic and other German fairs; and civilisation is beginning to strike its roots throughout all the extensive countries between the Black Sea and the Caspian. It is probable that, at no very remote period, the Phasis will be frequented by British ships; and that our merchants, without any enchantress to aid them, and depending only on the superior cheapness and excellence of their goods, will be hospitably received in the ancient Colchis, and bear away a richer prize than fell to the lot of Jason and his compeers.

Epochs in the Trade of the Black Sea.—Depth of Water.—Difficulty of Navigation, &c.— The trade of the Black or Euxine Sea was of great importance in antiquity. The shores of the Crimea, or Taurica Chersonesus, were settled by Milesian adventurers, who founded Panticapæum and Theodosia. The exports thence to Athens were nearly the same as those which are now sent from Odessa and Taganrog to Constantinople, Leghorn, &c.; viz. corn, timber, and naval stores, leather, wax, honey, salt fish, caviare, &c., with great numbers of slaves, the best and most serviceable that were anywhere to be met with. The Athenians set a very high value upon this trade, which supplied them annually with about 400,000 medimni of corn; and to preserve it they carefully cultivated the alliance of the Thracian princes, and kept a garrison at Sestus, on the Hellespont.—(See the authorities in *Anacharsis's Travels*, c. 55.; and in *Clarke's Connection of the Saxon and English Coins*, pp. 54—64.) During the middle ages, the Genoese acquired an ascendancy on this sea, and laboured with pretty considerable success to monopolise its trade. Their principal establishment was at Caffa, which was the centre of a considerable commerce. But the conquest of Constantinople by the Turks, in 1453, was soon after followed by the conquest of Caffa, and the total exclusion of European vessels from the Black Sea, which became in a great measure unknown. This exclusion was maintained for about 300 years, or till it was opened to the ships of Russia by the treaty of Kainardgi in 1774. The Austrians obtained a similar equality of privileges in 1784; and British, French, &c., ships were admitted by the treaty of Amiens. There were, however, some restraints still kept up; but these have been abolished by the late treaty between the Turks and Russians in 1829; and for commercial purposes, at least, the Black Sea is now as free as the Mediterranean.

Notwithstanding the number of English and other European ships that have visited this sea within the last 20 years, its geography is still very imperfectly known. A notion seems to have been long prevalent, that it was not only stormy, but also infested with numerous shoals. Polybius, indeed, contends that, owing to the vast quantities of alluvial deposit brought down by the Danube and other large rivers that fall into the Black Sea, it was gradually filling up, and would become, at no very remote period, an immense morass! Dr. Clarke seems to have espoused the same theory. But, how probable soever it may appear, extremely little progress has hitherto been made towards the consummation described by Polybius. Instead of being shallow, the water is for the most part remarkably deep; with a bottom, where soundings have been obtained, of gravel, sand, and shells. A strong current sets from the Black Sea, through the Bosphorus, or Canal of Constantinople, into the Sea of Marmara, and from the latter through the Dardanelles, which it requires a fresh breeze to stem. This current is said to be sensibly felt in the Black Sea, 10 or 12 miles from the Bosphorus; and it

may probably carry off some of the mud brought down by the rivers. (See *Tournefort's Voyage du Levant*, Lett. 15, 16.; Art. 9. in No. I. of the *Journal of the Geographical Society; Macgill's Travels in Turkey*, vol. i. p. 245., &c.)

The navigation of the Black Sea has been represented by most modern and all ancient writers as exceedingly dangerous. We believe, however, that there is very little foundation for the greater number of the statements on this subject. It is said to be particularly subject to dense fogs, and to currents; but the former are prevalent only at particular seasons, and the influence of the latter is not greater than in many other seas which are not reputed dangerous. Tournefort, one of the best and most accurate of travellers, considers the navigation of the Black Sea as safe as that of the Mediterranean: —"*Il n'a rien de noir, pour ainsi dire, que le nom: les vents n'y soufflent pas avec plus de furie, et les orages ne sont guères plus frequens que sur les autres mers.*"—(Tome ii. p. 164. 4to. ed.) Dr. Clarke (*Travels*, vol. ii. p. 387. 8vo. ed.) affects to doubt this: but he assigns no grounds for his opinion; and who would think of putting his authority in competition with that of Tournefort? Indeed the accuracy of the statements of the latter has been fully established by the recent reports of Captain Middleton and other able officers who have navigated this sea. But, though without "a hidden danger," any sea would be dangerous to the Greek and Turkish pilots, by whom the Black Sea has been principally navigated. If the progress of navigation were to be estimated by its state amongst them, we should have to conclude that it had been stationary from the æra of the Argonauts. They seldom venture out of sight of the coasts; they have neither charts nor quadrants; and hardly even know that one of the points of the needle turns towards the North!—(*Tournefort in loc. cit.*) There is not, certainly, much room for wonder at shipwrecks being frequent among vessels so navigated. On leaving the Black Sea, the greatest difficulty is in making the Bosphorus. "The mountains," says Mr. Macgill, "are all so much alike, that it is difficult to determine which of them is at the entrance, until you are within a very few miles of the coast: then, with a fair wind, you are on a lee shore with a lee current; and if you make a mistake, destruction is almost inevitable. The Turks have two light-houses at the entrance; but unless you see them before sunset, they are of little use: in the forests on its borders, great quantities of charcoal are made, and the lights from it bewilder, and often mislead, the unhappy mariner.—(i. 245.)

From the vast quantity of fresh water poured into the Black Sea, the saline particles are so much diluted, that, with a slight frost, the surface becomes covered with ice; hence, during a great part of the year, hardly any navigation is attempted. The vessels that resort to Odessa seldom arrive at that port before the latter end of May; and those whose cargoes are not completed before the end of October, more frequently wait the return of spring, than adventure to encounter the dangers of an autumnal or winter voyage.

At Taganrog the frost commences earlier, and continues longer, than at Odessa; so that there are scarcely more than 4 or 5 months in the year during which the Sea of Azoff can be safely navigated.

OIL (Fr. *Huile*; Ger. *Oel*; It. *Olie*; Lat. *Oleum*; Rus. *Maslo*; Sp. *Aceite*). The term *oil* is applied to designate a number of unctuous liquors, which, when dropped upon paper, sink into it and make it seem semi-transparent, or give it what is called a greasy stain. These bodies are very numerous, and have been in common use from time immemorial. Chemists have divided them into two classes; namely, *volatile* and *fixed* oils. We borrow from Dr. Thomas Thomson the following statement with respect to these bodies: —

1. Volatile Oils, called also *essential oils*, are distinguished by the following properties:— 1. Liquid, often almost as liquid as water, sometimes viscid; 2. Very combustible; 3. An acrid taste and a strong fragrant odour; 4. Volatilised at a temperature not higher than 212°; 5. Soluble in alcohol, and imperfectly in water; 6. Evaporate without leaving any stain on paper.

By this last test it is easy to discover whether they have been adulterated with any of the fixed oils. Let a drop of the volatile oil fall upon a sheet of writing paper, and then apply a gentle heat to it; if it evaporates without leaving any stain upon the paper, the oil is pure; but if it leaves a stain upon the paper, it has been contaminated with some fixed oil or other.

Volatile oils are almost all obtained from vegetables, and they exist in every part of plants,— the root, the bark, the wood, the leaves, the flower, and even the fruit; though they are never found in the substance of the cotyledons; whereas the fixed oils, on the contrary, are almost always contained in these bodies.

When the volatile oils are contained in great abundance in plants, they are sometimes obtained by simple expression. This is the case with oil of oranges, of lemons and bergamotte; but in general they can only be obtained by distillation. The part of the plant containing the oil is put into a still with a quantity of water, which is distilled off by the application of a moderate heat. The oil comes over along with the water, and swims upon its surface in the receiver. By this process are obtained the oils of peppermint, thyme, lavender, and a great many others, which are prepared and employed by the perfumer: others are procured by the distillation of resinous bodies. This is the case in particular with oil of turpentine, which is obtained by distilling a kind of resinous juice, called turpentine, that exudes from the juniper.

Volatile oils are exceedingly numerous. They have been long known; but as their use in chemistry is but limited, they have not, hitherto, been subjected to an accurate chemical investigation. They differ greatly in their properties from each other; but it is impossible at present to give a detailed account of each.

1. The greater number of volatile oils are *liquid*; many, indeed, are as limpid as water, and have

none of that appearance which we usually consider oily. This is the case with the following; namely, oil of turpentine, oranges, lemons, bergamotte, roses.—Others have the oily viscidity. It varies in them in all degrees. This is the case with the oils of mace, cardamom, sassafras, cloves, cinnamon.— Others have the property of becoming solid. This is the case with the oils of parsley, fennel, aniseed, balm.— Others crystallise by slow evaporation. This is the case with oil of thyme, peppermint, marjoram. —The oil of nutmegs has usually the consistence of butter. This is the case also with the oils of hops and of pepper.
